Again we are both in the saddle riding through one of the sand rivers which intersect many of our Southern woods. The aroma of the pines is wafted to our nostrils by the wind which is a trifle cool perhaps, for a Southern early April. Now the ground commences to rise, now getting too stony for equestrianism. We are at the foot of the only hill of size for miles around, and on it we expect to find a few covies of quail, or as they are termed "down south" partridges. Dismounting and securing the horses each to an adjacent tree we commence the search for *Oryziz*, Jack and I about twenty yards apart, and the dog ranging on Jack's "off" side, and circling in advance. Shortly the stony character of the ground is changed, short grass with covert briar patches here and there upon the soil give a more agreeable mode of locomotion than that afforded by the treacherous boulders. Now a sweet, soft, delicious perfume is wafted passed us by a cool breeze, a step farther and we are among them, the blue-eyed Southern violets carpeting the ground as far as the eye can reach. Here and there are other species of pretty little flowers scattered among them. The fragrant yellow jessamine bushes spring up on all sides, a spring comes bubbling from under a mossy boulder, and goes dancing in its own little channel, seeming like the fabled perfumed water of the fairy tales of our younger days as it glides along almost hidden by the wild flowers on its banks. We halt here for a moment to quench our thirst, the eye roams down the hill. As far as the eye can reach, save one or two church spires which rise above the pines in the distances and proclaim the distant presence of the village, all is one mass of pine trees, which are seemingly lost in the skies, as the blue horizon engulfs them.

Sufficiently rested, we commenced to hunt with a will, our feet sinking at every step in the most beautiful and luxuriant of nature's carpets. "Steady, Dick," I hear Jack exclaim, and at last we have the first point of the afternoon. With Jack to the left and I to the right of the dog we advance step by step with him, a loud whirr of wings, and from beneath their jessamine cover a fine bevy take wings, a simultaneous report on the part of Herbert and myself as we pick out our birds on our respective side, then bang! bang! go our second barrels, and we mark the quail down in the distance. The pointer is at charge, and we reload, Herbert quietly remarking that he has made a double shot, and his birds lie among a patch of pansies. I have seen one of my birds drop and point out the direction accordingly. Dick is ordered to retrieve, and the beautiful birds are one by one picked out by their flowering beds and transferred to the deep and not odoriferous flavor of the game rack. We now direct our steps to where we marked the bevy which is a short distance on a level portion of the hill, and we expect great sport with the single and double rises. A step more on my part, a bird flushes from beneath my feet and is dropped with my best wishes within twenty yards. Now Dick points, and Herbert stepping up makes a glorious miss—the quail, like a bullet, is quartering past me. I fire, but he still goes on and is lost to sight for a second behind some tree trunks, and comes for an instant in view before disappearing in a clump of briars, but that instant is fatal to him, and a snapshot from my gun kills him at about sixty yards. Tipping up the breeches of my gun to insert fresh cartridges Dick makes another point, two birds rise, one Jack kills, the others fly straight past me "so near and yet so far," for before I can lock the gun she is out of sight. A few yards further on the dog points again, Herbert calls me and offers me the shot, which I accept; and putting the bird up miss it beautifully and my companion does likewise. At the two last reports two or three quail, probably the last of the bevy, flush of their own accord, and depart for pasturage unknown, and where we have not the inclination to investigate and proceed to hunt up a fresh bevy. Two more flocks are found during the afternoon, and our game pockets possess quite respectable proportions, bagging nineteen quail between us.

The sun has half disappeared below the horizon when we regain our hacks, and the rather chill evening air causes us to proceed rather briskly homeward through the pine woods, now gloomy with the approach of night, for the sun has quite sunk below the distant tree-tops; the lights of the village appear in the distance. Arriving at this, and taking the shortest cut through it we pass through more darkness and scattered cabins, and then arrive at the hotel grounds. Riding to the stables and leaving the horses, and seeing that Dick has his evening meal we walk toward the mass of windows and light which denotes the hotel. We enter the office, deposit the birds with injunctions to have them served for dinner next day.

FRANK WARWICK.

For Forest and Stream.

## BRUNO, THE RANCHE DOG.

BY J. C. BURNETT.

GOOD duck shooting is exhilarating sport—perhaps no more so in Colorado than anywhere else—but I never found it more to my liking than that we unexpectedly discovered on the plains near the mountains, some ten miles south of Denver. My brother and I were spending a few weeks at a rancho there, preparing for extended trips to South, Middle and Estes Parks, and other attractive places, getting acclimated and accustomed to pony riding, and providing the essentials for six months camp life, hunting, fishing and sight-seeing.

Our six weeks' stay at that rancho is an illuminated recollection, a splendid picture, as it were, in the wonderful academy of design, commonly known as memory. Looking back to it now, we see the grand old Rockies in the distance, the un-

dulating plains near by, and here and there a man with dog and gun in quest of game along the rapid streams. The river and creeks near, and a pretty little lake two miles off, were frequent resorts in the month of April for green and blue-winged teal, dusky and gray ducks, pin-tails, fish ducks, brants and geese, and other aquatic fowls. There were also great numbers of snipe, and among them the beautiful white and black American arsets. In all my rambles there, however, I never found any jack snipes.

A short distance from the cabin one drizzly day, I "scooped" nine ducks at one shot, much to the amazement of the rancho dog, who had recently taken a wonderful fancy to my gun, and the, to him, strange work it did bringing down game. The dog was a cross between a Newfoundland and a shepherd, large, shaggy, generally good-natured, ugly in a rough and tumble encounter with any opposing forces, and, for his opportunities, quite intelligent. On every occasion, and frequently when his untutored nature made him a nuisance—for instance when hunting grouse with my pointer—he would notice preparations for a hunt, sneak off unobserved, and join me a mile or so from home, where I could not control him. He was such a staunch friend though, ever ready for a chase or a fight, and such a reliable companion at night in camp I could seldom refuse to let him come along, even when his services were not needed, and when his presence was sure to spoil any sport which required a good nose and careful action. His influence upon a pointer I had brought with me was also bad. This, together with the fact that the pointer soon lost his nose, or scent, caused, it was said, by the rare atmosphere, deprived me of valuable assistance in hunting grouse. The rancho-dog was famous for catching skunks. He could find one of those odorous cats and jerk the life out of it quicker than any dog in the country; and he did it without despoiling his coal-black coat or tainting himself with the suffocating perfumes of *mephitis*. How he did it was a mystery. Ponto, the gentle and high-toned pointer, was, alas, induced by Bruno to try the same experiment, but he blundered fearfully, and for a week was exiled from the little community, living in disgrace and retirement in the bushes along the river. There he made the acquaintance of some beavers, and succeeded with Bruno's help in driving them out of their retreat one day and killing two of the young ones—all of which, of course, was very bad business for a pointer to be engaged in.

One morning early, I tied Bruno in the corral, and with Ponto following, set out on a pony for a few hours shooting at the lake, and on a creek a mile north of it. The sky was a little cloudy, but promised well, and ducks were flying overhead as soon as it was light.

The two miles between our rancho and the lake were partly up a steep divide, cut with breaks and ravines, and partly on an elevated piece of table-land, or *mesa*, from which the view to the mountains, fifteen miles off, was beautiful beyond any attempt to describe with pen or pencil. On the level ground I gave the pony the rein, a touch of the spur, and went on a gallop, inhaling the pure, crisp air with fuller inspirations for the benefit of the lungs, and feasting my eyes upon the scenery limned against the sky in the beautiful West. The blood bounded through arteries and veins with the invigorating exercise, and the mind was aglow with the stimulating influences of the inner life and the outer world.

Arriving in sight of the lake, I was delighted to see it literally covered with ducks, while flocks were arriving in detachments from distant fields every few minutes. The scene was a capital one for a sportsman, and I thought no more of the mountains I had been studying, clothed as they were in royal purple, their gorgeous old domes gleaming and flashing in the morning sun. Turning to follow the leeward side of a small ravine to the south end of the lake, I was dismayed to see the rancho-dog coming toward me, capering and bounding in the most exuberant spirits, as if he had arrived just in time to be of eminent service, and determined to stand by me in any emergency! To say that I was provoked and angry is stating the fact pleasantly. All the excellent sport, which seemed so certain to follow a few minutes before, was now apparently ruined by the overflowing good nature of an unmanageable cur.

To make matters reach a crisis as quickly as possible, he espied the game, and went helter-skelter down to the shore and into the water. A cloud of ducks rose in the air, and I yearned for the power of one of the mythical deities, that I might transform the dog into a statue of marble, or even change him into a stump that would do to hide behind in getting a shot. But there was no help for it. The old dog knew no such thing as minding, and besides he seemed to wonder what ducks had wings for if they were not to fly with. So, tying the pony to a stake at the mouth of the ravine, I determined to make the most of what opportunities I should have. I soon found a hollow in the ground, nearly hidden by grass and weeds, where I concealed myself, and, making Ponto lie close, awaited events.

A stiff breeze had sprung up, and on the wings of this the great cloud of ducks bore down toward me. As they turned at the south shore to fly back, some of them already overhead, and loud with the discovery of myself and the dog, they came up abreast of the wind, and in such confusion that they struck each other's wings, vaulting upward and diving below again, to get room for freer progress. There was, in fact, a little too much confusion. It was difficult to decide where to shoot, although most anywhere would have been certain of execution. Selecting a line where there was the greatest hubbub, I fired two shots in instant succession. Whew! what a fall was there, my fellow sportsmen! Six ducks "tumbled to the racket" dead, and as many more wounded fluttered to ground and water. Ponto gathered up the slain, proud of his education, while Bruno, excited by the dring, swam ashore and scampered to the other end of the lake, determined not to let the birds rest there.

Nothing could have happened more fortunately. The air was full of ducks, each individual stretching his neck to the utmost and quacking the wild alarm, while snipes and gulls from off the prairie, whistling sand-pipers and noisy kill-deers, shrieking avocets and croaking bitterns, added their notes of warning to the general consternation. It was a Babylon of splendid confusion for a duck hunter, and one there was who enjoyed it. In a few minutes the ducks came round again, tacking against the wind as before, and I got another pretty shot, bringing down five. Ponto had his hands, or rather his neck, full of business, and Bruno slashed about like a mad dog, utterly beside himself with his wonderful exploits. If the ducks came down to the water in the middle of the lake, he swam out and scared them up; if they flew to the other end, he considered it an especial duty

to get around there as quickly as possible and drive them back. Ponto sat on his haunches near me when he had brought in the game, looking intently at the old dog, turning occasionally to me with a comical wink, apparently wondering what I thought of the performance, and whether it was according to rule to cut up such fantastic tricks before high heaven when there was game about and his master there with the gun.

Again and again the flocks, now scattered and thinned by desertion, came sailing overhead, and one and two and three at a time tumbled into our possession. In the course of two hours there were thirty-five ducks and five avocets piled up on the ground by the side of my hiding-place. Ponto got weary catching the wounded ones that fell on land, and finally, when the ducks were nearly all gone, lay down to lick his wet hair and paws, and receive the certain praise that was sure to follow good behavior. Bruno came up cautiously, uncertain whether he would get blame or thanks; but when he too was patted in recognition of services rendered, his joy was as boundless as his energy had been before, while at the water's edge he pranced and sniffed the breeze as if he was sighing for other world's to conquer.

To kill more would have been useless slaughter, so I tied the birds together by making a needle of a stick and drawing a string through their bills, threw them on the horn of the saddle, and returned to the rancho. The ducks were in excellent condition, apparently just from the rice and celery fields in the distant South, where they,

"Feeding high and living soft  
Grow plump and able-bodied."

There were several savory roasts and stews at our cabin during the two or three days following, and many were sent to neighboring ranches, where they were prized as highly as at our own. Other days of jolly recreation followed, and for a month we feasted on snipe and ducks and the plump curlews we found masquerading one at a time on the prairie. After that our attention was given to bigger game, and the grander scenery of the Pacific slope of the Rockies.

For Forest and Stream and Rod and Gun.

## AN INDIAN ROMANCE OF THE REVOLUTION.

I WAS in my oatfield to-day watching the harvesters at work, when the reaper struck a stone which I picked up. It was about the size of a man's head, and underneath was found a broken piece of crockery, evidently the bottom of a plate, and on it a picture of a canoe propelled by three Indians. What would I give to know the history of him who once feasted from this broken plate. On this spot, now gleaming with a golden harvest, once stood an Indian cabin. The owner of the land, who then lived here was a beautiful maiden of the Chickasaws—Rhoda Gunn, famed throughout the nation for her wonderful beauty. She was descended from a Virginia gentleman named Gunn, through whose veins coursed the proud blood of the cavaliers. During the war of the revolution her father was a staunch loyalist, who fought as bravely for the crown as any cavalier in the days of Charles the First and the Roundheads. With the triumph of the American cause Gunn scorned to dwell among those whom he considered rebels. He gathered together property, which consisted chiefly of slaves, and sullenly departed, leaving Virginia and civilization, to seek a home among the Chickasaws. This tribe had been friends of the English, and had been their allies in the wars against the French. Gunn was kindly received, and, being adopted into the tribe, still further identified himself with them by wedding one of their maidens. It is said that the royalist exile always celebrated the birthday of King George, and allowed no sound of merriment on his place on Independence Day. He died in the year 1826, leaving a large estate to his children. A portion of the inheritance of the writer was left by Gunn to his granddaughter Rhoda, the belle of the Chickasaws, and one of the sweetest wild flowers of the forest.

When the white man entered the Chickasaw territory, Rhoda Gunn was in the first dawn of womanhood, and her wealth and superior attractions drew many an adventurous land speculator to her feet. But in vain the white man wooed the haughty Indian maid; she looked upon them as the race who had wronged her grandsire, and she had inherited all of the elder Gunn's contempt for the race of rebels. Although many a Saxon suitor sought her hand, and poured into her ears the old, old story, they sighed in vain. The grandchild of the faithful loyalist was to be won by no carpet knight. But her smiles and her love were given to a dusky warrior of the Chickasaws; one who had nothing to offer his lady love but a strong arm, a brave, true heart that had never forsaken a friend or quailed before an enemy.

And there upon the spot where my reapers were gleaming to-day they dwelt, and there is nothing left of the home of the proud beauty but this relic of a broken plate which lies before me. And but few who are now living know anything of the Gunn family; or who will care to remember the traditions of the race that welcomed the proud royalist to their hearts and home. Gunntown, on the Mobile and Ohio railroad, was named for the elder Gunn, yet even its inhabitants are unacquainted with the origin of its name.

This is a true history, not merely a romance of the forest, although there is so much romance in it. But few of us are left who were here when the red man occupied this land. With us will pass away the kindly memories of their race. Let us recall those memories while we may. The savage of the far West to-day is not the Indian I knew in my childhood, for, kind reader, I was not born in the United States, though I was born near the spot where I now reside. I was born a subject to Ish-ta-ho-to-pa and Puc-ca-lah, the king and queen of the Chickasaws, and in my heart I am a loyalist to this day. The Chickasaws were the allies of the white man; a pure, brave and virtuous race when the white man came amongst them. The civilizing influences of Christianity corrupted and destroyed them. They were cheated out of their land and sent westward, where they are still swindled and persecuted,

"Let politicians grate  
Of equal rights which men never knew—  
I have a love for freedom, too."

PROUS JERMS.

Honesty and candor are not only the most moral but the most effective buttresses of business. B. T. Babbitt does not claim a rich, strong perfume for his Toilet Soap, but he does say, and defines contradiction in it, that no toilet soap is equal to it in absolute purity and excellence. The materials themselves communicate a delicate odor, like that of a bank of violets in spring time.—[Adv.]

## Natural History.

### THE GIANT SQUIDS.

At a recent meeting of the Connecticut Academy of Arts and Sciences, Prof. A. L. Verrill, of Yale, made some very interesting remarks upon the three additional specimens of gigantic cuttlefish, discovered during the past year upon the American coast.

These large cephalopods all belong to the genus *Architenthis*, a specimen of which—and one of the most perfect yet found—is now on exhibition at the Aquarium in this city. One of the principal characters of this genus, and a point in which it differs from all other squids, is the presence on the two longer arms of suckers, by which it is enabled to fasten together its two wrists, so called, so that the two long arms may be used together, and their power thus greatly increased. The smaller squids, wanting these suckers, are obliged to use the long arms independently. It is generally known that near their extremities the long arms become wider and oarlike in shape, and are here furnished with large sucking disks, the margins of which are raised and serrated. These serrations are strong and sharp, and when the disks are applied to the skin of the cuttlefish's prey the atmospheric pressure forces them into it, and the victim is so firmly held that it has no hope of escape. Such suckers as these, however, would not answer when the flesh which is to receive them is the squid's own, and for this reason the rims of the sucking disks which hold the long arms together are without the serrated edges of the more distant suckers. One more condition, however, is necessary in order that these proximal disks shall fulfill their office. It is well known that even though a sucker may resist all vertical pressure, it can often be slipped to one side or the other with little effort. Thus the receiver of an air pump, although it may resist any effort to raise it directly, can easily be slipped to one side and then removed from the floor upon which it rests. The smooth disks of the long arms, if they acted directly on the soft and viscid flesh, would be very likely to slip when any lateral pressure was excited, and in this way their usefulness would be, in a great measure, lost. To obviate this difficulty the long arms of *Architenthis* are furnished with rows and clusters of small protuberances, or tubercles, which are so placed as to fit into the corresponding smooth suckers on the opposing arm, thus securing the union of the two arms beyond the possibility of any slip. This genus has other well marked characteristics, but they are of little general interest and need not be enumerated here.

Of the three specimens remarked upon by Prof. Verrill, the first was discovered in a very imperfect condition on the coast of Newfoundland nearly a year ago. It had suffered severe mutilation before it was discovered, having been partially devoured by foxes and sea fowl. Its head was gone, and all of the arms were gnawed down to within about two feet of the body. What remained of the body and tail measured five and one-half feet in length. The absence of the head, the arms, and a portion of the tail, that is to say, of the most characteristic part of the body, rendered it uncertain to what species the monster belonged.

The second specimen was discovered by Prof. Verrill during the past summer—preserved in alcohol in the museum at Halifax—and appears to be an entirely new species, though a careful examination shows it to possess the generic characters of the genus *Architenthis*. It is much smaller than any known species of this genus, its body being only about twelve inches long, while the total length of body, tail and outstretched arms is altogether less than four feet. One remarkable fact in regard to this specimen is the extreme width of the tail. This member measures thirteen inches in breadth and is thus wider than the body is long. This too is the only individual of the genus yet found in which the eyes are perfect. Fishermen, who have to deal with animals with which they are but imperfectly acquainted, and especially when these animals are as terrible in appearance as the great squids, generally destroy the eyes at once if possible. They seem to think that if they can destroy the creature's sight its power for harm will be lessened, and they are very likely to stick their boat hooks into the eyes and thus destroy them. This was the case with the specimen now on exhibition in this city, to which reference will be made below. The eyes of this small species was quite remarkable from their shape, being oval instead of round, as would have been expected. Their color in life was probably a dark green or greenish black. Of the specimen at the Aquarium less need be said, as probably all our New York readers will have seen it before this reaches them. It is of much importance, from a scientific point of view, as it belongs to a species the soft parts of which have never before been seen by any naturalist. *Architenthis princeps*, Verrill, was described some time since from a pair of jaws which had been taken from the stomach of a sperm whale, and the capture of this New York specimen is a very happy occurrence, as it serves to set right one or two points about which naturalists are at fault. The jaws of this species were very much larger than those of any other large squid, and it was supposed that the animal itself must be proportionately large. This, however, proves not to be the case, as *princeps* is just about equal in size to *monachus*, a species with very much smaller jaws.

The capture of fourteen specimens of these remarkable cephalopods within the past few years indicates that they are

by no means so rare as has hitherto been imagined, and the probabilities are that within a few years all of our larger museums will be supplied with specimens. The fishermen of the Newfoundland coast have hitherto been in the habit of cutting up these creatures for bait or for dog meat, but in view of the prices which they have lately brought, it is doubtful if many more will be used for those purposes.

Of the fourteen individuals of this group which, as above remarked, have recently been secured, thirteen have been taken upon the Atlantic coast and one on the Pacific. The genus seems to be, about this continent at least, quite boreal in habit, and the specimens secured have almost all been taken on the shores of Newfoundland.

**ALEPIDOSAURUS.**—Two weeks ago we printed in our paper some reference to the capture of a specimen of this exceedingly rare fish, which was recently brought to Mr. Eugene G. Blackford, of Fulton Market. Since then the inquiries of Mr. Blackford respecting the habits and habitat of this fish have elicited much interesting information which is contained in the subjoined letters. We are indebted to Mr. Blackford for handing them over to us; and we may as well say here that Mr. Blackford is daily accomplishing more for science in bringing his strange specimens to the attention of naturalists than any other man in the country. It is fortunate that we have a gentleman in his position whose proclivities lead him to take advantage of the unusual opportunities for the study of ichthyology which his business affords:

SMITHSONIAN INSTITUTION, WASHINGTON, Oct. 22, 1877.  
MR. E. G. BLACKFORD:

Dear Sir.—Your favor communicating the desired information respecting the capture of the *Alepidosaurus* has come to hand, and interested me very much. I was scarcely prepared for the discovery of the fish in so high a latitude as the northern edge of the "Grand Bank," but nevertheless am not much astonished at it. The *Alepidosaurus* are among those fishes which inhabit the very deep seas, the temperature of which varies comparatively little with latitude, and which may therefore be looked for in almost any region where the depth of water and other conditions are suitable. Perhaps you may be interested in some facts respecting the range of this family, and this I take pleasure in giving.

The *Alepidosaurus* have been variously arranged in the system by naturalists. At first they were quite generally regarded as being related to the Scomberoid fishes (mackerels, hair-tails, etc.), but the absurd idea that they were related to the Silurids (catfishes) was at one time seriously put forward by Dr. Gunther, the author of a complete work on fishes. In 1861, however, Dr. Gunther and myself (Proc. Acad. Nat. Sc., Phila., p. 152) independently recognized that they were most nearly related to the Paralepidids, and in a much more remote degree to the Salmonids; but they form a distinct family, represented by five species confined mostly to the deep seas. You doubtless noticed the "looseness" and flaccid condition of the fish you obtained; such a condition is a pretty certain feature of deep-water habitat, and is the expression of the great pressure to which the animal is subject under the conditions of its habitat. When in such deep water it was undoubtedly as rigid and firm as fishes generally are, and only under an unaccustomed slight pressure does a laxity of the parts of the body supervene. The family is represented by two genera and at least four species.

The earliest scientific description of a species of the family was given by Steller, but published for the first time in 1811 in Pallas' "Zoographia Russo-Asiatica," in an incidental notice in connection with *Salmo Japonensis*. Steller obtained a dried specimen while at the Carib Islands, and gave a moderately good description, naming the fish *Playgodus*. Next, the Rev. Mr. Lowe, in 1833, discovered a representative of the family at the island of Madeira, and gave it the name *Alepisaurus Jeroz*. Since then Valenciennes, Gus Richardson, Johnson, Rey, Gunther and myself have obtained specimens, and the following species are now known:

1. *Alepidosaurus Jeroz*. Found off the Island of Madeira, the Grand Bank, and, if Gunther's determination is correct (which is very doubtful) off Van Diemen's Land. Gunther records seven specimens preserved in the British Museum.

2. *Playgodus borealis*. Found at the Carib Islands and in Puget Sound.

3. *Playgodus serro*. Found off Monterey, Cal.

4. *Playgodus altivelis*. Found off the Island of Cuba.

The species of *Alepidosaurus* has nine (or ten) rays in the central fins, and those of *Playgodus* thirteen rays in the homologous fins.

I have been told that *Caulopus borealis* sometimes ascends into comparatively shallow water in pursuit of the salmon, and is known as the "Salmon Killer," but this requires verification.

The specimen of *Alepidosaurus Jeroz* sent by you must have been not far from six feet long when entire. The head formed over nine inches of this length, the body about four feet, the short ray of the caudal about six inches, and the external rays of the latter projected far beyond, but being broken their exact dimensions cannot be ascertained; the height (from back to belly) was about five inches; the dorsal fin had 41 rays, and was high and sinuous, the 4th ray being  $9\frac{1}{2}$  inches long; the 7th, 14; the 16th, 9, and the 21st, 10.5. The anal has 16 rays; the caudal 19, besides the supplementary ones (9, 1, 9, 1, 8); the pectoral, 14; and the ventral, 9. The pectorals are 8 inches long, and the ventrals 4.

I hope intensely that you may be able to secure for the Institution specimens in good condition of this species and other deep sea forms. Mr. Brevoort has written to me that he has identified a fish caught by a Dutch sea captain in 1679, on a voyage to America, with this species, and this is undoubtedly the first recorded example of the fish.

THEODORE GILL.

The following letter was received by Mr. Blackford in response to his inquiries respecting the circumstances under which the fish was taken:

GLOUCESTER, MASS., October 13, 1877.

MR. E. G. BLACKFORD:

Sir.—The strange fish that was sent to you was caught on the northern edge of the Grand Banks, in a part of the ground called the Gutty, in 325 fathoms of water, on a trawl, by one of our halibut catchers, on a piece of ground that, as near as we can understand, represents a valley between two mountains, as the schooner anchored in 175 fathoms of water, and within one hundred yards from her stern, she had the depth of water mentioned—325 fathoms; they also caught 16 sword fish on the same trawl, and the captain told me personally that they hauled up trees, such as are generally to be found on this bottom, so large that they could not get them into their dories, and furthermore he said that the bottom must be just the same as if they were in the woods on shore; for it seemed that a part of their trawl would catch in the branches, and then a short distance would drop down in clear spots, and in the ravines there would be plenty of large gray halibut, and occasionally a

fish of the kind sent you, this being the third or fourth one we have had brought home this season. We also had another strange fish which should have been sent to you, but it was so far decomposed that we could not do so. But if at any time there is any fish caught that I do not know you shall certainly have it sent to you.

Respectfully yours, GLOUCESTER FISH CO. OAKES.

### PROFESSOR COPE AND HIS DISCOVERIES IN TEXAS.

THE HORSES OF OLD—THE ANTE-DILUVIAN COWS—HOGS OF TODAY WITHOUT THE CLOVEN HOOF.

TEXAS has lately been favored with a large delegation of members of the American Association of Science, which convened at Nashville, Tennessee. They passed rapidly on the ears through the country, staying less than half a day at Austin, and remained only about a week in the State, with the exception of Prof. E. D. Cope, the eminent paleontologist of the United States Survey of the Territories, who remained in Texas several weeks. He has just left Austin for his home at Philadelphia. The specialties of the Professor are vertebrate fossils, also fishes and reptiles. He has been very successful in obtaining vertebrate fossils in the recent tertiary (Pliocene) of South Western Texas on the rivers Frio and Medina. Of these fossils he has sent to Philadelphia fifteen boxes, a large portion of which are mammalia. Among them are several species of the horse and one species of the bovine genus. Prof. Cope has had a party collecting these bones during the summer. Twenty years ago it was generally thought that horses were first introduced into America by the Spaniards, but later investigations prove that both the horse and cow dwelt here at least as soon or before the creation of man, but they were of different species from ours. In digging wells in Washington County in this State at the depth of about 30 feet, bones are frequently met, among which those of the equine species are not uncommon.

About seventeen years ago a gentleman at New Braunfels gave me several horse teeth which were found at the depth of about 20 feet in the tertiary rocks a few miles south of the town. From the size of these teeth the animal must have been nearly as large as the modern horse, but of a different species.

Prof. Cope also visited the region northwest of San Antonio, near the head waters of the Llano and San Lake Rivers. The rocks here are limestones of the Cretaceous period. These rocks have marine shells, but no bones of the vertebrate were found. Pecaries, or Mexican hogs (*Dicotyles torquatus*) were quite abundant, being frequently met. A few years ago they lived as far west as the Brazos River, but now they are seldom if ever met much further east than they were lately found by Prof. Cope. Once the Pecary was said to have lived as far north as Arkansas. It may be that some of them yet live in the timbered region of south-eastern Texas. I never met with any in the northern part of Texas, but I have been told that they are not found in New Mexico.

Amid the rocks of the hills on the head waters of the Llano, Prof. C. saw a black and gray squirrel, or spermophile (*Spermophilus Buckleyi*, Slack.) which was described by Dr. Slack in 1861, from a specimen which I obtained in Burnet county. They are about the size of the common black squirrel. In habits they are gregarious, dwelling in rocks and seldom climbing trees.

Perhaps the most important discovery made by Prof. Cope in western Texas is that of a domestic hog, with undivided hoofs similar to those of a horse. Nature in a freak first made one, and from that more came, and now they are quite numerous and raised for meat. The Professor has the skin and skeleton of one for his collection. This is one of the most important arguments known in favor of evolution, for here we have not only a new genus but probably a new order of animals evolved or created; but the first change was sudden not gradual. Might it not be called a new creation?

Austin, Texas, Oct. 23, 1877.

S. B. BUCKLEY.

**BIRDS' NESTS IN CURIOUS PLACES.**—Messrs. Holland and Holland pointed out that a bird's nest had been discovered in a coach-box. We have known of nests being discovered in very remarkable positions. The redbreast is the most freakish of all birds in this way. Several years ago a redbreast built its nest inside a human skull that had been left exposed in a burying-ground in the parish of Dysart, in Fifeshire. That burying-place was then little used, and it is now closed up. We have seen a redbreast's nest inside an iron tankard that had been cast aside as useless among weeds. At Balbrinie Saw Mills, in the parish of Markinch, a redbreast built its nest, and brought forth a healthy family within a few feet of a circular saw daily in motion. Another erected its "mossy house" in the heart of an azalia growing in a pot in a greenhouse at Balbrinie Gardens. We have seen one constructed within the sleeve of a workman's coat that had been left hanging on a tree; the workman, on making the interesting discovery, allowed his coat to remain on the bough, and the redbreast's labors proved fruitful. We have seen a sparrow's nest inside the cavity of an iron buffer of a railway wagon, and an oxeye's nest in a broken beer-bottle; while not long ago the nest of a thrush was pointed out to us inside the spout of a pump, but the frequent demand for water caused the thrush's efforts in nest-building in such a place to be abandoned.—Land and Water.

—There have recently been deposited in the South Kensington Museum, in London, six models illustrative of Pueblos, or cliff houses, cave dwellings and lowland settlements, which are found in Southern Utah, New Mexico, Colorado and Arizona. A similar series of models were on exhibition at the Centennial, and were no doubt noticed by many of the readers of *FOREST AND STREAM*.

—Additional specimens of both the male and female of the remarkable new eelid *Tachyglossus brevifili* have been secured in the mountains of Northern New Guinea by an expedition under the command of M. Laglaize, a young French naturalist.

—Cincinnati is about having an aquarium, and not only one of them, but aquaria are spoken about. The Cincinnati Aquarium Association seems to have taken the initiative, and has for rival the Zoological Garden people. Perhaps it would be wiser, for the present, to have but one aquarium in Cincinnati, then a single establishment might concentrate all the means and be a true attraction. An aquarium is something not built up in a day, requiring time, experience, and no small outlay of money.

**WILD CAMELS.**—The discovery made by Mr. Prjevalsky, the Russian traveler, that wild camels existed in the Loh-Noor districts of Thibet, is of singular interest. Whenever the rare opportunity presents itself of comparing the original type of an animal with such divergencies as always occur through domesticity, the study of such modified changes is of vital importance to the student of natural history. The popular information in regard to camels is often of the most erroneous character. The *habitat* of the camel is much wider than is generally supposed. In fact, the camel seems to thrive not only in temperate regions, but can withstand a cold climate. M. Prjevalsky states "that the wild camels differ but little from the domestic animals," and that of the four specimens in his collection, "the difference existing by the examination of their skulls almost alone showed where the divergence from the domesticated animals existed." It would be interesting if Professor Leidy or Marsh were to compare the structure of these wild camels with some of those fossil forms of llamas which have been discovered in our own country.

**ARRIVALS AT PHILADELPHIA ZOOLOGICAL GARDENS FOR WEEK ENDING WEDNESDAY, OCT. 24, 1877.**—Three salamanders, *Spelerpes bilineata*, presented; one salamander, *Spelerpes ruber*, presented; one pine snake, *Pterophis melanoleucus*, purchased; one black snake, *Rhacunan conditor*, presented; four prong-horned antelopes, *Antilocapra americana*, purchased; three Arabian sheep, presented; one beaver, *Castor canadensis*, born in garden; one banded ratsnake, *Orotalis horridus*, presented; one *Ca-alota rali*, *Porzana carolina*, presented; one alligator, *A. mississippiensis*, presented; one pinnated grouse, *Cardinalia capido*, presented; one alligator, *A. mississippiensis*, presented; one iguana, *I. tuberculata*, presented; one short-eared owl, *Brachyotus palustris*, presented; one red fox, *Vulpes fulvus*, presented; one naked necked iguana, *Iguana delticentris*, presented; one Java sparrow, presented; one zebu, *Bos indicus*, presented; one water snake, *Protonotus signatus*, presented; one hog-nosed snake, *Heterodon platyrhincus*, presented; one opossum, *Didelphys virginiana*, presented; one deer, presented; three Arctic foxes, *V. lagopus*, purchased; one sparrow hawk, *Falco sparverius*, presented.

ARTHUR E. BROWN, Gen'l Sup't.

## Fish Culture.

### HOW FAST DO TROUT GROW?

THIS question has engaged attention of late in these and other columns. There seems to be a difference of opinion, based upon observations made from different standpoints. There are various breeds of trout, as there are of cats and cows, and the localities which wild trout inhabit, as well as the methods of raising domesticated trout, have much to do with the rapidity of their growth. Fish culturists separate their trout according to their ages and stages of growth, and are therefore able to tell pretty accurately what weight a fish of a stated age will attain in a given time. Yet, as we have remarked, domesticated trout, in some localities, gain weight faster than in others, so that the evidence of a man's own eyes is not always sufficient testimony to establish a criterion. For instance, the well-informed Dr. Garlick, of Ohio, expressed his doubts in the last issue of *FOREST AND STREAM* of Dr. Hasbrouck's seven-inch, two-year-olds, and gave his reasons therefor. If we can determine that some domesticated trout grow as rapidly under certain conditions as some wild trout do under similar favorable conditions, then the two doctors may at once agree to disagree; for we have here before us the best of evidence, obtained from careful tests, that some brook trout will gain nearly a pound per weight per annum. The evidence adduced has already been published in substance; we copy it as printed:

In reply to queries as to the probable age of the mammoth trout found in the Rangeley Lakes, Prof. Agassiz emphatically declared that "no man living knew whether these six and eight pounders were ten or two hundred years old." To get some light upon this question, Shepard Page, Esq., President of the Quonset Club at Rangeley, conceived an ingenious device, which he at once proceeded to put in execution. Platinum wire was obtained, cut into one and a half inch lengths, flattened at one end, and various numbers were stamped on the surface from 1 to 4, also the numbers 70, 71, 72, to denote the year. As trout were captured they were weighed, one of these tags was passed through the skin just under the adipose fin and securely twisted, and then the fish was liberated. In the course of two or three years named, a large number of these trout were thus labeled. Of course the chances that any of them would be caught seemed infinitesimally small, yet in 1873 one of them reported. In June of that year, Mr. Thomas Moran, the artist, captured a fine, vigorous trout weighing 2½ lbs. Upon taking him from the landing-net the platinum tag flashed in the sunlight. Upon examination, the mark "3-71" was discovered, thus establishing the curious fact that this particular fish had gained 1½ lbs. in two years.

Of course all fish culturists know that trout under two years old grow slowly, and after that more rapidly, as is the case with the true salmon, and Mr. Page's half-pounder may be over two years old when labeled; but this is not proba-

ble. We see no reason to dispute that a Rangeley trout may not be seven inches in length at that age, while the wild trout of our small mountain streams may live to be a hundred years old, and then fall short of these dimensions. Each fish culturist must determine the question of growth from his observations on his own preserves. They may not tally with those of other breeders.

**ABOUT GRASS FOR FISH PONDS.**—A pisciculturist asks us "what kind of grass or weed would be best adapted to a pond with a gravelly bottom, situated in Vermont?" Such growth of weeds in fish ponds becomes often a necessity in pisciculture. This vegetable growth affords not only a snug nursery for the young fish, but sweetens the pond, besides attracting the flies, on which fish feed. Will some of our readers kindly give us some information on this subject, of making grass or weeds grow in the water? In carp culture vegetable growth is a *sine qua non*.

**SALMON TROUT ON THE PACIFIC COAST.**—On the Pacific coast salmon trout attain a weight of some 18 pounds. They make their appearance about November, and, after spawning, leave in March or April. As to comparisons of length as to weight, an 8-pound fish will measure about 34 inches long, a 6-pound fish some 32 inches. They never ascend very far up into the smaller creeks or rivers, and are rarely found more than 18 to 20 miles from the sea. Before their final departure for the ocean they seem to dally for quite a while in the brackish water, sometimes for a month or so. As a fish requiring skill in capturing, having no end of pluck and game in him, the California salmon trout is the sportsman's delight.

**MORE ABOUT McLEOD RIVER TROUT.**—In our last issue we called attention to the McLeod River trout. A California friend gives us the following information in regard to these fine fish. They spawn in January, and the eggs are quite as large as those of the *Salmo gairdneri*. After hatching, and before the egg sac is absorbed, they are fully 1½ inches long, quite the size of a salmon of the same age. The flesh of the McLeod trout is not as intensely pink and ruddy as that of the ordinary trout, rather of a pale cream color. As a game fish, California anglers say it has no equal.

**FISH CULTURE IN ILLINOIS.**—Two hundred thousand California salmon eggs arrived at Geneva Lake, Wis., on the 16th instant, and were placed in the fish-house of W. K. Fairbank. They will be hatched during the winter, and turned loose in the lake early in the spring. These eggs were received direct from McLeod Lake, California, packed in two large crates, with ice and moss. They were taken under the direction of Professor Baird, United States Fish Commissioner at Washington. Mr. Fairbank deserves great praise for his public spirit, as shown in his efforts to stock these waters with food fishes for the past four years. He has made liberal expenditure of time and money in furtherance of his plans, and maintained a hatching house at considerable expense. In 1875 he placed in Geneva Lake 17,000 Oswego bass; in 1876 the following fish were raised in his hatching-house and turned into the lake: 250,000 salmon trout, 112,000 white fish, 50,000 brook trout, 1,500,000 walleyed-pike, and 20,000 California salmon. In the year 1877 he added a still larger number of various kinds of fish. A grand total of 8,657,000 fish have been successfully hatched and placed in the waters of the lake. In a few years Geneva Lake will afford the finest fishing in the world. ROVER.

### SPLIT BAMBOO RODS.

To our customers and the public:—In reply to the damaging reports which have been circulated respecting the quality of our split bamboo rods, by "dealers" who are unable to compete with us at our reduced prices, we have issued a circular which we shall be pleased to mail to any address, proving the falsity of their assertions.

CONROY, BISSETT & MALLESON,  
Manufacturers, 65 Fulton Street N. Y.

**INFLUENCE OF WINE BOTTLES ON WINE.**—It has recently been discovered in France that wine may be injured through the glass of the bottles in which it is contained being to alkaline. According to analyses given by the *Revue Industrielle*, glass for wine bottles should yield per 100 parts: silica, 58.4; potash or soda, 11.7; lime, 18.6; clay and oxide of iron, 11; other ingredients, 0.3. Glass in bad bottles has been found to contain: silica, 52.4; potash or soda, 4.4; lime, 32.2; clay and iron, 11.1. The wine suffers principally from excess of lime. Thus, in glass composed of silica, 45; soda, 15; lime, 30; and clay, 15; for example, the wine became thick, and lost its aroma. The best bottle glass contains from 18 to 20 parts lime, and 59 to 60 silica; the worst, 50 to 52 silica, and 25 to 30 lime.

We take this from an English paper. Evidently Sancho Panza's uncles (who were famous wine tasters) must have been around lately.

**SHOOTING-BOX FOR SALE.**—We would call attention to an advertisement, which seems to offer singular inducements to any one desirous of acquiring a snug shooting-box in the State, where not only all kinds of game may be found, but where excellent arrangements have been made for the comforts of the sportsman. In the necessary outfit, besides horse and cow, good dogs and cocker-spaniels are offered. As we have a personal acquaintance with the gentleman who is desirous of disposing of this property, we have every reason to believe that any purchaser would be fully satisfied with the acquisition of this shooting-box.

## Woodland, Farm and Garden.

THIS DEPARTMENT IS EDITED BY W. J. DAVIDSON, SEC. N. Y. HORTICULTURAL SOCIETY.

Then came October, full of merry glee;  
For yet his noie was totty with the must,  
Which he was treading in the wine-fats see,  
And of the lousous oyle, whose gentle gust  
Made him so frolic and so full of lust:  
Upon a dreadful Scorpion he did ride,  
The same which by Diaues doom unist  
Slew great Orion; and eke by his side  
He had his ploughing-share and coulter ready tyde.

SPENCER.

### MUSHROOMS.

MANY are deterred from attempting to grow mushrooms by the idea that it is a very difficult matter, and that there is some secret about it. They have been so plentiful and cheap this fall (owing to the continued mild weather) that numbers have had an opportunity to taste the real article, with its true flavor—perhaps for the first time. The canned mushroom is all very good when nothing better is to be had, but the amateur who has a proper place to make a mushroom bed loses many a pleasant meal if he neglects their culture. Any spare shed or cellar can be used for the purpose, and perhaps the latter is most suitable, as in severe weather it can be kept at a more equable temperature—a shed in connection with a greenhouse, especially if a hot water pipe can be led round it, is better yet. The one thing necessary, however, being a temperature of 45 to 50 degrees. Let him reject all the fanciful methods of growing them as unworthy of notice, and make up a bed about four feet in width, one foot in depth, and not less than ten feet in length. This ought to be supplemented by just such another, say every three or four weeks, to give a constant succession right through the winter. Mushroom beds may be made up with all horse droppings, or what is better, part horse droppings, litter and any good soil or leaves. Indeed it does not matter much what material they are made of so long as it will heat of itself when made up, which it ought to do in about a week. When at a nice degree of warmth, it can be spawned, but if it is hot the spawning must be deferred until the heat begins to decline. It will be perfectly safe to do so when the heat of the bed is about 75 degrees, provided it is not increasing. The spawn, which can be had at any seed store, should be broken up into pieces about the size of a butternut, and dibbled into the bed about six inches apart and three inches deep. If the temperature of the bed be at 70 degrees it may be covered with an inch or so of soil at once; if 75 degrees it had better be deferred for a week. The bed must be maintained at a nice degree of moisture, but under no consideration must it be allowed to become too much so. When the materials are dry the spawn will not run, and no mushrooms will be produced; on the other hand, if kept too wet it will perish altogether. As a rule, very little moisture will be required, but when applied it should be warmer than the temperature of the house so as not to cool down the bed. After the beds have been in bearing some time, they may be watered with clear tepid manure water, made or formed only from sheep or cow manure, no soot or lime being used. It is astonishing how long a bed will keep in bearing with this treatment. When growing in clusters, as they frequently do, they must be cut off as low down as possible, the necessary care being taken to avoid injuring those remaining. The temperature of the shed or cellar should be maintained if possible between 45 and 50 degrees, and the doors and windows kept closed.

**HORTICULTURAL NOTES.**—Cut asparagus down to the surface of the ground, clean the beds well and cover with a good coating of rotted manure. A slight sprinkling of salt will be grateful, but the spade must not be used on the beds.

—Deciduous trees may now be planted at discretion. Fruit trees, roses, forest trees and ornamental shrubs may be planted at once, for the ground is still warm, and will become cooler every day. The longer therefore planting is delayed, the longer will the trees require to make the new roots, on which their vigor next season will depend. Never plant while the soil is saturated, but wait for a dry spell and then go ahead. Water plentifully to settle the soil round the roots.

—Chrysanthemums are now at their best. This has been a wonderfully fine season for them. Our fall season seems to be lengthening, so we advise all our friends to plant them, and only the best pompous varieties at that.

**THE FARM.**—The following beautiful picture is the concluding passage of the address delivered by Hon. Edward Everett, before the State Agricultural Society, in Boston, in 1837:—"As a work of art I know few things more pleasing to the eye, or more capable of affording scope and gratification to a taste for the beautiful, than a well situated, well cultivated farm. The man of refinement will hang with never wearied gaze on a landscape by Claude or Salvator; the price of a section of the most fertile land in the West would not purchase a few square feet of the canvas on which these great artists have depicted a rural scene. But nature has forms and proportions beyond the painter's skill; her divine pencil touches the landscape with living lights and shadows, never mingled on his pallet. What is there on earth which can more entirely charm the eye or gratify the taste, than a noble farm? It stands upon a southern slope, gradually rising with variegated ascent from the plain, sheltered from the north-western winds by woody heights, broken here and there with moss-covered boulders, which impart variety and strength to the outline. The native forests have been cleared from a greater part of the farm, but a suitable portion, carefully tended, re-

main in wood for economical purposes, and to give picturesque effect to the landscape. The eyes range round three-fourths of the horizon over a fertile expanse, bright with the cheerful waters of a rippling stream, a generous river, or a gleaming lake, dotted with hamlets, each with modest spire; and if the farm lies in the vicinity of the coast, a distant glimpse from the high grounds of the mysterious, everlasting sea, completes the prospect. It is situated off the high road, but near enough to the village to be easily accessible to the church, the schoolhouse, the railroad, a social neighborhood, or a traveling friend. It consists in due proportion of pasture and tillage, meadow and woodland, field and garden.

"A substantial dwelling, with everything for convenience and nothing for ambition—with the fitting appendages of stable and barn, and corn barn, and other farm buildings, not forgetting a spring house with a living fountain of water—occupies, upon a gravelly knoll, a position well chosen to command the whole estate. A few acres on the front and side of the dwelling apart, to gratify the eye with the choice forms of rural beauty, are adorned with a stately avenue, with noble, solitary trees, with graceful clumps, shady walks, a velvet lawn, a brook murmuring over a pebbly bed, here and there a grand rock, whose cool shadow at sunset streams across the field; all displaying, in the real loveliness of nature, the original of those landscapes of which art in its perfection strives to give us the counterfeited presentment. Animals of select breed, such as Paul Potter, Morland and Landseer and Rosa Bonheur never painted, roam the pastures or fill the hurdles and the stalls; the plow walks in rustic majesty across the plain and opens the genial bosom of the earth to the sun and air; nature's holy sacrament of seed time is solemnized beneath the vaulted cathedral sky; silent dews and gentle showers and kindly sunshine shed their sweet influence on the teeming soil; springing verdure clothes the plain; golden wavelets, driven by the west wind, run over the wheat field; the tall maize flaunts in her crisp leaves and nodding tassels; while we labor and while we rest, while we wake and while sleep, God's chemistry, we cannot see, goes on beneath the clouds; myriads and myriads of vital cells ferment with elemental life; germ and stalk and leaf and flower, and silk tassel, and grain and fruit, grow up from the common earth; the mowing machine and reaper—mute rivals of human industry—perform their gladsome task; the well-piled wagons bring home the ripened treasures of the year; the boy of promise fulfilled, spans the foreground of the picture, and the gracious covenant is redeemed, that while the earth remaineth, summer and winter, and heat and cold, and day and night, and seed time and harvest, shall not fail."

NOTICE TO SPORTSMEN.—Having received so many communications asking us for information in regard to our six-section bamboo trout, black bass, grise and salmon rods, we have prepared a circular on the subject, which we shall take pleasure in forwarding to any address. We keep on hand all grades, the prices of which range from \$15 to \$150. We put our stamp only on the best, in order to protect our customers and our reputation, for we are unwilling to sell a poor rod with a false enamel (made by burning and staining to imitate the genuine article) without letting our customers know just what they are getting.

P. O. Box 1,294.—[Adv.] ABBEY & IMBRIE, 38 Maiden Lane.

## The Kennel.

TO CORRESPONDENTS.—Those desiring us to prescribe for their dogs will please take note of and describe the following points in each animal:

1. Age.
2. Food and medicine given.
3. Appearance of the eye; of the coat; of the tongue and lips.
4. Any changes in the appearance of the body, as bloating, drawing in of the flanks, etc.
5. Breathing, the number of respirations per minute, and whether labored or not.
6. Condition of the bowels and secretions of the kidneys, color, etc.
7. Appetite; regular, variable, etc.
8. Temperature of the body as indicated by the bulb of the thermometer when placed between the body and the foreleg.
9. Give position of kennel and surroundings, outlook, contiguity to other buildings, and the uses of the latter. Also give any peculiarities of temperament, movements, etc., that may be noticed; signs of suffering, etc.

### CANINE THERAPEUTICS.

#### ASTRINGENTS.

ASTRINGENTS are medicines which produce contraction of living tissues; that is, a certain shrinking or condensation of structure, which, though not attended with visible movement, is nevertheless obvious in its result, as in that well known condition of the skin known as "goose-flesh," produced by exposure to cold. That astringents have this effect locally, is proved by the diminution of bulk in any part of the surface to which they may be applied, and by the strong "puckering" sensation occasioned when they are taken in the mouth. There is no doubt but they operate upon the mucous membrane of the stomach and bowels when brought directly in contact, precisely in the same manner as upon the mouth and skin. Experiment has proved that astringents are absorbed; and we draw the deduction that they are carried everywhere with the blood, thus acting by direct contact. When such contact is obtained, the organic contractility of tissues are stimulated and they shrink.

The effects upon the system are, besides the condensation of tissue just mentioned, diminished calibre of arteries, veins, capillaries, absorbents and ducts; diminished excretion, exhalation and absorption; constipation of the bowels and increased firmness, along with contraction of the pulse. The blood becomes more coagulable, probably by the same influence being exercised upon its constituents as on solids. Astringents are said also to increase the appetite and invigorate digestion. This effect they undoubtedly have in debilitated states of the function connected with relaxation of tissue. It is reasonable to suppose that, even in health, with a very moderate degree of their peculiar influence, they may produce some slight increase of the functions. Many of this class of remedies also exert a tonic influence, as with vegetable astringents, which, besides their characteristic ingredient, not infrequently contain a bitter principle also, and with preparations of iron, which are essentially and powerfully tonic, while they are in some degree astringent.

Upon a little consideration it will be seen that astringents, though stimulating organic contractility, may often prove sedative to the healthy functions, when employed freely or too long. The digestive function is impaired in consequence of the diminished secretion of the gastric juice, the restrained

peristaltic movement of the stomach and bowels, and the impeded absorption. As a result of this defective digestion, if from no other cause, the circulation is enfeebled, nutrition suffers, emaciation takes place, and a general reduction is experienced in the functions and forces of the system. When applied to delicate surfaces in great excess, instead of acting simply as astringents they become irritants. In the denuded skin they excite inflammation, and taken in the stomach cause gastric and intestinal pains, nausea, vomiting, and sometimes diarrhoea, their astringent influence being either prevented or overwhelmed by the irritation.

The indications for the use of this class of remedies are such as might be inferred from their physiological effects: First, To check morbid discharges; second, to obviate morbid relaxation; and third, to check inflammation in its earliest stage. For the first two they may be used either generally or locally; for the third they must be applied directly to the seat of the inflammation.

We will first speak of their use internally—i. e., when taken into the stomach—and it must not be forgotten that in their operation upon the mucous membrane of the alimentary canal they act as directly as upon external surfaces; the only difference being that they cannot be so freely applied to the former, in consequence of its greater sensitiveness, the greater danger of any excess of action, and the impossibility of limiting the extent of their application, or readily removing them if found to be injurious.

One of the principal uses of astringents, as administered internally, is to check morbid discharges. In fulfilling this indication they act by contracting the pores of the blood vessels through which the discharge takes place. Two distinct kinds of morbid discharges are affected by them; the one consisting in excessive or deranged secretion or exhalation, the second in hemorrhage. In reference to their influence in checking the latter, astringents are denominated styptics. In both some cautions are required in their use.

When the discharge depends upon some local or general disorder, which it is intended to relieve, as plethora, active congestion, inflammation, or the presence of noxious matters in the blood, astringents as a rule are contra-indicated; and the same applies to what have been denominated critical discharges (i. e., having reference to a crisis), though strictly speaking these belong to one of the preceding categories. As astringents operate only in a general way, by merely closing the avenues by which the fluid escapes, and have no effect in removing the disorder which the discharge is intended to relieve, it is obvious that they may, under these circumstances, do great mischief. If they check the discharge they may increase the real pathological condition; if they fail, their own irritative effect is superadded to that previously existing.

Again, an originally morbid discharge may have become habitual, and the process of digestion and sanguification having taken an increased activity, the system may have accommodated itself to the drain. Astringents in such cases might disturb this balance, and give rise to dangerous local congestion or general plethora. Therefore they are best left alone except in the hands of a physician.

Astringents are applicable when the discharge is purely local, and dependent on no co-existing disease; as, for example, in hemorrhage consequent upon an accidental rupture of a blood vessel, either from direct violence or from a sudden and temporary wound, produced by straining, position, etc. They are also applicable when the affection depends upon debility or relaxation of the coats of the blood vessels, either original or consequent upon previous excessive excitement, which has quite disappeared. This is a very common condition in the advanced stages of inflammation, and it is, perhaps, under such circumstances that this class of remedies are upon the whole most useful.

Another condition which sometimes, though rarely, calls for them, even under otherwise opposing indications, is when the discharge is so copious as itself to become the main source of danger. Thus a hemorrhage from the rectum, intended by nature as a relief to serious plethora and partial congestion, may be so frequent or abundant as to put life in jeopardy, in which case it must be arrested without hesitation. It is not unfrequently necessary to choose between such opposite indications, and the prudent man will always prefer what may seem to be the least of two evils. Again, there are certain individual remedies of this class which, with their astringent property, unite others calculated to relieve the affection in which the discharge originated, and against which, therefore, the contra-indication before mentioned has less force than against the members of the class generally. Thus, acetate of lead, while powerfully astringent, is also anti-phlogistic (i. e., tends to reduce inflammation), and may sometimes be advantageously employed to arrest morbid secretion from inflamed surfaces, when other astringents would prove very injurious.

It is unnecessary here to detail all the diseases in which astringents may be useful, and the circumstances in each which modify the indication for their employment. This will be sufficiently elucidated when we begin to describe the remedies themselves, and when we come to write of the different diseases. Guided by the above principles, and aided by the pathology of the case in hand, each will judge for himself when occasion offers. When we come to speak of diarrhoea, dysentery and hemorrhages, the indications and uses of astringents will be thoroughly explained, as applicable to these complaints, in which this class is most frequently employed, and I am sorry to say, generally with ill results to the animal.

Again, astringents are used to obviate morbid relaxation, which, in the majority of instances, is attended with morbid discharge, and the two indications are fulfilled at the same time. But occasionally there is an unhealthy laxity of the non-secreting tissues, and even the secreting may be affected in the same way without increased extravasation. In scrofulous diseases, to which the canines are equally as liable as man, and other diseases dependent upon defective or depraved nutrition, this condition is not uncommon, and astringents are often and advantageously used in their treatment. In the convalescence from febrile and other acute diseases, especially when somewhat protracted, the same condition not unfrequently exists, calling for the same remedies. It is probable that many of the tonics which are so valuable under such circumstances owe as much of their virtues to their astringent as their tonic properties, as the salts of iron, for instance. In chronic inflammation of the mucous membrane of the stomach or bowels, when all acuteness is passed, and the blood vessels are merely passively distended, or ulceration exist, which, in consequence of the laxity and feebleness of the tissue, are unable to take on the healing process, there would appear to be an indication for astringency, and the fact is, some of the most efficient remedies in such affections belong to this class, as sulphate of iron.

TO CHECK INFLAMMATION.—The indication for this class of remedies in the early stage of inflammation, founded on their

property of contracting the vessels, and thus excluding in some measure the blood necessary for the support of the inflammatory process, can seldom be fulfilled by their internal use. To answer this purpose they must be brought to act upon the inflamed vessels in a more concentrated state than would be safe, or indeed possible, in the blood, through the medium of absorption, and they would consequently be wholly inapplicable to any inflammatory affection, the seat of which could be reached only through the circulation. Even in inflammations of the alimentary canal, there would be too much risk, that, if used largely enough to have any powerful effect, they might act more disadvantageously as irritants to the sound parts than usefully as astringents upon the inflamed, as it would be impossible to limit their application to the latter and, besides, there is always difficulty in deciding whether the inflammation has not passed the point at which any good could be expected from them. Hence, astringents can seldom be used internally, with the view of rendering commencing inflammation abortive, and it is only externally or topically, that, as a general rule, they can be beneficially applied upon this principle.

For the external use of astringents the same indications exist as for the internal, and they are even more effectual by the former method than the latter.

For arresting morbid discharges they are employed in excessive secretion, resulting from advanced or chronic inflammation or debility of the vessels, in the nostrils, conjunctiva, external ear, mouth and fauces, urethra and bladder, vagina, and rectum. Hence their use in chronic *coryza*, and *catarrh*, *ophthalmia*, *otorrhoea*, *cystorrhoea*, and mucous or purulent rectal discharges. They are the most effective remedies in hemorrhage from all these sources. The same caution should be observed as in their internal use; not too hastily arrest a discharge which is effecting some useful purpose. But they may sometimes be employed with propriety topically, where we might hesitate to administer them by the mouth, and almost always with greater freedom. Any irritation they may excite in external parts is much less hazardous than an equal amount in the stomach or bowels. Besides, we can in this topical method exactly limit their application, if deemed advisable, and should they act too powerfully, may remove them. They may, moreover, be used much more effectually than by the stomach, because in a more concentrated state.

For obviating relaxation not essentially connected with excessive discharge, they are employed in a great variety of affections, as in prolapsed anus, uterus, etc.; in indolent, flabby and fungous ulcers, and in various other conditions of local debility, attending or following advanced and chronic inflammation of the different surfaces mentioned in the preceding paragraph.

In the form or early stages of inflammation, with the view of contracting the capillaries, astringents are often and most usefully employed. When, however, that process is in full vigor, and sustained by a plethoric state of the blood, or some cause acting strongly through the constitution; when, too, exudation has taken place in the tissue, and blood may have coagulated in some of the vessels, astringents will often fail to produce their characteristic effect, and may even increase the inflammation by acting as irritants. But even under such circumstances, after the activity of the inflammation has been subdued, they may again be resorted to, and will now more frequently succeed where they had before failed. Hence this class is used locally in inflammation of the conjunctiva of the mouth and fauces, of the rectum of the mucous membrane of the genito-urinary passages, and of the skin. It is upon this principle, in part, that they operate so usefully in various cutaneous eruptions. But in the choice of astringents for these purposes there is great occasion for the exercise of judgment. From their diversified powers, some are applicable where others might prove injurious. It is obvious that those which possess other anti-phlogistic powers besides astringency must be more efficient in answering the indication than pure astringent. Hence the minerals are generally more efficacious than the vegetable substances belonging to this class.

I should, perhaps, before have mentioned that astringents are of two classes: those derived from the vegetable kingdom and those from the mineral. The former are distinguished by a striking similarity of properties, which has been ascribed to depend upon a peculiar proximate principle known as *tannin* or *tannic acid*. Though this, as found in different products, differs somewhat in chemical character, yet both in this respect and its sensible therapeutic properties, it is nearly identical that in relation to its many uses it may be considered as one substance. Tannic acid seems to be purely astringent and destitute of other physiological property. The vegetables, therefore, which contain little or none of any other active principle than this may be looked upon as proper representatives of the class. But these are very few. Most of the vegetable astringents also contain a bitter principle, which somewhat modifies the influence of their tannic acid, and might entitle them to rank with the tonics, which they markedly resemble in their effects. But so far as their astringency is concerned, they are essentially different from that class of medicines, resembling them only in this single point, that in cases of debility connected with deficient cohesion of the tissues, they increase strength by restoring to the tissues the compactness necessary for the proper exercise of their functions. It is obvious that the bitter astringents are less applicable than tannic acid itself, or the pure astringents, to those cases in which it is desirable to stimulate, whether locally or generally, as little as possible.

The mineral astringents have in general nothing in common but their astringency. Each has peculiar properties of its own, which render it applicable to peculiar purposes. Thus the preparations of lead are sedative; alum has an alterative influence; sulphuric acid is refrigerant and tonic, and the preparations of iron have remarkable tonic properties, and a peculiar power of modifying the blood. Between the sulphates of zinc and copper (*oxyd*, white and blue vitriol), however, there is a remarkable coincidence of properties, though the latter is vastly more powerful than the former.

LYNNBURG DOG SHOW.—At the Dog show held in connection with the Lynnburg Fair, Oct. 24th, the prizes were awarded:

For the best imported dog or bitch, first premium of \$50 or a silver cup of equal value, awarded to Dr. W. A. Strother, Frost. Second premium to T. S. Warren's bitch Lou. For native-born setters, Gen. Wm. R. Terry's dog Sport received the first premium of \$30, and G. T. Johnson's dog Fleet, received the second premium of \$20. For the best puppy under twelve months, H. B. Powell's Queen Bess received the premium of \$10.

—The time of closing entries in the Nashville Field Trials has been extended from November 1, to the 10th.

**GILBERT.**—This fine Irish setter, which, in another column advertised for sale, is a very desirable purchase; he is well broken and a good hunter.

**A NEW BREED OF DOG.**—An actual incident at the Boston Dog Show.—Enter inquisitive old man and wife, near stable containing a pup staghound, in process of retrieving from young Irish attendant his morning's meal.

Old man—"What kind of a dog is this, my friend?"  
Young Irish attendant—"Sitting Graveyard, No. 2, yer Honor."  
Old gent repeats information to wife, and passes on.

SAWBONES.

**PHILADELPHIA DOG SHOW.**—There is to be a bench show of dogs in Horticultural Hall, Philadelphia, the last week of November. Between \$1,200 and \$1,500 are to be distributed in prizes. The Adams Express Company will transport dogs at one-half their usual rates. All information may be obtained by addressing the committee at Horticultural Hall.

## Sea and River Fishing.

### FISH IN SEASON IN NOVEMBER.

Black Bass, *Micropterus salmoides*; Weakfish, *Cynoscion regalis*, *M. nigricans*, *Esox nubilus*, *Hice or Pickerel*, *Esox lucius*, Yellow Perch, *Perca flavescens*, *Perca bass*, *Sciaenops ocellatus*, *White Bass*, *Morone chirocentrus*, *White Perch*, *Morone americana*, Bluefish, *Pomatomus saltatrix*, Spanish Mackerel, *Scomber maculatus*, *Cero*, *Cybinus regale*, *Bonito*, *Sarda pelamys*, *Kingfish*, *Menticirrhus nebulosus*.

**FISH IN MARKET.**—The supply still scarce, owing, as much as anything else, to the bad weather. Bluefish, as is their wont, have turned to the South and are now being caught off Cape May. Bass, according to size, 15 to 18 cents; bluefish, 10 to 12 cents; salmon, frozen, 30 cents; mackerel, 15 cents; weakfish, 15 cents; white perch, 15 cents; Spanish mackerel, 30 cents; halibut, 18 cents; kingfish, 30 cents; codfish (source of supply, Black Island), 8 to 10 cents; blackfish, 15 cents; flounders, 6 to 10 cents; lobsters, 10 cents; sheephead, 25 cents; scallops, \$1.25 per gallon; soft clams, 30 cents per 100; large do, 60 cents; whitefish, 18 cents; salmon trout, 15 cents; hard crabs, \$3.00 per hundred.

The fishing for striped bass in the vicinity of New York is remarkably good, and much sport is afforded.

**MOVEMENTS OF THE FISHING FLEET.**—The shore mackerel fleet, continue in the neighborhood of Cape Cod, meeting with indifferent success, and it becomes more and more apparent that the mackerel stock for 1877 will be the smallest. The Bank fleet continue to make short trips, and bring in light tines. 12 have been reported the past week. The market has been fairly supplied with fresh halibut, but the receipts of Bank codfish have not been large. We notice receipts of 145,000 lbs. halibut and 365,000 lbs. Bank codfish. The Georges season is drawing to a close. 20 arrivals have been reported since our last issue, with 160,000 lbs. codfish and 6,000 lbs. halibut. The stock on the market is small, the call fair, and prices well sustained. Total number of fishing arrivals for the week, 48. —Cape Ann Advertiser, Oct. 26.

**RHODE ISLAND—Providence.**—A favorite resort for gunners is Westquogue Pond. The pond is separated from Providence River only by a long, high sand hill, which, with the hill and woods opposite, completely enclose it. Here are found stone snipe, meadow larks, plover and a host of other game birds. Beyond the pond are the cliffs, extending for nearly half a mile toward the ferry, and then falling into low, broken ridges. Below these cliffs is the favorite fishing of the neighborhood. Bass, tautog, mackerel, and in fact nearly all fish common to New England waters are here found in profusion. F. H. S.

**NEW YORK—New York.**—The season for bass this year has been an unusually long one. The piers along the North and East rivers are daily crowded with fishers old and fishers young, fishers rich and fishers poor.

**A BIG PIKE.**—We saw in Mr. Bell's atelier, on Broadway, a pike which has been prepared for the State Museum at Albany. The specimen was forty-five inches in length, weighed nineteen pounds, and was caught in Warren county by a sixteen-years old boy.

**PENNSYLVANIA—Conecago, Oct. 27.**—Bass fishing at the falls is the thing just now.

**CALIFORNIA.**—The State Fish Commissioners, from close investigation, have ascertained that the legal catch of salmon for the past three years, counting the fish caught at points in the bay below Benicia, and shipped to San Francisco or Sacramento, was, from November, 1874, to the first of August, 1875, 5,098,781 pounds; from November, 1875, to August 1, 1876, 5,511,423; from November, 1876, to August 1, 1877, 5,493,563. This shows an increase of about a million and a quarter pounds for this season, and is an indication that the fish were plentiful. —Pacific Life.

### SALMON FISHING.

MEMORANDA OF A FORTNIGHT'S SOJOURN ON A SALMON RIVER.

ALBANY, October, 1877.

FOREST AND STREAM:

Last year the river was so high that it was the 20th of June before we could take a fish. This year the water was in splendid flowing condition on the 15th of May. But as we deemed the 16th of June early enough to be on the ground, we lost the supreme sport which always accompanies the first run. We regretted the delay when it was too late, and made the best of our blunder. From the grand sport we had you can infer what we might have had if we had been on hand in time.

June 11.—Began fishing at 7 A. M. and hooked a fish at the second cast. Everything was favorable, and he was brought to gaff in thirty minutes. He weighed exactly thirty pounds. In five minutes I was giving my second. He was a very lively customer—showing himself a full length six times in as many minutes, and no wonder, for, when after an hour's hard fight, I landed him, I discovered that he had been soaked foul. He weighed twenty-eight and a half pounds. My third,

taken as soon as I could cast for him, weighed twenty-six pounds. This was my morning's work with nearly as good sport in the afternoon.

June 12.—Hooked and fought a large fish for an hour, when he ran into the rapids below the pool and broke off. Next morning he was caught in a net (the Warden's) at the mouth of the river nine miles below. He weighed forty-four pounds. I had him within reach of my gaffer several times, but he seemed to be afraid to strike. I would rather have lost half a dozen thirty pounders, for he was the largest fish hooked in the river this season. Although I afterward fished faithfully I fished in vain. The water was so low and transparent in the pool I held that the fish were too shy to be lured. On returning to camp I recounted my fight and failure, and my companion consoled me thus: "Fish oft are hooked and yet escape without; But better hook and lose than never hook at all."

June 13.—A fine morning and excellent sport. In one hour and thirty minutes I landed three fish. The first weighed twenty-five pounds, the second twenty-six pounds and the third twenty-six pounds. Before 10 o'clock I killed two others—twenty-eight pounds and thirty-six pounds. All these fish rose head and shoulders out of water when they took the fly. I lost one fish—small, not over twelve pounds, but he was the liveliest fellow I ever struck. I could do nothing with him his movements were so eccentric and impetuous.

June 14.—A furious gale rendered casting impracticable. I succeeded, however, in killing two fish by a sort of half troll—ten pounds and twenty-nine pounds. I lost one because I was unwilling to disturb the pool by following him through it. My poetic friend rebuked me for my excessive caution, thus:

"To slight a hooked fish you should never oughter;  
One fish in the boat is worth ten in the water."

June 15.—A lovely day—clear and balmy. Killed three fish weighing respectively, twenty-five pounds, thirty and a half pounds and twenty-six pounds. Missed four handsome rises unaccountably, and lost one by the hook breaking after a long fight. I never had such a succession of mishaps; but you know "misfortunes never come singly but by battalions." My poet friend comforted me with this couplet:

"While ill luck always makes the foolish rare,  
Wise men are patient even when they fail."

June 17.—Had unusually fine play in the forenoon with a large fish. He kept me busy two hours before he was brought to gaff. He weighed thirty-three pounds. The others of twenty-one and twenty-seven pounds gave me a surfeit for the day.

June 18.—I had a provoking experience this morning. I struck a fish in swift water and after weighing anchor my canoe men made for the still water on the opposite side of the river—a distance of more than 200 feet. But the fish remained just where I struck him. This left 250 feet of my line to be "sagged" by the current. The result I feared followed. When the fish jumped, as he did repeatedly, the tension of the line was so great that he broke off; for "dipping the tip" under such circumstances is of no account. The strain caused by the current is beyond your control. When I found that I could not draw the brute out of the swift water I ordered my canoe men to go back. But it was too late. I lost my fish. Men.—Always under such circumstances keep as near your fish as you can. A long line "sagged" by the current is a difficult thing to handle. I afterward killed four fish, eleven and a half, fifteen thirty-five and fourteen pounds. The latter was a slink—which, you know, is a salmon-angler's abomination—which induced the question "When may an angler swear?" Our poet responded:

"When may an angler swear? Well, let me think;  
Why, when a salmon proves to be a slink."

June 19.—The fish are running very large. The three I took to-day weighed twenty-five, thirty-two and thirty-four pounds. No sport in the world is equal to the rise, strike and capture of these monster fish in swift water.

June 20.—A very bright day, and the water as transparent as the atmosphere, and very low. I have had at least a dozen "false motions" from as many fish to-day; that is, they would start for the fly with a rush, and then, just before reaching it, stop as if shot and glide off as if conscious of danger. I could reach but one conclusion; the water was so clear they could see the canoe, the anglers, the rod and even the tiny line and leader, and were scared. Jock, the poacher whom Macdonald immortalized in his "Starling" knew what he was talking about when he said that salmon water was in its best trim when it had "a wee drop porter in't"; that is, when it was rendered a trifle brown by recent showers. A single fish of twenty-three pounds was all I could lure to my fly, although my casts were never short of eighty feet. My friend was even more unfortunate than myself, and thus recounted his bad luck:

"Pity the sorrows of a longing tramp  
Whose bark canoe has borne him to your camp;  
For six long hours he's cast without a rise,  
And now seeks comfort from your camp supplies."

June 22.—To-day fish were everywhere lazily lying under the lee of a rock, slowly sailing about in the transparent pools, or leaping in sheer friskiness in their leisurely march toward the upper waters. Here, for instance, in the pool where I have been casting, eight or ten fish have been jumping all day. But nothing could lure them to the fly. After casting steadily for several hours I finally rose a fellow who had not been leaping and killed him. He weighed twenty-six pounds. In view of this propensity of salmon not to take the fly when in this leaping mood our poet recorded the following:

"When you can win at cards without a trump  
You may take salmon when they're on the jump.  
Mong the huge humbugs on this earthly ball  
A leaping salmon is the king of all."

June 23.—A phenomenon. My camp companion while casting with a full sized "silver doctor" rose and struck a young salmon which weighed just half an ounce. He was a perfect beauty and rose to the fly like a little man. Although we fished faithfully all day this was the extent of our epoch, whereat my friend thus philosophized:

"Weary and sad the angler seeks his lair,  
When glowing hope is changed to blank despair."

And this also:

"As well make dinner from an empty dish  
As fish for salmon where there are no fish."

June 25.—A cloudy day and a fair catch. The fish are getting very shy. If the water had been in good condition I would have trebled my take, for the pools are full of fish. As it was I took but three—nineteen, twenty-one and twenty-four pounds.

June 26.—Three days of very indifferent success; one day without either a rise or strike. But we were at no time without good sport, for the sea trout were large and abundant, and we took them weighing from one to six pounds every day. For eating, as a steady diet, we preferred them to salmon. But trout was not what we came for, so, as our poet said:

"To cast all day and never hook a fish  
Is supping chalice from a golden dish."

So we concluded, like the Arabs,

"To strike our tents and sadly steal away  
Hoping to live to fish some other day."

My score showed that my first fourteen fish averaged twenty-eight and a half pounds. At the close my average was twenty-six and a quar-

ter. This is the largest average I ever made. But for three of ten, thirteen and twelve my whole average would have approached thirty pounds. My last year's average was twenty-five pounds.

Three of party who went up to head waters had excellent sport. Their score was sixty-two, forty-five and thirty-eight fish in ten days.

This year's experience has confirmed me in my opinion that the very best time to fish is the moment the spring freshets have so far subsided as to enable you to reach the pools. I hope next year to be on my favorite river at just this best time. It will be weary waiting, but the interval will be filled with the pleasure of anticipation. G. D. Albany, Oct., 1877.

**FISH ABOUT NORFOLK, VIRGINIA.**—We are indebted to Mr. W. H. Seabury for the following valuable catalogue of the fishes found in the vicinity of Norfolk, Va.:

#### EDIBLE SALT WATER FISH.

Rock (Striped Bass)—Remain nearly the entire year; bait, crab or shrimp. Gray Trout (Squeteague)—In season April to November; bold biters. Salmon Trout—Spots more distinctly marked than in gray; similar habits. Roundheads (Kingfish)—May to November. Saltwater Chubb (Black Fish or Tautog)—Very seldom found here over five pounds. Sheephead—Abundant at mouth of James, York and Back River. Porgy—Very similar in appearance to sheephead. Spot—Small delicate pan fish; in their prime in September. Hogfish—The highest priced fish for the table. Sunfish (Pompano)—Not very abundant. Travallaier—Small pan fish; lives by suction. Red Drum—Caught mostly on sea and bay shore. Black Drum—Caught mostly on sea and bay shore. Croaker—Always on hand during the fishing season; fair pan fish. Maiden (Scup)—Very small and not abundant. Menhaden, (Mossbunker or Fat Backs)—Norfolk harbor packed with small fry. Black Will—A dark, perch-shaped fish, seldom over one and a half pounds; caught near fresh-water creeks; not very abundant; bite occasionally. Bluefish—April, May, November; caught altogether in seines. Tailin—Small variety of above stay from April to December. Bonito—Large fish from two to five and a half feet; mostly taken with a gig. Shad—In prime order generally in March. Herring—Abundant. Hickory Shad—Abundant in spring and fall; no very large ones. Flounder—Earliest salt-water fish in market. Mullet Jumping—Caught mostly at night by hanging a light at the bow of the boat which they jump at. Mullet Sea—Sharp bodied biter. Mackerel Spanish—Do not take bait; caught on bay shore. Mackerel Bay—A darker, heavier body than the Spanish. Jewish or Tarpon—An occasional summer straggler.

#### VARIEFISH NOT USED FOR FOOD.

Alewife (Menhaden, Mossbunker or Fat Backs)—The harbor packed with small fry. Salt Water Catfish—Caught near fresh-water creeks. Flying Fish—Not very abundant; bite occasionally. Gar—No very large ones. Sting Ray—Numerous and troublesome. Dogfish—Abundant. Skate—Not numerous. Shark—A few large ones occasionally. Porpoise—Abundant. Eels—Very abundant and large. Pipe Fish—A very slim round fish. Poofish—Have a receding head; often strand themselves on the shore, hence the name. Hippocampus or Horsehead—Occasionally seen. In addition to these varieties, the seines often bring up rare kinds for which the fishermen can give no name.

#### FRESH WATER FISH.

Blue-mouthed Perch, Brown Perch, Red Fir Perch, Raccoon Perch, Pike, Pickerel, Robin, Grindle, Catfish, Mud-sucker, Sturgeon, Perch White, Chub, Eels—These are brought mainly from Currituck Sound and the little streams flowing in, still a good many are brought from the small ponds in Princess Anne and Norfolk counties. Fresh water fishing is not much of an amusement here. W. H. SEABURY.

**COOKING FISH.**—The editor of the Rochester Express has been keeping batchelor's hall evidently, and gives the following excellent result of his experience:

Fish should be washed as little as possible, and white fish, after being cleaned and wiped with a damp cloth, should have the stomach stuffed with salt for an hour or two before cooking. Fish should be put on in cold water, so that the inner part may be sufficiently done and also, it is less liable to break. This rule holds good, except for very small fish, or for salmon boiled in slices, when boiling water should be used. The time will depend on the kind and size of fish, but it may be easily known it is ready by drawing up the fish-plate and trying if it will separate from the bone. Here, as in other things, practice is better than all the directions that can be given, as so much depends on the strength of the fire and the size of the fish. A little salt and vinegar should be always put into the water, and some prefer their fish boiled in what is called a "court bouillon," and this is how it is done: Lay the fish in the fish-kettle with enough cold water to cover it, add a glass of wine or vinegar, sliced carrot and onions, pepper, salt and laurel leaf, a bunch of parsley, a faggot of sweet herbs or some of the same powdered and tied up in a muslin bag. These seasonings impart a fine flavor to most boiled fish, excepting salmon, and for fresh water fish it is considered very useful for getting rid of the muddy taste they often have.

**PERSIAN FISHERIES.**—A recent report by Consul Churchill on the trade and commerce of the province of Ghiler and Asterabad contains some interesting information with regard to the fisheries on the southern coast of the Caspian. From these fisheries vast quantities of caviar, isinglass and dried fish are exported every year to Russia and the Caucasus. The sturgeon (called the seg mahi or dogfish), the salmon and salmon trout (called azad mi and sefid mahi) abound in the creeks and rivers along the coast of Ghilan and Mazenderan. The former, the most valuable of the three, produces the much-prized caviar, of which so large a consumption is made in Russia and in Turkey; while the sefid mahi, when dried, supplies the poorer classes of the provinces, as well as those of Shirvan, in salt fish at a very low price all the year round—a luxury which to them is very palatable with their rice, which constitutes their principal food. Within the last two or three years the fisheries of Ghilan and Mazenderan have been farmed out to a Russian subject named Leonzoff, who has agreed to pay to the Persian government the sum of 41,000 toman a year for the monopoly. This contract is for five years, and, although the amount thus paid exceeds the amount formerly collected by the government for the said fisheries, it is calculated that a much larger sum might have been paid for the said fisheries, viewing the profits made by Leonzoff. When the winter season sets in, and the fish seek shelter in the creeks and up the rivers to spawn, upward of five hundred fishermen are employed. It frequently occurs that the fish are so plentiful—coming as they do in shoals—that they are bailed out of the water at the mouth of the creeks and rivers. Under such circumstances, as many as 30,000 fish are caught in a day. At other times prongs and hooks and nets are used. The sturgeon—which is deemed "haram" or unlawful for food by the Persians—is cut open for the purpose of extracting the roe and the gelatinous substance on the back. It is then salted and put into casks as is also the caviar, and shipped for Astrakan (the headquarters of

(Leonozoff's business). There the caviar is put into tins and sent to all parts of Russia. It is calculated that the produce of these fisheries exceeds 200,000 tomans a year. No export duty is levied on this produce, and the Persian government have no control over this gentleman's establishment. It is, therefore, difficult to say what amount of profit is made; but the expense of catching, salting, packing and shipping cannot come to much less than 100,000 tomans a year. Salmon and salmon trout weighing fifteen pounds to twenty pounds or more can be bought in the season for from 2s. to 4s. The flavor of the former is more like the salmon trout than the real salmon. Its color is of a paler hue, and it can surely be recognized as salmon by its taste. The sard mahi does not exceed five pound or six pound in weight, and is sold fresh at 4d each.

—*Land and Water* tells about the biggest salmon killed by a fly. It is to be credited to Mr. John Haggart, of Stanley Waters, who landed one of sixty-one pounds.

—It is rather difficult to place a new English sport, and to decide whether it be gunning or fishing. Mr. Buckland proposes to go after Finer whales, only seventy feet long, which may be found rollicking off the Scotch coast. "It can be easily accomplished," writes Mr. Buckland, "with the aid of a steam yacht and a harpoon gun." This must be pot hunting of the very best character, and quite profitable when one learns that whalebone is worth, say, \$4,000 a ton, and sperm oil is equally high priced. If bagging a whale does not offer sufficient excitement, Mr. Buckland proposes that porpoise killing be made fashionable, as the Fishery Board offers a bonus for their destruction.

## Game Bag and Gun.

### GAME IN SEASON IN NOVEMBER.

|   |  |
|---|--|
| Moos Alcege, machilis.                    | Red Deer, <i>Caracus virginianus</i> .             |
| Bik or wapiti, <i>Cervus canadensis</i> . | Squirrels, red, black and gray.                    |
| Hares, brown and gray.                    | Quail, <i>Oxyptus virginianus</i> .                |
| Wild turkey, <i>Meleagris gallopavo</i> . | Pinnated Grouse, <i>Coccyzus Cupidonia</i> .       |
| Woodcock, <i>Phalaropus minor</i> .       | Curlew, <i>Numenius arquaria</i> .                 |
| Ruffed grouse, <i>Bonasa umbellus</i> .   | Sandpipers, <i>Tringinae</i> .                     |
| Plover, <i>Charadrius</i> .               | Willetts.  |
| Godwit.                                   | Reed or Rice Birds, <i>Dolichonyx orizivorus</i> . |
| Tit, <i>Tallus virginianus</i> .          | Wild Duck.   |
| Sulphur and Bay Birds.                    |  |
| Caribou, <i>Tarandus rangifer</i> .       |  |

"Bay birds" generally, including various species of plover, sandpiper, snipe, curlew, oyster-catcher, surf birds, phalaropes, avocets, etc., coming under the group *Limacole* or Shore Birds.

—The frequent alteration of game laws makes such confusion that sportsmen are kept quite in the dark as to when shooting on various kinds of game is permitted. We therefore append the following table for reference:

| States     | Pinnated Grouse. | Ruffed Grouse  | Quail.         | Woodcock.        |
|------------|------------------|----------------|----------------|------------------|
| Ill. ....  | Sep 1 to Jan 15  | Oct 1 to Feb 1 | Nov 1 to Feb 1 | Sep 1 to Jan 15  |
| Ind. ....  | Oct 1 to Feb 1   | Nov 1 to Jan 1 | Nov 1 to Jan 1 | July 1 to Jan 1  |
| Wis. ....  | Aug 1 to Dec 1   | Sep 1 to Dec 1 | Oct 1 to Jan 1 | July 1 to Jan 1  |
| Mich. .... | Aug 1 to Oct 1   | Sep 1 to Dec 1 | Sep 1 to Dec 1 | July 3 to Nov 1  |
| Wis. ....  | Aug 1 to Nov 1   | Sep 1 to Jan 1 | Sep 1 to Jan 1 | July 4 to Nov 15 |
| Neb. ....  | No Shooting.     | No Shooting.   | No Shooting.   | No Restrictions. |
| Kans. .... | Aug 1 to Feb 1   | Oct 1 to Jan 1 | Oct 1 to Jan 1 |                  |

MAINE—*Kingfield*.—About twenty-five bears have been killed in Kingfield within a few weeks, making fifty killed the past season.

VERMONT—*Ferrisburgh*, Oct. 26.—Wild geese are flying south. Ducks plenty in the lake, but very wild. Ruffed grouse quite numerous. Fox hunting at its height. Saw the last woodcock of the season yesterday. VERO MONT.

MASSACHUSETTS—*Chatham*, Oct. 24.—Picked up a few blackbreasts and yellow legs, and some surf snipe, frost birds, etc., every day the past two weeks. On the mainland, just across from Nauset beach, a man came across a passing flock of winter, about 200 in number, and secured fourteen with the first barrel on the ground, and three more when they rose. Saw only two redbreasts during my stay, and there have been none since the 1st of Sept. Gunners here say that the young birds, which always come last, must come, but as it is so late we fear that they may go along the first cold storm without stopping on our coast. Coots are very plenty outside, and black ducks were passing over in small bunches Friday and Saturday last. Reports from Monomoy grounds for same period indicate a corresponding state of affairs. The outlook for further shooting on bay birds here is good. You cannot give away chilled shell here; the gunners cite instances of plover flying a number of hundred yards after being struck by three or four shot (corresponding to Tatham's No. 8), the pellets often going right through, and making too clean a wound to stop them within bounds. There are more winters in Boston markets to-day than for six weeks previous, and are in first-rate condition. Ruffed grouse are a drug, and the poor snarers have hard work to get rid of them. PLUVIER.

Salem, Oct. 20.—Quail very plenty here this fall, but appear to be moving south; saw first teal on 6th; bagged two of them. Saw two snipe and two teal on 19th; bagged them all; saw first geese this evening, about thirty of them moving south-east very high. J. B.

Salem, Oct. 29.—Since last, have been out some with the gun at West Newbury, Newburyport and Hamilton on Miles River. Have found some snipe, though not at all plenty. Got 3 rail live from West Newbury; this is late for these birds. The grounds all through our county have been in better order for fall snipe shooting this season than for some years. A party of three at Plum Island last Tuesday morning shot 58 grass birds. Coots have been numerous in Ipswich Bay, and some good marsh bird shooting has been reported from Rowley. Woodcock are scarce; some partridges around. I have an albino taken at Hamilton lately. I have it pretty straight that one Wm. Dane, of Hamilton, with three Beverly gunners, have been shooting quail in a shameful manner. Yours, TEAL.

NEW YORK—*Elfred*, Oct. 19.—A number of sportsmen who have been stopping at the house of Mr. J. M. Bradley, Elfred, Sullivan Co., report good fare and excellent sport.

Auburn, Oct. 27.—Partridges are plenty in the vicinity. One man bagged thirty-six the other day.

Cayuga, Oct. 29.—Wild geese have been flocking about the lake the past few days.

Franklin, Oct. 29.—Ruffed grouse are more plenty than usual in this section. I keep the cockers busy on good days, and my friends busy devouring grouse pot-pie. Woodcock scarce. M. P. McK.

Bloomington, Oct. 29.—Woodcock shooting is good in this part of the county. Last Tuesday bagged 20 woodcock, 4 partridges; on Wednesday, 14 woodcock and 2 partridges; on Thursday, 12 woodcock and 4 partridges. This is the way the shooting holds. Any one wanting some good shooting can find some here. MILO SEAGRAH.

Syracuse, Oct. 26.—A party of sportsmen are preparing for a week's duck hunting on Oneida Lake. They are to be the guests of Capt. Nichols in his steam yacht, Spillifer.

NEW JERSEY—*Red Bank*, Oct. 24.—Quail crop fair throughout the county. WILD.

MARYLAND—*Hyatt de Grace*, Oct. 24.—A correspondent writes: "Too calm for marsh duck shooting. Ducks plenty on the flats. Quail crop short in Harford Co. I had four days' snipe shooting of the finest kind on Speciosa Island. I thank Mr. Hyde for his permission, which I did not get until after I left, for the good time among the jacks. I will not tell you how many I killed, but I wasted over one hundred and fifty shells, and did not miss but every other time. Now you know."

BALTIMORE, October 27.

#### EDITOR FOREST AND STREAM:

The ducks have been very backward in making their appearance in our waters this fall, but the shooting is fairly opened now.

We hear of good bags having been made at Carroll's Island, Grace's Quarter, Maxwell's and at some of the points on Back River.

On last Friday a friend and myself killed at Legoes Point, located at the mouth of Bush River, forty-eight ducks, all red heads but eight. Most of these ducks had just arrived, as their craws were filled with small shell-fish and seeds of different kinds—some of the latter of which I send you, and would like to know what variety of plant they come from, as I have never seen anything of the kind during an experience of thirty years' duck shooting.

They are now busy on their favorite food, the Valisneria grass, and in eight or ten days will be in prime condition.

Ducks are said to be more plentiful on the flats at Hyatt de Grace this season than for many years before. Snipe boat shooting begins the next week, which will stir the ducks up and thereby make better shooting at the points on the various rivers.

Respectfully yours, Wm. H. KEENE, M. D.

[Ans.—We have made diligent inquiries of seedsmen and florists, Botanical drug stores, and the Botanical Garden, without satisfaction. The specimen you enclose may be the seed of the ramie, a species of flax cultivated in the northwest; but this is not probable, as the breeding-places of the red head are in subarctic regions—though it is believed that some breed in the Rocky Mountains. More likely, and we feel quite positive in our opinion, the seed is of a species of grass which we have ourselves seen along the Labrador Coast, but we cannot give the botanical name.—Ed.]

PENNSYLVANIA—*Sharon*, Oct. 26.—The best bag that has been made here for several years was made by Frank Davis on the 22d—eleven ruffed grouse. ROS.

Hornellsville, Oct. 29.—There has been some fair shooting since my last. Eugene Kennedy, 11 woodcock; Burt Elliott and Dan Gardner each 10. Dan Gardner one day at Silver Lake, 9 ducks; Arnett and Tenney at Loon Lake shot 2 fine loons and a duck never before seen about here—white head and breast, black back and two very long slim feathers for a tail. Some say it is an Old Squaw; I say it is more big injun. JOHN.

Uniontown, Oct. 25.—A party of sportsmen, consisting of Thomas H. Lewis, John Bicer and E. B. Wood, had remarkably good luck the other day, capturing a number of woodcock, quail, pheasants, etc.

Harrisburgh, Oct. 26.—Wild turkeys are abundant in the valleys which skirt the base of Roberts', Kittatanny and Peters' Mountain, north of the city. Quail and pheasants are in unusual numbers, especially in the valley east of the Susquehanna.

Sunbury, Oct. 26.—Quail afford good sport. Several gunners have made fair bags.

VIRGINIA—*Norfolk*, Oct. 26.—There are few red foxes in Norfolk county, but the gray ones are nearly as numerous as rabbits. This is the season for the hunt, and, with the excellent runs here, there is the best of opportunity for sport.

KENTUCKY—*Stanford*, Oct. 24.—Out shooting yesterday. Quails superabundant, but a majority of coveys not more than half-grown. Weather too dry for dogs to work well. Bagged 37. KENTUCKIAN.

NORTH CAROLINA—*Charleston, S. C.*, Oct. 24.—A correspondent in the neighborhood of Charleston, S. C., informs us that foxes are plenty, and that capital sport can be had. On four occasions a fox hunt was in order, and each time Reynard was bagged. Deer are also reported in fair numbers, and much sport is anticipated.

GEORGIA—*Americus*, Oct. 25.—Partridges or quail are very abundant in this county. ALBERT L. REES.

FLORIDA.—Owing to the enforcement of the game laws, all kinds of game this season promises to be more than usually abundant.

Enterprise, Oct. 26.—Deer, wild turkeys, snipe, quail, etc., are to be found in great numbers.

TEXAS—*Galveston*, Oct. 2.—Ducks are plenty, judging from the quantity in the markets; but have to go some distance for shooting, as it is really dangerous to hunt near town on account of the crowd that sallies out to shoot indiscriminately. C. G. P.

OHIO—*New England*, Oct. 26.—Never within my recollection were quail so plenty in southern Ohio. A favorable winter followed by a most excellent hatching season accounts for it. My father owns a little farm of less than 100 acres on which there are not less than nine becks, some of them containing two hatchings. G. P. J.

ILLINOIS—*Warsaw*, Oct. 20.—The region of Lima Lake, some ten miles south of this city, has for many years past been a famous hunting and fishing resort. The location is a part of a vast bottom subject to annual overflow, and possesses dense

forests and numerous long and deep sloughs teeming in fall. During the Fall months camps are established by sportsmen from Keokuk, Peoria, Quincy and other cities and towns. Lesser note, in company with a couple of friends equipped with rods and guns I made a recent trip. We found but few woodcocks, these fox squirrels, a few snipe, two becks of quail and a few prairie chickens. The small birds were migratory and in places the forest was found to be literally alive with them. We saw several flocks of ducks, mallards, teal, black jacks, but they were flying very high, and seldom could be shot. Geese and brant are quite numerous on the lake. Pelicans are also abundant in places. I noticed on the lake on the river bank with an area of several acres white with those snowy birds. On the west bank of the river wild turkeys are met with quite often, and at several points along the M. and N. R. rail shooting promises to be prime. Snipe are quite numerous also in the timber at several places on that road. The first cold snap will no doubt draw a great many ducks to Lima Lake as a levee is partly constructed to prevent the overflow of the bottoms this season, and the effort will be to contract the water area to the lake and sloughs. A. A.

WISCONSIN—*Franklin*, Oct. 23.—Excellent duck shooting on Muskego Lake since the 10th of Sept., about which the blue winged teal began to arrive in enormous numbers. Fred. Caesar, a resident farmer, bagged one hundred and thirty of those delicious birds in one day, and his brother Louis, on the same day, killed eighty-four. This harvest lasted about three or four days. For the last three weeks scarp ducks and redheads have been very abundant, but exceedingly wild and difficult to approach. I bagged 4 heads, 16 scaupers, 3 mallards and 6 blue winged teal on the 16th inst., which was deemed good sport. M. J. E.

MINNESOTA—*St. Paul*, Oct. 25.—Have been out one afternoon just below the city with Reuben Warner. We went for snipe, and failing to find them went into a favorite spot for corn for woodcock earlier in the season. We did not expect to find any birds, but thought we would walk over the grounds for "old acquaintance sake." We had hardly entered the corn before we went a bird just out of shot. W. got him up again and bagged him. In doing so he passed out of thick corn into hazel brush, when his dog came to point and up went another bird. This was repeated a few times, and eleven birds were raised, ten of which went into our bag. E. F. W.

CALIFORNIA—*Santa Monica*.—Mr. John Steere of this city killed 2,051 wild ducks during eight months of the year, ending the first of October.

Santa Rosa.—Since the 15th of September, one dealer, S. Saery, has shipped to San Francisco, besides supplying local customers, 4,311 quail, 5 deer, 17 hare, 37 mountain quail, 11 birds, 24 English snipe, and 8 rabbits.

CANADA—*Montreal*, Oct. 21.—Deer have been killed in the woods within the past twelve days with the velvet on their horns.

FROM SITTING BULL'S STAMPING GROUND.—The following extract of a private letter to the editor of this paper from a former resident of New York and Brooklyn, now located at Sitting Bull, the scene of Sitting Bull's interview with Commissioners, may prove interesting to many of our readers. SUN RIVER, Montana, Oct. 12, 1890.

My Dear Hallock—Many thanks to you for kind remembrance of my "Gazetteer." Had I known you were preparing a work I could have assisted you materially as regards this country of the far Northwest. I have been collecting some of the different kinds of game, and the facilities for reaching it, to send you, as soon as I get time to work it up. My travels have extended far north, from here to Fort Calvary, on Bow River, properly the Soudan, Kotchevan, and I have made inquiries as regards game farther north. I am indebted to works I have read in regard to that remote country, also to officers of the mounted police, who have been at Fort Sosskotchewan, twenty miles from Fort Edmonston, on the Sosskotchewan. Last winter I spent at Fort Walsh, in the Rocky Mountains, and one of your subscribers, an officer, McIlwain, who, by the way, is an enthusiastic sportsman, gave me many hints as to hunting, etc. I asked him to send the FOREST AND STREAM what he has done so far.

In this locality I find you have many subscribers, and I really like to see you to receive an invitation to visit this section. I like to see your old familiar face again, and spend a few weeks in traversing the grand old Rocky Mountains, whose snowy peaks are in full view from here, and take you farther north to Fort Leavenworth and Cavalry, where you would meet with a right royal welcome from the scores of amateur hunters and fishermen. You can streams where it requires no art to catch the sportive trout, and the buffalo and deer, moose, elk, and satisfy any longings you have experienced to hunt such game in abundance. Of small game you would find the famous jack-rabbit, cotton tail, beaver, and odoriferous skunk. Yours very truly, ARTHUR B. KENT.

—We have received from Mr. W. Holberton a hand-book, which he entitles the *Sportsman's Note Book*. It is a form of a diary, and on its blank pages may be jotted the many incidents of the sportsman's day. A portion of the book is arranged so that a record of pigeon, glass ball shooting can be kept.

CAMP'S AUTOMATIC CARTRIDGE LOADER.—There are certain points which a sportsman requires about a machine to load cartridges. Such an apparatus should neither be complicated nor cumbersome, and must distribute powder shot with great accuracy. Such adjustment as may be required, when different charges or gauges are wanted, must be easily accomplished. The Camp automatic cartridge loader, though scarcely a year old, has come greatly into vogue, endorsed by our leading sportsmen. Taking up a single cartridge, easily handled, and working with great expedition, the loader does away with almost all trouble in the preparation of cartridges.

—*Land and Water* says that, "Gun accidents it seems to be almost incredible. In 1874 there were 244 of which nineteen were fatal and sixty-one were serious. In 1875 the total had mounted to 337, of which one was fatal and ninety-seven very severe. Finally the number of accidents amounted to 444, of which seven were absolutely fatal and 103 were very severe. It is evidently on the increase, a fact which sportsmen will well take to heart and endeavor to take more precautions against accidents than they generally do."

\_\_\_\_\_

2. All the shells were loaded precisely the same as nears I could load them, with one black and one pink dye was over powder, and one black dye was over shot. I have no comment to make on the relative merits of either shell, the figures stand for themselves. I could see no difference in the recoil of the paper shells. I think the reliability of the Bridgeport paper shell is worthy of mention, having used a large number in the past three years without having one misfire. I can't say as much for any other paper shell I ever used. —(Add.)

## A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INDOCTRINATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

**Forest and Stream Publishing Company.**

—AT—

No. 111 (old No. 103) FULTON STREET, NEW YORK.  
[POST OFFICE BOX 2332.]

TERMS, FOUR DOLLARS A YEAR, STRICTLY IN ADVANCE.

Twenty-five per cent. off for Clubs of Three or more.

### Advertising Rates.

Inside pages, nonpareil type, 25 cents per line; outside page, 40 cents. Special rates for three, six and twelve months. Notices in editorial columns, 50 cents per line.

Advertisements should be sent in by Saturday of each week, if possible.

All transient advertisements must be accompanied with the money or they will not be inserted.

No advertisement or business notice of an immoral character will be received on any terms.

\* Any publisher inserting our prospectus as above one time, with brief editorial notice calling attention thereto, and sending marked copy to us, will receive the FOREST AND STREAM for one year.

NEW YORK, THURSDAY, NOVEMBER 1, 1877.

## To Correspondents.

All communications whatever, intended for publication, must be accompanied with real name of the writer as a guaranty of good faith, and be addressed to the FOREST AND STREAM PUBLISHING COMPANY. Names will not be published if objection be made. No anonymous contributions will be regarded.

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions.

Nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for dereliction of the mail service if money remitted to us is lost. NO PERSON WHATEVER is authorized to collect money for us unless he can show authentic credentials from one of the undersigned. We have no Philadelphia agent.

Trade supplied by American News Company.

CHARLES HALLOCK, Editor.

T. C. BANKS, Business Manager. S. H. TURRILL, Chicago, Western Manager.

—We have had the pleasure of a call from Mr. Rutherford Stuyvesant, of this city, who has just returned from a successful hunting and fishing trip to Nova Scotia, New Brunswick and Newfoundland. He brings with him, among other trophies, a pair of moose's antlers, remarkable for their symmetry, and a caribou's horns covered with velvet.

In our next number we will publish an exceedingly interesting paper sent us from the Department of the Interior (U. S. Geological and Geographical Survey of the Territories) on the old Inhabitants of a lost Race, which are found to-day in New Mexico and Arizona.

—Captain A. H. Markham, the second in command under Sir George Nares, was lately in St. Louis. For distinguished services during the late polar expedition, Captain Markham was the recipient of the Royal Geographical Society's gold medal. The gallant captain is still a young man, of fine bearing and physique, and is undoubtedly possessed of untold pluck. The captain was en route for Fort Sill. We are very sure that our numerous army friends in the Indian Territory will gladly welcome Captain Markham.

—Dr. T. C. Ryan has opened his new Russian Baths at No. 18 La Fayette Place, this city. This treatment is growing in public favor, and Dr. Ryan's establishment is a model.

THE WOODRUFF EXPEDITION.—The vessel which had been chartered for this tour proving unfit for the purpose, the managers have contracted with the famous ship builder, John Roach, for a new iron ship. The steamship is to be 325 ft. by 40 ft., and being built expressly for the expedition, will be fitted up with every convenience, and will be especially adapted to cruising in tropical waters. The change necessitates a further delay, and the departure has been deferred till next May. The party will proceed to England; then will cruise the Baltic Sea, returning to Paris for the Exposition. Thence they go to the Mediterranean and the Nile, and after that the course will be reversal of the one originally projected.

## SHALL THE NATIONAL RIFLE ASSOCIATION ABDICATE?

IN the early history of the National Rifle Association, the *Army and Navy Journal* assumed to be its organ, from the fact that its most worthy editor was the first President; and the interest he took in the welfare of what was for some years a novel project, made his excellent journal an authority. These exertions, made to place the N. R. A. on a firm basis, must always be recognized, and the association clearly showed their appreciation of Colonel Church's distinguished services by appointing him an honorary director for life, an honor which has never been conferred on any one else.

It does seem, however, as if the *Army and Navy Journal* has lost some of its interest in the N. R. A. for it certainly has permitted some of its contemporaries to surpass it in regard to information on rifle matters.

In the issue of October 27, the *Army and Navy Journal* has made a terrible struggle to come to the front, in relation to the much discussed International Rifle Match, but it is somewhat to be feared that in making this unusual exertion it has entirely overlooked the subject. The *Army and Navy Journal* indulges in a tirade of quite questionable taste, directed against the officers of the N. R. A., for having, in addition to declining to alter the terms of the Centennial Trophy Match, passed a resolution, stating that in their judgment, "it was inexpedient to start another International Match." Such conduct the *Army and Navy Journal* considers so reprehensible that it urges "the abdication" of the powers that be, and the immediate organization of a Representative National Association. In fact, an appeal is made to the rifle shooting public to get up some kind of a substitute association, empowered for the time being to shoot some particular nondescript match or other. This shows what is called the heroic treatment. Admitting, which we by no means do, that the N. R. A. would err in coming to this conclusion, it seems to us somewhat extraordinary that a paper which has plumed itself on being the founder of the N. R. A., should even for a slight difference of opinion be desirous of destroying a flourishing institution, root and branch—one in fact which the whole country looks at to-day with pride.

But unfortunately for our respectable contemporary, to use an expression which its military proclivities will no doubt fully understand, it has gone off at half-cock. In point of fact, the final resolution which the *Army and Navy Journal* thinks so fatal, which has excited its ire, was never passed at all! The record of the Association will show that this offending resolution was tabled, and now peacefully slumbers. As the course of the *Army and Navy Journal* has made an item of news of an action which did not take place, we publish the so-called resolution in our rifle column. Some curiosity has been expressed by the members of the N. R. A. to learn what must be done under the circumstances, as they may be likely to be left out in the cold. We can assure such timid persons that no instance or precedent is known of an association being destroyed by a resolution, which is not a resolution. The writer of the article in the *Army and Navy Journal* may be compared, then, to Samson pulling down the columns of the temple, because the Philistines annoyed him, only that in the present case there is no grievance, and not much of a Samson either.

## THE WHOLESALE POACHERS ON THE SACRAMENTO.

SOME comments have been directed toward this Journal, growing out of an article published in our last issue, in which we spoke, in quite plain terms, about the California salmon interest, and how the law was utterly disregarded on the Sacramento River. Newspaper notoriety, of a peculiar kind, is by no means desirable, and we are sometimes chary of giving publicity to the names of individuals supposed to be engaged in breaking the laws. With us, hearsays have been paid no attention to, as we have always required absolute proof before we have been willing to exercise even the disagreeable power of casting odium on law-breakers. We congratulate ourselves on the caution we have exercised. If we have made any mistakes by accusing persons wrongfully of breaking the laws applicable to game or fish, we have yet to hear of such errors on our part.

In the case of Messrs. Emerson, Corville & Co., of Collinsville, there can be no mistake. These canners have rented Mr. Booth's former establishment on the Sacramento, and up to the first of August, put up something like 10,000 cases of salmon. Then they pretended to close up their establishment, in order to engage in the innocent pursuit of fruit and vegetable canning. This was nothing more than an ingenious blind. The fishermen in the river, for the most part, are Greeks and Italians, who are quite as indifferent to the laws as certainly are Messrs. Emerson, Corville & Co. The usual price paid these fishermen was twenty-five cents for a salmon of sixteen pounds, then this price was increased. On the first of August it was intimated to the fishermen, in a solemn kind of a way (perhaps with a wink) that, "It was against the law to catch salmon now—but that if they did happen to find any very prime salmon in their nets, that may be thirty cents would not be out of the way for 'em." Of course the Greeks and the Italians found, after this warning, no end of salmon in their nets, and there is no doubt but that from 1,600 to 2,000 salmon were caught every day for a month or more, as the cannery was running night and day (not on fruit or vegetables) through the close season of this year. Of course, how

many cases of salmon Messrs. Emerson, Corville & Co. put up in the close season will never be known. Another little invention used by these people to account for the presence of forty-four white men and as many Chinese at their works was, that all hands were busy in the manufacture of cans for the season of '78.

Now, the nearest place of note to Collinsville, is Antioch. The Fish Commissioners of the State, who are supposed to be gifted at least with common sense, to use the Biblical term "sped to Antioch, seeking for justice." But little of that rare commodity did they find in Antioch. All civil and legislative functions seemed to have been concentrated in one gifted individual there, who combined the varied occupations of Store Keeper, Justice of the Peace, Wharfinger, Postmaster, Express Agent and Telegraphic Operator. Besides these few callings, this person has a keen eye to business. It was the Justice of the Peace who traded with the fishermen. Messrs. Emerson, Corville & Co. gave orders on the postmaster and there was a general dickering all around. Of course, then, this much-employed custodian of the peace and administrative and executive head of the laws could see nothing in the whole matter, and so far the California Fish Commissioners went on their ways out of Antioch, saying: "Lo! there is no justice in the land!"

Now, it is bad enough at any time, or under any circumstances, to break the laws, but to use an English expression, there is something peculiarly "cheeky" in the action of the firm we have, unfortunately, to do with. Exactly at the head of this river is the precise place where the eggs of the salmon have been collected for general distribution all over the country, and where, for the erection of the salmon works, a very large amount of money has been spent. There is not a river in the whole Union, East or West, North or South, where greater injury could be done to the fishery interests of the country.

We are glad to learn that the leading San Francisco papers have taken this matter in hand, and we trust that the good sense of the Californians will be on the side of the Fish Commissioners of the State. As much as anything else, it is to the labors of these very Commissioners that the Sacramento River is fruitful with fish once more; and it seems worse than absurd, that the very river which shows the best results from their care should be exactly the stream where law-breakers should have the power to inflict the greatest injury.

The FOREST AND STREAM never enters into political topics, and though we have been assured that somewhat of demagoguism has been allowed to enter into this topic, as far as relates to an opposition to the Fish Commissioners, we can hardly credit that the intelligence of the Pacific State can ever be on the side of those who willfully shape their conduct in opposition to the general welfare of the community.

## AN APOLOGY TO A TRUE POET.

IN an issue of this paper of August 9th, we regret to state that an injustice was done to the most distinguished of our American poets, John G. Whittier. A poem entitled, "The Cry of a Lost Soul," was published by us as "Translated from the Portuguese for FOREST AND STREAM." Struck at once by the elegance of the language and the beauty of the lines, the poem found a ready place in our columns. Quite properly Mr. Whittier's attention was directed toward the poem, of which he is the author; and he has written us a letter which we cheerfully publish. We are only glad to make the *amende honorable*, and to frankly allow that we were imposed upon. There is something even ludicrous at times, when such plagiarisms are laid bare, for instead of "The Cry of a Lost Soul" having been translated from the Portuguese originally into English, the verses were written first by Mr. Whittier, and were then rendered into Portuguese by His Majesty Dom Pedro, Emperor of Brazil. In fact, no more graceful compliment could have been paid to the gentlest and sweetest of our poets:

TO THE EDITOR OF FOREST AND STREAM:

My attention has been called to a poem in thy paper purporting to be a translation from the Portuguese, and to have been written by the Emperor of Brazil. A note appended to it places me under the charge of plagiarism and of falsely claiming the poem as mine.

The poem is mine, and was translated into the Portuguese tongue by the Emperor Dom Pedro, together with other pieces of my own and of Longfellow. I have by me a copy of the translation forwarded to me by the Emperor, in his own handwriting. Be kind enough to set the matter right, and relieve me from a charge I never expected to be brought against me.

Thy friend,

JOHN G. WHITTIER.

Amesbury, 10th Mo., 28, 1877.

P. S.—If I remember rightly the pretended translation was an exact copy of my poem, word for word.

## HIGH PRICES OF SPORTING GOODS.

THE cost of nearly every material or implement used by sportsmen is much too high, and out of all proportion with most articles that enter into ordinary use or daily consumption. It amounts to a prohibitive tariff to persons of moderate means, and actually discourages thousands from engaging in sports of the field and the stream, whose tastes lead directly thereto, and whose desires being thus nipped are perhaps crushed out forever. In fishing rods, reels and tackle the prices are generally beyond all reason, and the same may be said of other branches of trade that cater to the lovers of out-of-door sports.

The old proverb of "penny wise and pound foolish" never applied more directly. It would seem that cupidity argues that it will be better to take dollars from the few than dimes from the many. But prohibitory or exacting rates for goods

curtail the market and decimate the buyers, so that it would seem politic at least on the part of dealers to put their prices so low that purchasers may be attracted and multiplied. The *FOREST AND STREAM* has proved the direct and substantial benefits of printing a cheap paper. Formerly it published sixteen pages for \$6; now it gives twenty-four pages for \$4, and to clubs of three or more for \$3 to each subscriber. This is equivalent to eight pages per week for fifty-two weeks in the year, or 416 pages of reading matter per year, for \$1. We feel certain that if dealers would first look to their price tags carefully, then consider the hard times, and after that the wants of sportsmen and the vast army waiting to be supplied, they would think on these things as seriously as we have done and now do, and not only be advised but convinced.

We have been prompted to "break loose" on this subject, just at this moment, because it has been brought to our notice by an intelligent and wealthy citizen of San Francisco, who is now visiting New York. He says that the people of the Pacific coast find it far preferable to purchase their goods direct from England than from Eastern houses, simply because they are vastly cheaper. It is true there will always be a class of buyers of superior guns, rods, and dogs, just as there is of high-priced Jergensen and Baguelin watches. The trade should provide for these; but it should also provide good, serviceable goods at moderate prices for depleted purses. It is especially incumbent upon us here in America to avoid creating an aristocracy of sportsmen, and to prevent even the impression that our sportsmen are an exclusive kid-glove and silk-stocking fraternity. This impression will certainly obtain if exorbitant prices prevent any but wealthy persons from buying sporting goods. Even now the humble bushman or moss-backer who hangs up his cast iron \$5 muzzle-loader after a hard day's work and empty bag, looks with envy upon the man in velveteen and cords, who sports his gold repeater and \$350 gun. The moment legitimate field sports are curtailed within the limit and means of a few individuals to the exclusion of the multitudinous masses, we may well bid good-bye to game protection in our wilderness places, and look for tame birds and confiding deer in close preserves, where, as in Great Britain, moneyed men fence them in for their periodical diversion.

We cannot, perhaps, estimate how much the cultivation and dissemination of a proper taste for out-of-door sports depends upon the low prices of sporting goods, and we shall hold our dealers in a measure responsible for failure if they do not mark down their extravagant prices, and give us a rod, reel and line that will catch fish scientifically, or a gun that will not shake to pieces in a year, without making the primary cost so great as to make the fish and game we catch the most expensive luxuries we eat.

**CARDS OF REFERENCE FOR SPORTSMEN.**—A very good wrinkle is casually referred to by our Washington correspondent in his last week's letter. He says that the Game Protective Association, of Alexandria, Virginia, is furnishing to its members reference cards for their protection while hunting among the farmers. The cards set forth that the bearers are legitimate sportsmen, giving their names and residences, and in every way designating them to be respectable and responsible men out for a day's shooting. The farmers are beginning to take kindly to these gentry, now that they have ascertained that they are really the protectors and propagators of the birds they shoot, and do not deplete on chicken houses and burn rail fences, but respect their property rights. No measure that we can devise or suggest seems better adapted than this to promote the mutual interests of farmers and sportsmen, and we respectfully urge upon our game clubs to adopt it and issue cards of reference to their members. This will make the clubs really responsible for their good behavior in the field, and we have no doubt that any farmer who can prove actual depredations can prosecute and recover from the clubs for any damages caused by its members. The quail, or partridge, is almost the only game bird left among the fields of our middle and Western States, and since the gunners must have sport, it will be well for the farmers to join them in a mutual benefit association. The sportsmen, by protecting the birds and planting colonies here and there, increase their numbers. All they ask in return is the privilege of shooting them in season, while they guarantee to the farmers immunity from depredations of pot-hunters, by making it impossible for any one to snoop over a farm unless he carries his card of reference from his club, which would be even a stronger guarantee than a letter of introduction from a friend. It will be readily seen, if this plan is adopted throughout the whole country, that its effect must be to increase the numerical and moral strength of clubs, and inferentially to promote the laws and multiply the game. Will the other sporting papers indorse these views and aid the work?

**YET ANOTHER SPORTSMAN'S JOURNAL.**—We offer our congratulations to *The Country*, both generally and particularly; for one day last week a journal with the above caption, devoted to field sports, made its debut. With an exceedingly neat head, a medalion of a setter being flanked right and left by a polo party and a mail coach, *The Country's* outside page is quite attractive. Of course, with the first issue of a paper a great many difficulties, simply of a physical character, have to be overcome. If, then, in this new aspirant to public favor, in the cut of the postulant's clothes alone, there may be nothing which is either novel or startling, still he will doubtless have a fair claim to public attention. The editor, Mr. W. M. Tileston, having assisted for some time in conducting

the *FOREST AND STREAM*, ought to have a certain amount of experience in such matters. To natural talents, Mr. Tileston adds a great deal of tact and good judgment, with familiarity in such topics as he intends treating. Of course, starting a new paper in these precarious times is always a venture at the best. The initiatory movement in a paper is a good deal like that in a run-away match. The trouble is not as much in the running off as it is the come-to, which is sometimes quite difficult. A great many new journalistic enterprises are started in New York. For one genuine success there are a thousand failures. It behooves us not to philosophize over the causes of ill success. One thing, however, is absolutely positive—that when misfortune comes to a paper it is never the public who are at fault. The history of every paper which has been successful is the story, first, of natural tact or journalistic ability, and afterward of great industry, of wonderful patience, and the surmounting of untold difficulties. Looking casually over a kind of charnel-house publication, which seems to gloat over the misfortunes of newspapers, we find the following: "Sixty-eight newspapers were started in the United States and Canada during September of this year, 1877. Of these, four were dailies, 48 weeklies and ten monthlies, the remainder being semi-weeklies and semi-monthlies. During the same month 59 publications suspended, six of which were dailies, forty-five weeklies, two semi-weeklies, five monthlies and one semi-monthly. The largest number of new publications during the month are credited to New York. The most suspensions occurred in Illinois."

Certainly, during the same period of time, untold businesses of an entirely different kind have been started, whose ultimate success will be quite as problematical as that of the newspapers. We disclaim, however, any inclination to cast a wet blanket over a new journalistic enterprise, even in a peculiar line of business, which we must think to-day is more or less fully covered. There is always room for more, even should the doctors crowd the patients. In conclusion, we may quote a well-known aphorism of Josh Billings:

"Never take the bull by the horns, ying man, but take him by the tale; then yu kan let go when yu want to."

## VACATION RAMBLES IN MICHIGAN, WISCONSIN AND MINNESOTA.—No. 3.

BY THE EDITOR.

BRETHREN:

November 1, 1877.

Recurring frosts and occasional flurries of snow are driving the wild fowl southward; and as they honk overhead or dabble noisily among the wild rice stubble for the grains that now lie strown upon the surface of the ponds and lakes, I am reminded that a full month has elapsed since I lay *perdu* at eventide and in the early gray of the morning upon one of those "passes" so famous in Wisconsin and Minnesota, waiting in vain for an expected flight of ducks which never came. It was too warm then for wild fowl, and an unusually hot September had scarcely given place to that modified temperature which makes the Indian summer so captivating to the man who values pure air and sunshine more than Diogenes. The only boon the old philosopher asked, you will remember, was that his solicitous friends would stand aside "out of his sunshine!" A month ago a few wood ducks local to the neighborhood, and an occasional bunch of early mallards, were the only flights we saw, and they were few and far between, as are the flights of angels earthward. Few, indeed, fell to our guns. Too high they flew, and when we would watch them afar off like specks against the zenith, the brave Colonel of the Second Minnesota Regiment would say: "Mark up!" like the youth in the poem whom neither old man nor winsome maiden could persuade to stay below. The youth paid no attention to *radin*. Now, however, the season in the northwest is at its best, and I fear I almost envy the gunners who are counting feathered trophies by the score. Glorious sport they are having in these days. Even now fragrant testimony thereof is ascending to my nostrils in grateful odors from the kitchen (I am writing my letter at home), where a plump brace of canvas-backs, presented by our portly friend, S. H. Turrill, of Chicago, is being artificially prepared by a cook who never fails. I said "a brace," I should say a pair—male and female. Together they erst winged their hopeful flight along the margin where the succulent wild celery grows, and sought their breakfast in banquet halls where dead ducks sat around, lifelike in their attitudes of dissemblance; then, together, they fell lamenting victims to their misplaced confidence; and now, "as beautiful in death as in life" (nay, even more beautiful, *to us*, on closer inspection), they will together dissolve and float away to the inevitable duck-heaven upon clouds of their own steaming juices, flavored by good old port! Verily, it is nice to be a duck!

How easily are our thoughts led off by trifles from the more serious obligations of our lives! My roast duck, and what the boys are now doing with their guns in Wisconsin and Minnesota have nothing to do with my summer fishing for trout, bass, pike and grayling in Michigan, which I proposed to write of when I began this letter. Not to say that there are no ducks in Michigan, by any means, for there are rafts of them on many of the lakes and rivers; but there are no canvas-backs there that I have ever heard of, although they are common in localities in Wisconsin, where the vallisneria or wild celery grows. I have never seen the wild celery in Michigan, yet it

\*Brethren: I'm growing too old now for this sort of thing. Forgive me! This is probably the last time I shall ever attempt to perpetrate a joke.

may be there. Its absence will account for the non-appearance of the canvas-backs.

As to the fish. If any angler wishing to visit Northern Michigan will send to the office of the Grand Rapids and Indiana Railroad for one of Mr. J. H. Page's very excellent guide books, and follow the maps and directions therein, I'll guarantee that his lines will be cast in pleasant and profitable places, and that the summer sun will nowhere beam upon him with more benignant and modified temper. The railway company mentioned have provided camp cars for excursion parties, fitted up with sleeping-berths for nine persons, and containing stove and utensils, pantry, closets, tables, ice chest, etc., and in short everything that is necessary for comfortable living, except bedding and dishes, which those chartering cars must provide. This makes camping out a high art. The traveling coach has only to be shifted off on a siding near the locality to be hunted and fished, and it then becomes a house and permanent headquarters. The car is furnished at the surprisingly low rate of \$10 per day, so that the expense to a party of nine is reduced to a minimum. There are scores of excellent localities along the line of the road and its branches and connections which can be thus reached; those that cannot are few. One must wonder why these facilities and advantages are not so eagerly seized as to keep the demand for them constant.

When the revered Joel Penman took his memorable sleigh-ride, he described the party as being composed of three persons. He says: "There was Joel, me, and myself." One cannot too highly commend his endeavor—as it should be the ambition of every man—to make the most of himself. In like manner, there were three of the writer. Nevertheless, and notwithstanding his triple representation, it was impossible for him to occupy the full complement of nine berths which the camp cars tendered him afforded. Even three at a berth could not be thought of. So he determined to forego the luxury and rough it in the old style. Just at this juncture fortune threw in his way a gentleman named A. B. Turner, known throughout Michigan as the senior editor of the Grand Rapids *Eagle*, and an extraordinary "man of letters," having been postmaster for nine years; also as the best bait-angler in the State—not to say that he could not manipulate a fly with the best, but in his speciality he excelled all others. Yes; it was indeed a treat to watch him impose upon the credulity of a sagacious trout! No perplexity of currents or tangle of roots prevented his invariable success. The dexterous management of his grub or squirrel-baited hook was a marvel to new beginners. But anticipate.

It was with this Waltonian thoroughbred that I determined to cast my lines. A brief interview with him ended in a solemn compact to "go-a-fishing" and divide the spoils. I do not mean by this that we agreed to divide the fish that were spoiled—by no means. It was not our purpose to catch trout in wasteful numbers, but rather to "spare the rod." [The antithesis in the old proverb applies only to truant school-boys.] And so the shades of an early August evening found us in a Woodruff sleeping car, en route for Petoskey, the terminus of the main line of the road, and our first objective point. A branch leads off from Walton Station to Traverse City, on Grand Traverse Bay, twenty-six miles distant. Walton is 115 miles from Petoskey, and the intermediate country is where the angler loves most to dwell. If the stranger will conceive an ovate tract of country interspersed with many lakes, large and small, bounded on the east by the main railroad, on the south by its branch, and on the north and west by the waters of Lake Michigan, of which Grand Traverse Bay is a considerable part; and remember that very many streams cross the railroad and flow into the intermediate lakes and thence into Grand Traverse Bay, he will obtain a fair idea of the "lay of the land" and the fluvial geography of the country and the accessibility of the waters which he wishes to fish. At the same time he must bear in mind that the streams leading to the lakes westward from the railroad run through a wilderness navigable in part by skiffs only with difficulty. If he wishes to rough it in camp, and is provided, he will do well to go in by these streams. In some cases there are primitive stage or wagon routes, and the distances being short the journeys are not tedious. If he wishes to indulge this sense of comfort he will continue by the railroad to Petoskey, and by taking steamboat there he can touch at the various landing places along the Bay; and from these points little excursion steamers ply through the several chains of inland lakes to the mouths of the various streams that he has already crossed at the railroad. These streams contain trout, grayling, or pike, and occasionally all three. As there are lodging houses throughout, more or less comfortable, one can scarcely imagine an excursion that can be made with more facility or comfort by either ladies or gentlemen. It is not necessary to depend on the lodging-houses either. Tents and camp stuff can be carried on the steamboats, and sites may be located where there is no brush to be cleared out, and where milk, eggs, vegetables and fresh bread, or any other requisite can be obtained at shortest notice. Four days is sufficient to traverse the whole country if one is making a hasty tour. Steam or sailing yachts can enter the lakes either by Charlevoix or Cheboygan, and secure a range and variety of scenery that will scarcely find its equal. Cheboygan is on the Lake Huron side, and Charlevoix on the Lake Michigan side. The features of the two routes are very different, and one can hardly determine which has the greatest charms. The one is accessible to the other, via the Strait of Mackinaw.

Emmett County is the northernmost part of the peninsula. It is almost a circular island, Petoskey is on its periphery, and

a steamer can start from there and cruise along its shore north-west, west, and northeast to Mackinaw; through the strait east and southwest to Cheboygan; and thence by the chain of lakes south and southwest back to within six miles of Petoskey, a distance which is now completed by stage through a dense wilderness. This is one of the advertised routes of travel, and most delightful it is.

Now let me go back to Walton Junction, where the railroad branch makes off to Traverse City. I'm determined to describe this country so that strangers will no longer be puzzled. A map will assist. At Walton one can get good board, and by driving three miles south to the famous Manistee River, or getting the railroad people to drop him off, he can enjoy the new sensation of catching grayling. Parties intending a long stay had better come prepared to camp. The river is navigable, and boats are required. The current runs swiftly—about four miles an hour. The Manistee is one of the best grayling streams in Michigan. It empties into Lake Michigan some seventy miles to the south-east. Four miles north of Walton, journeying toward Petoskey, is Fife Lake, a village of 300 people situated on the shore of Fife Lake, which contains bass and pike. Six miles north is the south branch of the Boardman River, containing trout. At this point fishing must be done chiefly by wading, on account of the brush. The river runs south, then east and then north, for forty miles, and empties into Grand Traverse Bay at Traverse City. Good roads run to these streams. Board, \$1.50 to \$2 per day. It will be seen that Fife Lake is good headquarters for the angler, affording at least four varieties of excellent game fish. Thirteen miles further the railroad crosses the north branch of the Boardman at Kalkaska, a village of 300 people located on that stream; and yet three miles further on it crosses Rapid River, by which a boat might be worked through to Elk Lake and thence to Grand Traverse Bay, some forty miles distant. I ascended the Rapid River for eight miles from its mouth near Elk Lake, and found it much encumbered with fallen trees and brush. After leaving Kalkaska the route of the railroad is nearly parallel with what is known as the chain of Intermediate Lakes (intermediate between the railroad and the bay), and within a few miles of the headwaters of the Intermediate, Grass, Jordan, Deer and Boyne Rivers, all most excellent trout streams; and the intervening country is a wilderness and impracticable. Besides, these streams can be easily reached from their mouths in a method which I have already designated. Thirteen miles north of Kalkaska is the town of Muncelona. A stage runs from here to York Lake and Spencer Creek, distance twelve miles. Torch Lake communicates with Elk Lake. A steamer can enter Torch Lake from Lake Michigan, and, passing through connecting waters, come out at Lake Michigan again at Elk Rapids. There is a good hotel at Muncelona called the Muncelona House, kept by Perry Andrus, which accommodates forty guests at \$3 per day and \$7 per week. [One inducement to visit Michigan is its very reasonable hotel charges.] Thirty-eight miles north of Kalkaska, and twenty-five from Muncelona, is Boyne Falls Station; from this place there is a stage line of five miles to Pine Lake, through which there is communication by steamer via Charlevoix into Lake Michigan again. The Boyne River is a fine trout and grayling stream, and some few anglers fish it down through the woods into Pine Lake; but its upper two and a half miles is a tangle of forest. Deer Lake is two and one-half miles from Boyne Falls. It affords good bass fishing. Into Pine Lake flows the celebrated Jordan River, a noble trout stream, with a few grayling in it; and also Horton Creek, containing many trout. Deer River joins the Jordan a mile or so above its mouth. It contains trout and grayling. Pine Lake itself contains pike, bass and muscalonge. It is sixteen miles long, of which its two branches are each nine miles. Thence to Petoskey the railroad traverses a wilderness; but there are several cross-country roads by which Torch Lake, Intermediate Lake and other points can be reached.

We come now to Petoskey, where I shall leave the reader. In my next letter we will make the grand tour together and learn what virtue there is in squirrel meat for bait.

HALLOCK.

**A COLONY FOR FLORIDA.**—There are really but three papers in New York which seem to take any interest in the most lovely country in the Union, which is Florida, and these three journals are the *Florida New Yorker*, the *Sun* and the *Forest and Stream*. From the *Sun* we learn that,

"About sixty artisans, clerks and small merchants of this city met on the 26th of this month to receive the report of a committee on the purchase of land for the St. John's Co-operative Colony of Florida. It was reported that a tract of ten thousand acres of land on the St. John's River, twenty miles from Palatka, had been offered to the colony for \$1 an acre.

The first idea, which was conceived but a couple of months ago, was to engage fifty young men, married or unmarried, to organize a colony on the co-operative plan, and buy about two thousand acres wherever they could get it cheapest in Florida, on the condition of paying part cash only. The organizers were surprised and gratified to find offers to join the colony accumulating. The list numbers over one hundred, and the officers hope to close the books with two hundred and fifty names, which will be sufficient to settle the ten thousand acres of land it is proposed to buy. A representative of the colony is in Florida, and another, Mr. Hines, will leave shortly to institute a search into the title of the land. It is embraced in an old Spanish grant."

## GAME PROTECTION.

—The meeting of Virginia Fish and Game Protective Association at Richmond, last evening, was of unusual interest, and we shall publish a full report of it from our special correspondent.

The following communication, which has been received from a Syracuse correspondent, we cheerfully publish:

I have noticed lately in your most excellent paper several articles reflecting rather severely upon the sportsmen of Onondaga County.

We are not so inactive as asserted in the articles you have published. We are doing all we can in a quiet way, and without advertising what we propose to do, and so warn the enemy. As yet we have confined our efforts to one thing and one locality, and that is to stop the net fishing on Onondaga Lake. We do not as yet propose to arrest any one, but simply find the nets where set and destroy them. We have, during the last two months, found, raised and destroyed seven gill nets in our lake.

Our lake is so deep that other than seine nets cannot be used to advantage. The nets destroyed were found set in from thirty to sixty feet of water. We have fine fishing in the lake, especially for black bass, which run large, some having been caught this season weighing over five pounds and many over four pounds.

We know that it is notorious that net fishing is largely carried on there, but we cannot very well do anything with them, for this reason: The boundary line between Onondaga and Oswego Counties along Onondaga Lake is low water mark along the south shore of the lake, so that the lake lies entirely in Oswego County. Our law makers at Albany have enacted that in order to punish in Onondaga County a net fisherman in Onondaga Lake, it must be proven that the net was set and the law broken within 200 yards of the line of Onondaga County.

On this account we are practically powerless, for we have found after a protracted and energetic effort that we have been unable to get proof to comply with the law. A year ago we arrested thirteen men, and had them indicted in this county, but they have never been tried, for the above reason.

**VIRGINIA.**—Complaints are made by the Richmond *Whig* and the Norfolk *Public Ledger* that the game laws prohibiting the capture or sale of partridges are openly set at defiance by restaurant keepers in those cities.

—A correspondent writing from Salem, Oct. 20, says:

"The law now prohibits the killing of quail in this State until the first of November, yet hundreds of them are now killed. What do you think of a country where quails are killed and marketed from September till March of every year? I know of several parties who make a business of buying game in the close season. One person has been running over our road buying game from St. Louis east, carrying from fifty to seventy-five dozen quails into St. Louis every trip. The law is now off in Missouri, and our game dealers are doing a lively business; they have men out hunting every day. It is no uncommon thing to see fifty or sixty quails lying in the backroom of a game buyer's shop in the close season. What can we do? The law-abiding citizens are, I think, afraid to have the law enforced, for fear of having their property destroyed. I think it is the game buyers who are to blame for this disregard of the close season. By offering big prices they induce pothunters to shoot at any season of the year. We will have to stop the marketing of small game in this State at all seasons of the year, or the cheerful whistle of Bob White will be a thing of the past.

J. B.

## SCARCITY OF QUAIL IN CONN.

BRANFORD, CONN., October 19, 1877.

EDITOR FOREST AND STREAM:

Allow me to call your attention to a subject, which, in this vicinity, is sadly puzzling our sportsmen, viz.: the scarcity of quail.

If there had been but few birds in the spring, or if there had been insufficient food, the present lack of birds would readily admit of explanation. But neither of these conditions can stand as causes, for it is the testimony of the farmers that quail were plenty in the spring. Again, more grain has been harvested in this section this summer than for many years previous. In fact, all the conditions appeared favorable for the growth and increase of quail, and seemed to warrant the highest expectations of our sportsmen. Therefore, the almost unprecedented scarcity of birds this fall, is a surprise as well as a sore disappointment. Sportsmen have been active in their endeavors to account for this anomaly, and as a consequence, many theories are in circulation. But none of those that I have heard fulfill all the conditions.

The most plausible of these suppositions, and the one that is fast gaining credence, assumes Paris green as the agent by which the quail have been destroyed. This explanation appears all the more probable because, until this year, the poison has been but very little used. If Paris green is the cause of the scarcity of quail in this section of the country, it must have exerted a greater harm where it has been more extensively used.

The subject is worthy of investigation, as it may involve the total annihilation of the quail. Any information which you may be able to afford will be awaited with interest, and received with gratitude.

A. E. HAMMAR.

[We cannot, for a moment, admit the plausibility of the Paris green theory. There is no reason for supposing that quail are injured by the poison, which has been extensively used in all sections of the country for some years past. Quail have, this fall, been scarce all through Connecticut, but the true reason, we take it, is the fact that they are still "running," and have not yet settled down onto their fall feeding grounds; and besides this, owing to the abundance of their food, they are much scattered. It is always a hard matter to find quail in October, and we think that sportsmen in general will bear us out when we say that in this latitude, the best shooting for quail does not come until the weather is quite cold. The running of quail is an interesting subject, which our correspondent will find treated at some length in "Hall's Gazetteer" under the head, "Quail."—En.]

## The Rifle.

### SHALL WE HAVE MORE RIFLE RANGES?

The National Rifle Association proposes that in the annual army appropriation a fund shall be given for encouraging and aiding rifle practice in the uniformed militia of various States and in the army. The N. R. A. advocates the establishment of rifle ranges in all the States, and that prizes be awarded, and that the Government provide means for the same. This demand, if we can call it such, has every claim to the respectful attention of our legislators. It seems, as it were, to be a logical sequence. Since it has been shown that the militia of such States as California, New York, Connecticut, New Jersey and Massachusetts have exhibited wonderful proficiency as marksmen, why should not the citizen soldiers from all other portions of the Union be equally skilful with their arms? It is practice on the rifle range, the systematic philosophical study of the arm, which, perfecting the individual soldier, has given effectiveness to the whole. It would be waste of common sense to argue this matter.

That steadiness under fire, endurance and obedience can only be acquired by drill and discipline we readily acknowledge, nevertheless the single capabilities of the men, as adding to the effective power of the whole, seems to have been too long neglected. As education has increased, the better appreciation of the soldier has permitted the ordinance officer to place in the hands of his men arms of greater precision. The mechanical facilities of the arm, such as rapidity in loading, can be readily acquired in the barrack-room, but the true efficiency of the rifle can never approach to its maximum save by practice on the rifle range. When one thinks of it, the pomp and circumstance of war have been wonderfully sobered down of late. Men for military service are no longer dressed finely, but comfortable. As to arms, such ornamentation as was once lavished on them would be considered to-day as in exactly inverse ratio to their usefulness. The dress-parade condition of the soldier has then somewhat passed away. The heroic element in war has been superseded by a something which, prosaically enough, seems to partake of a mathematical calculation. A great General, even a Moltke, when he reads over the terrible list of the Germans killed in the Franco-Prussian war, some 60,000, does his best to find out how many shots the French poured into his lines. Certainly to a cartridge, that Prussian knows how many his own men expended on the French. In such grim books as he keeps, he credits his cartridges, and debits his dead foes. With the thorough study of small arms, averages of destruction are brought down as close as are life insurance calculations. It is not that so many shots ought to, but they must, in modern warfare, strike exactly so many men or horses. The time of improbabilities has passed away. Creedmoor and Wimbledon are the schools where all the laws of military destruction, at least in small arms, are definitely determined. If then the efficiency of both our regular troops and of our militia is to be brought up to its maximum, it is only by means of the rifle range that it can be done.

**IMPORTANT RESOLUTION OF THE NATIONAL RIFLE ASSOCIATION.**—At a meeting of the Executive Committee National Rifle Association, held Oct. 30, 1877, the article in *Army and Navy Journal*, of 27th inst., was referred to, and the following unanimously adopted:

Resolved, That the Committee have observed with astonishment and profound regret the attack upon the National Rifle Association as a National Institution, which is contained in the *Army and Navy Journal* of 27th inst.

Resolved, That the matter be referred to a committee of three—of whom the President shall be one—to decide what action is proper to be taken under the circumstances, and to report at the next meeting of the Board of Directors.

Gen. Wylie and Col. Wingate were appointed as remaining members of the committee.

[We beg to state that our comments on the article in the *Army and Navy Journal* were written by us some days before the action of the National Rifle Association.]

**MASSACHUSETTS.**—Boston, Oct. 24.—At the annual target shooting of the State militia, at South Framingham, yesterday, the Charleston Cadets won the first prize and the Roxbury City Guard the second.

**MASSACHUSETTS.**—At the range of the Massachusetts Rifle Association, Walnut Hill, on the 25th, Match No. 2 upon the fall programme was shot. The distance fired was 200 yards, 300 yards, seven rounds to each man; best possible figures, 70. The first prizes were the Peabody-Martini breech-loader Creedmoor rifle. The prizes are given when three-quarters of their value has been paid in. The following are the best scores:

|                   | 200 yds. | 300 yds. | Total |
|-------------------|----------|----------|-------|
| D Kirkwood.....   | 25       | 27       | 52    |
| C H De Zorzi..... | 30       | 25       | 55    |

Match No. 3 was also shot. The distances were 300, 600 and 1,000 yards, ten rounds each man, standing at 300 yards, and any position at the other two distances. The prizes were a bronze medal of the National Rifle Association and a gold and a silver medal of the Massachusetts Rifle Association. There will be five shootings, and the best three average consecutive scores take the prizes. We give the leading score:

|                  | 300 yds. | 600 yds. | 1,000 yds. | Total |
|------------------|----------|----------|------------|-------|
| W H Jackson..... | 39       | 49       | 47         | 135   |

**CREEDMOOR.**—On Saturday last the day was rainy and cold, and for a concluding match, perhaps the wind-up of the season, the attendance was not large. The Remington match, for \$800 gold, was unfortunately again postponed. The contest was between members of the Amateur Club for the bronze medal. The following are the scores:

|                         | F Lamb, Jr.          | W M Farrow. |
|-------------------------|----------------------|-------------|
| 53-55-56-56-54-55-54-57 | 22-53-55-54-53-55-50 |             |
| 34-55-55-55-55-55-55-55 | 40-55-54-55-55-55-55 |             |
| 45-55-55-55-55-55-55-55 | 65-54-55-55-55-55-55 |             |
| Total.....              | 238                  | Total.....  |

## BOATS AND YACHT-BUILDING.

7th Paper.

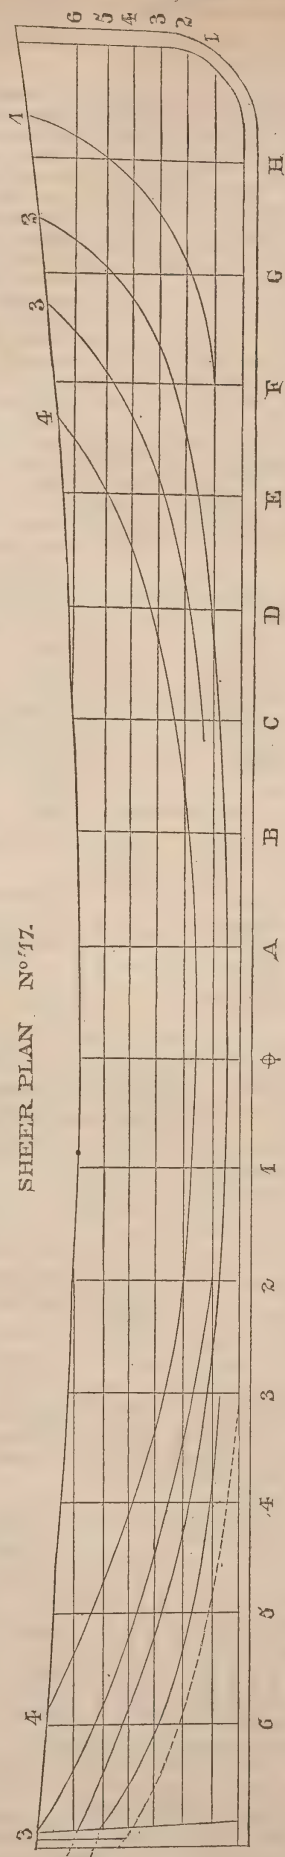

BY NAUTICUS.

In constructing full modeled boats and yachts, either a model or drawing of the proposed vessel is requisite. Boat drawing is a simple mechanical operation, soon learned, and requiring but few tools; indeed, it is impossible to construct a full modeled boat accurately without a drawing. From the drawing we obtain measurements that enable us to construct a "model" if one is wanted. Models, however, are of little use, except to look at. On this subject allow me to quote "Marett," an English author. He says:

"Some there are who have a collection of nothing but models, which serve in the place of drawings. Now this system of model-making has had a most pernicious influence in yacht building; no correct idea can be formed of the properties or qualities of a vessel from a model, unless it is made from the drawing, and if so, then it is useless, except as a toy. To imagine that the nice adjustments of centre of gravity, areas or displacements will be obtained from a model is ridiculous."

The drawing is made on paper on a reduced scale, and, after the lines are all perfectly adjusted, is copied on the floor of a room to the full size of the boat to be constructed. The technical name of the last operation is "laying off on the mould loft." From the full size drawings on the mould loft floor, the patterns for the different timbers are made, and all the bevels and measurements taken. The materials required for drawing will be: first, a good drawing-board made of soft pine, three feet wide and five feet long; one ruler or straight edge, four or five feet long with one edge chamfered down thin; one ruler twelve or fifteen inches long; a square or right angle; drafting scales; a pair of dividers; one "batten" of lancewood, or wood of similar quality, four feet long and one-fourth of an inch square, planed true, so that it will bend evenly from one end to the other; two or three shorter "battens," from one-eighth to three-sixteenths of an inch square at one end, and tapered uniformly to a point at the other; flat-headed engineers' tacks for fastening paper to the drawing-board. These are all the tools necessary, but a box of mathematical instruments will be handy sometimes. The "battens" are usually held to the curves by lead weights, weighing six or seven pounds each, and shaped like diagram number twenty; the lower side of weights should have paper pasted on, to prevent soiling the drawing. Instead of the weights I use common pins, set upright through the points determined on in the drawing. This method is not as neat as the first, but for all practical purposes is just as good. The drawings are three in number, and consist of the "sheer plan," diagram number seventeen; the "half-breadth plan," diagram number eighteen, and the "body plan," diagram number nineteen. The "sheer plan" shows the outline of the vessel as it would appear if cut through the middle longitudinally, and viewed from the side of the cut; viewed from above, the cut pieces represent the half-breadth plan. The "body plan" represents the vessel cut crosswise through the midship section, and indicates the outlines of the cross-timbers or ribs. The small scale of the diagrams render them imperfect; some of the lines are incomplete, and several cross-timbers are left out altogether; this has been done purposely to avoid complication. After the following description is understood there will be no difficulty in making a perfect copy if half of the lines were absent. Cross-timber "A" is represented on the diagrams as the "midship section;" the proper midship section, or "dead flat," is the cross-timber marked on diagrams with a capital "O" with a "cross" drawn through it. As the printers have no type to represent the conventional sign for the midship section, this section will hereafter be represented by a capital "O."

In regular drawings the water lines are marked with green ink, the buttock lines with red, and all other lines with black ink. As the lines in the diagrams are all of one color the student may be at first confused by their multiplicity, but a little study will soon give an insight to their meaning. The quickest way to learn drawing is to draw or copy drawings; continue the practice until every point and line, and their meaning, is indelibly fixed in the mind. Commence by drawing a line to represent the base of

HALF BREADTH PLAN No 18.

No 20.

BODY PLAN No 19

the half-breadth plan to any scale. We will suppose one and one-half inches to represent one foot. Perpendicular to the base line draw vertical lines to represent the cross-timbers, one foot apart on the base line. (As the scale we are using is one and one-half inches to a foot, the vertical lines will, of course, be one and one-half inches apart on the drawing). The curved lines representing the water-lines are next copied. Mark on each cross-timber the points

where the water-lines cross them, and connect the points by curving a batten until all the points are touched by it; draw a pencil mark along the outline of the batten, and the line is established. The other lines are copied in the same manner. Leaving this plan for the present, we will next copy part of the sheer plan.

Draw lines to represent the keel, stem and stern post; also a series of vertical lines to represent the cross-timbers; these lines correspond

to the vertical lines in the half-breadth plan, and are drawn at the same distance apart. Next draw the series of horizontal lines in the sheer plan, at distances representing three inches apart. These lines represent the water lines, and correspond to the curved water lines in the half-breadth plan. They are numbered alike on the diagrams. The sheer line or upper curved line in the sheer plan is next drawn. Obtain the points on the cross-timbers by mea-

asuring from the upper line of keel and draw in the curve with a batten. Leaving the sheer plan for the present, we proceed to draw a series of horizontal lines, at distances representing three inches apart, as a base, or ground work, for the body plan. These lines correspond to the water-lines in the half-breadth and sheer plans. Draw two vertical lines perpendicular to the base, to represent the thickness of stem and stern post. Midway between the two vertical lines draw another to represent the half thickness of stem and sternpost. This last mentioned line is a base to measure from. To copy the cross-timbers or ribs, take a pair of dividers and set one of the points on the base line of the half-breadth plan at the intersection of some cross-timber (we will suppose the cross-timber marked A in the diagram), open the other leg of the dividers until the second point will just touch water line No. 1. The measure thus obtained is transferred to the body plan by setting one point of the dividers on the vertical line (representing half thickness of stem and stern post) at the intersection of the water-line No. 1. On the body plan, the other point of the dividers marks the width of that water-line. The measure for water-line No. 2 is obtained by measuring from the same point on the half-breadth plan as before, opening the dividers until the point will touch water line No. 2. The measure thus obtained is transferred to the body plan plan as before, except that it is transferred to water-line No. 2. Transfer the measures of the other water-lines in that manner, in a similar manner. Lastly, measure the height of the sheer line from the keel, on the sheer plan, and transfer it to the body plan. The different points marked on body plan are now joined by a curve, and the outline of cross-timber A is complete. The remaining cross-timbers are all to be copied on the body plan in the manner indicated above.

Many of the points in the curved lines will doubtless be incorrect and refuse to be included in the curve of the batten. No matter, equalize the curve of the batten. The number of points, draw a line along the batten and leave out the obstinate points. Whenever any new points are thus established in the body plan, transfer them to their corresponding places on the half-breadth plan, bend a batten so as to take in the new points with the old, and mark the water-line anew. Adjust and readjust the curves of the water-lines and cross sections until the batten will take in all the different points of any and every line.

At this stage of our drawing we "prove" our work by a series of lines called "butoff lines." On the body plan draw vertical lines (at distances representing four inches apart) on each side of the central vertical line, also draw horizontal lines, at same distance apart on the half-breadth plan. These lines correspond with one another, and are numbered alike on both plans. The buttock lines are shown on the sheer plan in the curved lines. The numbers correspond with the lines on the body and half breadth plans. The measurements to obtain the curves in the sheer plan can be either taken from the body or from the half-breadth plan. The points to be measured are the intersections of the buttock lines with the cross-timbers on the body plan. On the half breadth plan the points are obtained from the intersection of the buttock lines with the water lines. We will suppose that the measurements for the buttock line No. 4 is desired. Taking the measurements from the body plan, we proceed in the following manner: Set one point of the dividers on the horizontal base line of the body plan at the place where the vertical buttock line No. 4 intersects it, open the dividers until its other point touches the intersection of the buttock line with any cross-timber or rib; transfer the measure thus obtained to the corresponding cross-timber on the sheer plan, measuring from the line of the cross-timber. The measurements of all the cross-timbers intersected by buttock line No. 4 on the body plan, are transferred to the corresponding cross-timbers on the sheer plan in a similar manner. After all the different points are marked on the sheer plan a batten is bent to them, and, if everything is "fair," all the points will be touched by the curve of the batten. Any "unfairness" or irregularity must be equalized between the several plans until all the curves are true. If the measures are taken off the half-breadth plan the intersections of the buttock lines with the water lines are the points to measure. Transfer the distance of the intersection from the nearest cross-timber to the corresponding water line on the sheer plan. By using both body and half-breadth plans to measure from we have a double "proof" or "check." The lines given in the diagrams are for a rowing boat, commonly named the "Whitehall boat." The dotted line in the sheer plan is the rabbit line for stern deadwood.

## THE FLYING PROA.

W. L. JARVIS, of Ithaca, the well-known canoe-builder, has launched from his shop a unique craft of the "Flying Proa" model, similar to one described in *Harper's Monthly* for August, '77. The Proa is 16ft. 4in. long over all, with a keel of 16ft. and a breadth of 8ft., carrying a lateen sail 28 by 20 by 18 ft. The plan of her construction is as follows: Two separate hulls, 16ft. long, 18in. wide, (amidships) and 18in. deep, are connected fore and aft by supports 5ft. in length, on which is secured the flooring of the craft. One mast is stepped well forward, and is rigged with a lateen sail of the size given above. The boom swings free of the deck such a distance that a man working her finds no difficulty in standing on her deck. The sides of the hulls facing each other are perfectly straight, while the outer sides are curved. The craft makes very good time in all sorts of weather, but in a light breeze especially she shows her superiority to a common sailing yacht. Mr. Jarvis thinks that with a mainsail and jib she would prove more tractable than with the lateen, as with the latter she shows some indisposition to come about when beating against

the wind. A much larger sail than the one used would undoubtedly be an improvement, it being quite impossible to swamp the Proa. The price paid Mr. Jarvis, we believe, for the craft just finished approaches \$200. The Proa is undoubtedly a success, and Mr. Jarvis contemplates building another, with a length of 30ft., and rigged in proportion, the qualities of which he thinks will be superior to those of the one just finished.

**SAIL FOR A CAT BOAT—New York, Oct. 26.**—*Mr. Editor*—We would like to have the opinion of those more experienced than ourselves as to the proper size and shape of a sail for an 18 feet cat-boat.

It seems to me that the whole question of shape for a cat-boat's sail is not appreciated as much as it should be by those who own and sail this class of boats. A good many seem to have the impression that a boat should have an enormous amount of canvas on the boom to make her sail well. Now, this we contend is a mistaken idea; and indeed it has, to our mind, been proven so. A well-modelled boat, with poorly shaped sail, has been beaten by a poorly modelled boat with a well shaped sail. In fact, the whole question as to size and shape of sails is a very important one, fully as much so as the model of the boat. According to our ideas, a cat-boat's sail should have a good deal more hoist and less boom out-board than as at present rigged in this vicinity. But let us hear from those who know more about the matter than perhaps does.

By the way, where are those other articles on boat building, etc., we were promised?

Tom.

**Newbury, Oct. 27.**—The four and one-quarter miles straight away race, in working boats, between Arthur Maguire, Jr., and Albert Derragh, of Newbury, against Ellis and Daniel Ward, resulted in a victory for the Wards, who crossed the line in 28m 42s.

**NEW JERSEY—Viking Boat Club.**—In the closing regatta of this club, last Saturday, the single-scutt race for the champion club badge was retained by C. H. R. Halsey, who had held it the previous year. The second, for pair-oared gigs, between S. S. Wandel, B. Darrach, J. O. Elliott, coxswain, and P. B. Howell, H. F. Morewood and L. W. Kingsley, coxswain, was won by the former crew. The four-oared barge race, between the Vikings and Dreadnaughts, was won by the former.

**HARVARD COLLEGE REGATTA.**—The fall races of Harvard on the Charles consisted of two races. Six-oared boats, two miles with a turn, for the graduate's cup and silver goblets to each of the winning crews. The crews were made up by entries from Holworthy, Matthews and Holyoke, Halls, the Holyworthy representative, winning in 13m 39s. The four-oared race, same distance, for pointer cups, was won by a crew from Wild Hall in 14m 23s. Their competitors were entered from Matthews Hall.

**DAUNTLESS AND WANDERER.**—These two yachts of the N. Y. M. Y. C. sailed a closely contested race, three miles to windward and return, at Gravesend Bay, L. I., last Monday. The time was—Wanderer, 1h 56m; Dauntless, 2h 5m.

**HARVARD AND YALE.**—The differences which promised to preclude any regatta between these two colleges were amicably adjusted at a meeting in Springfield last Thursday, between Captains Thompson of Yale, and Bancroft, of Harvard. The charge made by Yale that in the last race the referee, Prof. Agassiz, had changed Harvard's course, and so given her an advantage, was satisfactorily answered by a letter from the professor, explaining that such change was made necessary by the presence of eel grass in the course originally marked out. He also said that he had caused the removal of a snag at Agawam ferry for the benefit of Yale, a circumstance which had previously been unknown to Captain Thompson. The waving of the red flag—the bloody shirt—was claimed to be necessary signals to the pilot of the referee's boat. The colleagues thereupon came to the eminently sensible conclusion that there was no necessity for further ill-feeling, and decided to have a regatta. This will probably be rowed on the New London course, and we hope Columbia may participate.

**SIX HUNDRED MILES IN A CANOE.**—The *Davenport* (La.) *Democrat* records the arrival at Muscatine of Mr. W. W. Cook, who had started out from the Ojibway Indian reservation at Crow Wing, following the Crow Wing two hundred and fifty miles to its confluence with the Mississippi, and then three hundred and fifty miles on that river. The time occupied was twenty-two days.

## National Pastimes.

**THE PARADE OF THE COACHING CLUB.**—Though no sun shone to flash from the brilliant trappings, nor gleams came from the sleek hides of the splendid beasts which clamped on their bits, the parade of the Coaching Club on Saturday was one of the leading events of the great city. Around Madison Square were stationed the coaches, and many thousands of people witnessed the gathering and the start of this handsome pageant. By about 3:30 the line was formed, and without blast of horn, but with the cheering of the lookers-on, the start was made. The order of procession was as follows:

First Coach—Col. William Jay, President of the Coaching Club. Colors, canary and red; horses, a chestnut and three bays, each about 15 hands 3 inches high. Passengers—Col. William Jay, Mr. Schieffelin, Mr. Schieffelin, Miss May, Miss Maud Rives, and Mr. John W. Balfour.

Second Coach—Mr. Perry Belmont. Colors, blue and red; horses, four dark bays, 16 hands high. Passengers—Mr. Perry Belmont, Mrs. Mahlon Sands, Mr. Mahlon Sands, and Mr. and Mrs. T. Cushing.

Third Coach—Mr. F. Bronson. Colors, blue and red; horses, chestnut and brown in the lead, 16 hands high; and two bays, 15 hands 3 inches,

on the wheel. Passengers—Mr. F. Bronson, Secretary of the Coaching Club; Mrs. F. Bronson, Mr. and Mrs. Adrian Iselin, Jr., and Mr. Edgerton Winthrop.

Fourth Coach—Mr. Hugo Fritsch. Colors, black and Austrian yellow; horses, two roans on the wheel and two chestnuts in the lead, each about 15 hands 2 inches high. Passengers—Mr. Hugo Fritsch, Miss Gilbert, and Mr. and Mrs. Duer.

Fifth Coach—Mr. Theodore Havemeyer. Colors, blue and black; horses, four brown, with black points, each about 15 hands 1 inch high. Passengers—Mr. Theodore Havemeyer and Mrs. Havemeyer, Mr. Winthrop Thorne, Miss De Luce and Mr. Thuckor.

Sixth Coach—Mr. Leonard Jerome. Colors, blue and yellow; horses, four bays, each about 15 hands 3 inches high. Passengers—Mr. Leonard Jerome, Miss Townsend, Mr. Wright Sanford, Mrs. James, Mr. Hutton and Mr. Mesler.

Seventh Coach—Mr. Pierre Lorillard. Colors, green, picked with yellow; horses, four bays, each sixteen hands high. Passengers—Mr. Pierre Lorillard and Mrs. Lorillard; Miss Taylor and Mr. and Mrs. Van Rensselaer Croger.

Eighth Coach—Col. De Lancy Kane. Color, primrose; horses, skewball and piebald in the lead and gray and chestnut on the wheel, each about 15 hands high. Passengers—Mr. De Lancy Kane, Vice-President of the Coaching Club; Mr. F. Sherman, Mr. G. P. Wetmore, Dr. Pike, of Yonkers, and Mr. J. J. Kane.

For the occasion, Col. Kane's coach, the Tally-ho, had undergone a change, and, shaking off the dust of the Yonkers trip, had put on a holiday appearance. As the coaches proceeded up the avenue, at nearly every window were seen handsomely dressed ladies, who smiled pleasantly on the cortege. The Fifty-ninth-street entrance of the Park was reached in about a quarter of an hour. At the lake a short halt was made. Such was the desire on the part of those who were riding in the Park to see the procession that progress for a time was somewhat impeded.

Most St. Vincent was reached in good time, and on the return the Hotel Brunswick was passed at about 4:15. From here the Union Club was the next point to be gained. The route was continued down to Washington Square, and in the upper end of the square an abrupt turn was made, the coaches returning up Fifth Avenue to Twenty-third street, through Twenty-third street to Madison Avenue, up Madison Avenue to Twenty-sixth street, and thence into Twenty-sixth street, with the horses facing Fifth Avenue, the coaches drew up to the north side of the street, the passengers alighted, a horn sounded, and in five minutes not a coach was to be seen. Alas! the cheery sound of the horn will be heard no more for a season. It will be on the last Saturday in May, 1878, that the club will meet again.

**SCOTTISH-AMERICAN ATHLETIC CLUB.**—The winners in the games at the Mott Haven meeting held on Saturday were as follows: One Hundred Yards Dash—F. C. Saportas, first heat; J. B. Elliott, second heat; J. F. Danfield, of Princeton College, third heat; Saportas, final heat, 11½s. One-mile walk—T. H. Armstrong, Jr., 6m 44½s; W. H. Griffen, 2m 15½s. Putting the Shot—A. W. Adams, 37ft 3½in. Two Hundred and Twenty Yards Run—A. W. Anderson won final heat in 24½s. Two Miles Walk—W. Boland, 18m 4½s. Running Long Jump—W. T. L. Johnson, 18ft 6in. Four Hundred and Forty-four Yards Dash—Final heat won by W. G. Sapper, 57s. One Hundred Walk—T. H. Armstrong, Sr., 5½ miles. Throwing the Hammer—G. D. Parmlay, 50ft 6in. Mile Run—E. Merrit, 4m 43½s.

**COLUMBIA COLLEGE GAMES.**—The eleventh biennial games of Columbia College were held at Mott Haven last Saturday. The various contests were won as follows: One-mile Walk—C. Eldridge, 7m 6m 4-5s; Running High Jump—J. P. Conover, 80, 5ft 3in; Half-mile Run—A. walk-over for R. R. Volgate, 80, 2m 15½s; Pole Vaulting—J. W. Prior, 78, 7½ ft; One Hundred Yards Dash—W. Waller, 78, 10½s; Throwing the Sixteen-pound Hammer—H. G. Ridaback, 79, 69ft 2in; Four Hundred and Forty-four Yards Dash—W. B. Stewart, 80, 57-2-5s; Two Miles Walk—C. Eldridge, 15m 44-3-5s; Running Broad Jump—J. P. Conover, 18ft 4in; Hurdle Race, 120 yards—J. P. Conover; One-mile Run—W. S. Beames, 78, 5m 16s; Strangers' Race, one-half mile—Griffin, of the S. A. C., 2m 13-5-5s; Steeple Chase, one-half mile—Stewart, 3m 55; Ung of War—Seniors vs Juniors, won by Juniors; Sophomores vs Freshmen, won by Sophomores. Final pull won by Juniors.

**YALE COLLEGE GAMES.**—The fall athletic games of Yale came off Oct. 24th. The 100-yard dash was won by Brown, of the Scientific School, in 10½s; high jump, by Capt. Thompson, of the University crew, at 5ft 2in; throwing base ball, Hutchinson, of class '80, 34ft 5½in; half-mile run, Brooke, of '79, in 2-13-4; two-mile walk was won by Cleveland, of the Scientific School, in 18:16; "ing of war," won by '78 against '79 (Scientifics), 80 and '81; 440 yards dash, by Brown, Scientific, in 5½s; throwing hammer, by Capt. Thompson, 69ft 7½in.

**TUFT'S COLLEGE ATHLETIC SPORTS.**—In the semi-annual athletics of the Tufts College boys last week the winners were: One Hundred Yards Dash—Fales, 79, 11½s. Mile Run—Wells, 79, 5m 23½s. Quarter-mile run—Fales, 1m 1½s. Half-mile run—Friend, 80, 2m 15s. Mile walk—Prescho, 81, 5m 23½s. Three-legged race, one hundred yards—Fales and Munroe, 79, 16s. Kicking football—Perry, 79, 145ft. Running long jump—Eaton, 80, 16ft 8in. Throwing base ball—Donovan, 80, 27ft. Running high jump—Perry, 79, 4ft 5in.

**COLLEGE OF THE CITY OF NEW YORK.**—The tournament for the "ing-of-war" championship was begun last Saturday, and will be concluded next Saturday. The contests thus far have been as follows: Sophomores vs Freshmen, won by Freshmen in 2m 15s; Seniors vs Juniors, won by Seniors in 1m 20s; Juniors vs Sophomores, won by Juniors in 2m 1s; Seniors vs Freshmen, won by Seniors in 1m 9s.

**NEW YORK ATHLETIC CLUB.**—The closing handicap games of this club will come off Nov. 6, at Mott Haven.

## New Publications.

**PEN AND INK SKETCHES OF LABRADOR SCENERY.**—Some seventeen years ago, in 1860, the editor of this paper, then one of the proprietors of the *New York Journal of Commerce*, made a summer cruise to the coast of Labrador, in company with Dr. Elliott Coues, of the Smithsonian Institution, and fifteen others, in quest of health, pleasure, and natural history specimens, the events of which were duly recorded at the time in an article of considerable length, published in *Harper's Magazine* for April and May, 1861. The cruise occupied considerably over three months, and the article was profusely illustrated from photographs and drawings taken on the spot. Since then similar excursions to the same locality, by sailing vessels and steamers, have been tolerably frequent, so that the routes and rude fishing stations along the barren coast have become somewhat familiar. One of these excursions was made last summer, and the fortunate presence among the number of tourists of Mr. Wm. E. Gladwin, of Worcester, Mass., has secured to us a series of additional sketches whose accuracy we can vouch for from our own observations and acquaintance with the places outlined. These have been neatly done in pen and ink, and duplicated by the heliotype process into an edition of some 200 volumes, which being appropriately bound and embellished, constitute an interesting souvenir for private distribution as well as a valuable addition to the geography of North America.

These faithful transcripts show the entire belt of islands which lie along the Labrador coast in a nearly uniform breadth of about twelve miles, to be little else than bare granite, upon which even the coarsest grass can scarcely find nourishment and growth. Some twenty passages, or "tickles," behind these islands afford constant shelter for the summer fishing fleet, which cannot depend upon fair weather, even in the most favorable season, for two consecutive days; while the fishing "stages," or stations, and an occasional hut constitute almost the only evidences of human life and habitation. In one instance the author has given us a sketch of a Hudson Bay Company's port, situated in a bay extending well into the interior of the mainland, which shows a considerable growth of pine and a cheerful little settlement. There are many salient points along the coast, however, which he has omitted, some of which are the most interesting and picturesque geological formations to be found there—notably the twin cattle rocks of basalt at Henley Harbor, near the eastern entrance of Belle Isle Strait and Belle Isle itself, with its lone lighthouse standing guard, perched upon a cliff three hundred feet above the waves, whose height can only be reached by hanging ladders in days of stillest calm.

A trip to Labrador in a steamer will always be one of interest. In a sailing vessel it is apt to be long and tedious, and therefore monotonous.

**Tiffany & Co., Silversmiths, Jewelers, and Importers,** have always a large stock of silver articles for prizes for shooting, yachting, racing and other sports, and on request they prepare special designs for similar purposes. Their Timing Watches are guaranteed for accuracy, and are now very generally used for sporting and scientific requirements. **TIFFANY & CO.** are also the agents in America for Messrs. **PATEK, PHILIPPE & Co.,** of Geneva, of whose celebrated watches they have a full line. Their stock of Diamonds and other Precious Stones, General Jewelry, Artistic Bronzes and Pottery, Electro-Plate and Sterling Silverware for Household use, fine Stationery and Bric-a-brac, is the largest in the world, and the public are invited to visit their establishment without feeling the slightest obligation to purchase. Union Square, New York.

Brooklyn.

## WHAT PRAIRIE OIL IS BEING USED FOR.

MR. KENWARD PHILIP, late Dramatic Editor *Brooklyn Eagle*, Brooklyn, N. Y., was unable to walk with-  
out the aid of crutches, owing to a severe attack of rheumatism. After the third application of PRAIRIE  
Oil the crutches were thrown aside, he having no further use for them.

Says the Proprietor of Niblo's Garden, New York: "PRAIRIE Oil gave me relief from inflammatory  
rheumatism after first application; and after the third I had no further use for my cane."

PHILIP ROUSE, Esq., ex-Building Inspector, DeKalb avenue and Fort Greene Place, Brooklyn, says: "For  
acute or inflammatory rheumatism it is a wonderful remedy; has been in use in my family for over a year."

M. C. EDEY, Esq., the well-known chemist, 319 Court street, Brooklyn, manufacturer of Eley's Carbolie  
Troches, etc., says: "I find PRAIRIE Oil to be a most wonderful preparation in cases of rheumatism, hav-  
ing seen it tested in a case of years' standing. The patient obtained relief at once, and was ultimately  
cured."

MR. JOHN H. SNEDEKER, of Telfair & Snediker, oil merchants, 105 John street, New York, was cured of  
Pleurisy by the use of PRAIRIE Oil.

MR. G. PADDON, tobacco merchant, 992 Fulton street, Brooklyn, lost the use of his right leg by Sciatica,  
got relief at once after first application of PRAIRIE Oil. This gentleman had become so depressed by his  
affliction that he had given up all hopes of recovery.

CAPT. JOSEPH LA FIURA, Merchant Court, near Remsen street, Brooklyn, was cured of a stiff joint, of  
years standing, after a few applications of PRAIRIE Oil.

MR. BERTSON, publisher, 16 Beekman street, New York, says: "I find PRAIRIE Oil to be infallible in  
many serious complaints."

PRIOE FIFTY CENTS AND ONE DOLLAR PER BOTTLE.

Ask your Druggist for it.

P. O. Box 2997. "THE PRAIRIE OIL CO.," 182 Nassau St., N. Y.

S. Box 77, Station D, New York. Nov1 2t

## NEW YORK SHOOTING COAT.

A stylish, handsome Coat. First-class in every particular. Pleasant to wear, durable, and in the  
end the cheapest.

## MADE OF BROWN VELVETEEN.

Pockets and lining made to take out, so that it may be worn for early fall and winter shooting. (Horace  
Smith, Esq., says: "It is my idea of a shooting coat. I have worn them for several years, and would  
have none other.") Price for Coat, \$25; Vest, \$6.50. Also the best brown corduroy pants at \$10 per pair.  
I make only the one grade, as the cheapest goods do not turn briars and will not give satisfaction.

Also, in addition to the above, I am making a Waterproof Canvas Suit, cut same style as the  
Velveteen; goods, not stiff and hard, but soft and pleasant to wear; guaranteed to turn water. Sportsmen  
who have seen it say it is The Best Yet. Coat, \$6.50. For full Suit, \$14.00. I also make the Sleeveless  
Coat; Vest with sleeves if desired. Rules for measurement and samples sent upon application.

F. L. Sheldon,

RAHWAY, N. J.

For Sale in New York by

H. C. SQUIRES, 1 Cortlandt St., N. Y.,

ESTABLISHED IN 1887.

Consult your interest by sending for our revised and reduced prices.

**Excelsior**  
LATEST IMPROVEMENT.  
Double Treadle, including one doz.  
Saws, thirty inimitable Pict Sawing  
Feathers and prepared Wood, to the  
value of \$4. A new device for tight-  
ening Saws, and Drilling attachment.  
Wrench, Oil Cup and Screw Driver.  
Speed, 800 strokes per minute. Saws,  
21-inch thick. Price, complete, cases  
and delivered on board cars or at Ex-  
press office, \$12.  
Saw only, without attachments, \$9.

**SMALL STEAM-ENGINES.**  
With Copper Boiler, to drive light  
Lathes, Scroll Saws, etc. Are all sizes  
from 1½ up to 2 horse power; either  
plain castings, partly finished, or com-  
plete, ready for use.  
The "Scientific American" of June 10,  
1875, says of the above, in an extended  
article, introducing our manufactures  
to the public: "It can turn wing-  
s, churns, washing machines, or ice cream  
freezers, run coffee mills, pump water  
through a house, actuate foot lathes,  
scroll saws or light boxing machinery,  
run knitting or sewing machines, turn  
a griststone or emery wheel, work ven-  
tilating or hand threshing machine con-  
tainers, meat or feed choppers, or sausage  
machines, drive small blowers for pneu-  
matic dispatch tubes in a building, or for  
a which it can be applied."  
Also Engines and Boilers capable of propul-  
sing 15 to 18 tons. The boats have keel, stem,  
with rudder and tiller, row lock and con-  
s. Those wishing a pleasure boat will find

**NEARLY ONE THOUSAND IN USE.**  
Buffalo Pony Planer. Will cut it  
self and, pay expense of running in 8  
days. Price from \$50 and upwards,  
each.

**LIGHT MACHINES FOR PONY**  
OK HORSE POWER.  
The great success of these machines  
is unprecedented, and it may be con-  
fidently affirmed that no article has  
ever more clearly proved its superi-  
ority for the quantity and quality of  
its work than this. It is made in  
several sizes, and can be fitted up  
to those above mentioned.

**Buffalo Excelsior Pony Planer and Matcher.**  
Patented March 30, 1875.  
Best of its kind in use.  
Price, complete, \$75.  
Also Planing Machine  
Knives, which are recom-  
mended as superior and  
extra in quality.

ling boats from 18 to 28 feet long, 4 to 5½ feet beam, with draft of water  
stem and rudder post of oak, pine planking, copper fastened throughout, fitted  
with all around the boat, lockers and coal bunkers, and have two coats of paint.  
These the safest and fastest, as they can be made to attain a speed of from 6 to  
16 miles per hour.  
They are adapted to  
great variety of uses,  
such as Excursion,  
Shooting, Fishing or  
Pic-Nic Parties, for  
travelers, voyagers,  
botanists and tourists,  
and especially owing  
to their light draft of

water for exploring expeditions and surveying parties. The Engine and Boiler can be easily detached from the boat, and is then  
available for Agricultural, Mechanical, Commercial or Domestic requirements or for the use of Amateurs, when power is needed  
for running light machinery.  
Price of 20 foot boat, complete,  
Price of Engine and Boiler, without boat, including driving pulley, \$125.00  
275.00

## Gunpowder.

## Warren Powder Mills,

MANUFACTURERS OF  
BLASTING AND MINING, SHIPPING AND  
SPORTING GUNPOWDER.

SPORTING BRANDS—Eureka, Continental, "Border Rifle," Snap-Shot, and Warren Sporting Cannon and Musket, U. S. Standard. The above can be had of the dealers, or at wholesale at the office, 27 Doane street, Boston, Mass., and of the agents, JOHN P. LOVELL & SONS, corner of Washington, Cornhill and Brattle street, Boston, Mass. 3719

THE  
HAZARD POWDER CO.  
MANUFACTURERS OF  
GUNPOWDER.

## Hazard's "Electric Powder."

Nos. 1 (fine) to 6 (coarse). Unsurpassed in point of strength and cleanliness. Packed in square canisters of 1 lb. only.

## Hazard's "American Sporting."

Nos. 1 (fine) to 3 (coarse). In 1 lb. canisters and 6 1/2 lb. kegs. A fine grain, quick and clean, for upland prairie shooting. Well adapted to shot-guns.

## Hazard's "Duck Shooting."

Nos. 1 (fine) to 5 (coarse). In 1 and 5 1/2 lb. canisters and 12 1/2 lb. kegs. Burns slowly and very clean, shooting remarkably close and with great penetration. For field, forest or water shooting, it ranks any other brand, and it is equally serviceable for muzzle or breech-loaders.

## Hazard's "Kentucky Rifle."

FFFG, FFG, and "Sea Shooting," FG, in kegs of 25, 12 1/2, and 6 1/2 lbs. and cans of 5 lbs. FFG is also packed in 1 and 5 1/2 lb. canisters. Burns strong and moist. The FFG and FFG are favorite brands for ordinary sporting, and the "Sea Shooting" FG is the standard Rifle powder of the country.

## Superior Mining and Blasting Powder.

GOVERNMENT CANNON & MUSKET POWDER; ALSO, SPECIAL GRADES FOR EXPORT OF FACTURED TO ORDER.

The above can be had of dealers, or of the Company's Agents in every prominent city, or wholesale at our office,  
33 WALL STREET, NEW YORK.

THE  
New Dittmar Powder.

THE CHAMPION POWDER OF THE WORLD  
For all off-hand shooting at short and long ranges. Unsurpassed for Cleanliness. Pleasant to shoot on account of little recoil and report. Desirable for hunting on account of little or no smoke. Unequalled for rapid firing, as it does not foul and keeps up the barrel as black powder. Great accuracy, penetration and good pattern. Safer than black powder. Address

## Sportsmen's Goods.

## BOSTON

## SHOOTING SUIT.

Manufactured only by

G. W. SIMMONS & SON,

BOSTON.

Flexible, Waterproof, Tan-Color, Duck.

Each article—coat, trousers, vest and hat—have the name and manufacturer's address stamped upon it, and no suit is genuine without it bears this imprint.

The suit can be sent, securely packed, by mail to any part of the United States or Canada on receipt of \$1.25 above the price of the suit.

We make no discount except to the trade. We make but one quality, and that is the VERY BEST. The price of the suit complete is \$13.

The suit consists of coat, trousers, vest and choice of either cap with havelock, or hat.

The material is of the best quality of duck, waterproofed by a patent process. The color is that known as "dead grass shade."

The seams and pocket corners are riveted, and nothing is neglected to make the whole suit complete in every way.

## OUR HUNTING SHOES,

which are considered the best in use, are also sent by mail at an advance of 25 cents above the price \$5.50 per pair. These shoes are made to our special order to match our suits, and the design of the whole embraces the best points of the English and French equipments, combined with all necessary requirements for American service.

## THE SOLA TOPEE.

AN EAST INDIAN SHOOTING HAT, Helmet. Shaped. Ventilated. Of same Water-Proofed Material. PRICE, \$2.50. Those who prefer this to the ordinary hat or cap, can have the same sent with "The Boston Shooting Suit" at an added cost only of \$1.00.

Such a popularity as the "Boston Shooting Suit" enjoys, has never been attained by any other similar garment in this country. It is in constant demand from all parts of America, and orders have been filled for Canada and England.

"Shipping clothing to England strikes us very much like sending 'coals to Newcastle,' but the merits of the BOSTON SHOOTING SUITS have been heard of in the Old Country, and that land of sportsmen has, in addition to Messrs. Simmons & Son, which will doubtless be followed by many others."—Boston Paper.

The author of "Tales of the Adirondacks," the Rev. W. H. Murray, one of our most enthusiastic sportsmen, says of it:

"We were shown the other day a new waterproof suit, specially adapted for sportsmen, designed and made up by Simmons & Son, of Boston, and to which we call the attention of all brethren of the out-door and shore-shooting fraternity, because it meets the demand of personal comfort and convenience beyond anything of home manufacture seen by us before. As a sportsman, we give it our unqualified endorsement, as combining the best points of the English suit, and in addition suitably adapted to the necessities of the American service. It is a most admirable and satisfactory contrivance in color, style, waterproof quality and capacity. The coat is a marvel in this latter respect."

## THE FOREST AND STREAM SAYS:

"THE BOSTON SHOOTING SUIT.—One of the most successful manufacturers of waterproof shooting suits is the firm of G. W. Simmons & Son, Oak Hall, Boston. We had one of their suits on duty at Hunter's Camp, at Philadelphia Centennial Exhibition. It has grown gray in service, but is good for use yet. This suit is known as the "Boston Shooting Suit," in contradistinction no doubt, from the garments which are manufactured out West and at Washington, each of which has a local demand of its own.

A letter from San Francisco, Cal., says:

G. W. Simmons & Son:

GENTLEMEN—I have this day received the "Boston Shooting Suits" ordered from you on the 16th. My object in writing is simply to say that they came to hand by mail in perfect order, and I am not more than satisfied with each article. They are all, if not more, than represented in your advertisement in FOREST AND STREAM. They supply a want long felt here, and we have no doubt many will be ordered. I am obliged to you for sending by mail and thereby saving me several dollars. Enclosed please find the money to repay you for postage. Yours very truly,

## [DIRECTIONS FOR MEASUREMENT.

Around the breast. Inside seam of pantaloons.  
Around the waist. Size of head.  
Inside of seam or coat. Mention height and weight sleeve.

Price of Suit complete, with choice of hat or cap, \$13  
Note again, the coat and vest are all double-seamed, each pocket being riveted at corners with copper rivets. French hunting buttons on coat and vest. Each button-hole made of leather. The whole suit as described above is made of 10-oz. army duck, waterproofed by a patent process, and colored to the shade of dead grass. Each suit distinctly marked.

For those who prefer, we make a hunter's coat, with sleeves attached to the vest. We make but one grade of suit, and that is the very best in every particular.

An illustrated circular, containing full description of each garment, with sample of the material from which made, will be sent free on application.

Address

G. W. SIMMONS & SON,

Oak Hall, Boston, Mass.

## Sportsmen's Goods.

THE  
**Sportsman's Gazetteer**  
AND  
**GENERAL GUIDE,**  
WITH MAPS AND ILLUSTRATIONS.

896 pp., Price \$3.

Tinted Paper, 1/2 bound Morocco, \$5; Tinted Paper, Muslin, \$4.

BY CHARLES HALLOCK,

EDITOR OF "FOREST AND STREAM," AUTHOR OF THE  
"FISHING TOURIST," "CAMP LIFE IN FLORIDA," ETC.

NEW YORK:

"FOREST AND STREAM" PUBLISHING CO.

Sent by mail post paid on receipt of price.

This book is a complete encyclopedia for sportsmen. It gives every sportsmanlike method for capturing every known game animal, bird and fish in North America. It designates the proper charges for guns for each kind of game, the various kinds of decoys and blinds, and baits and tackle for the fish. It gives over 4,000 localities where game and fish may be found, specifies the game found in each locality, the hotel accommodation, and the best route to get there. It describes 27 varieties of edible fish alone, that may be taken with the hook; 20 varieties of ducks; 50 varieties of snipe or waders, and the different methods of shooting each. Every kind of dog used for sport is designated, and his points for bench judgments fully given. It is in itself the most concise, accurate, instructive, sensible and comprehensive work ever written upon the dog and his diseases. Any person can administer the prescriptions with perfect confidence in their safety and efficiency. It contains very useful recipes and remedies for wounds, bites, poisons, illness and emergencies of all kinds; for cleaning, re-training and preventing every implement used for sport; for selection and use of every kind of boat employed by sportsmen, and a directory where to buy outfitting goods. It instructs in Taxidermy, and tells how to preserve and mount specimens of animals, birds and fish.

## INDORSEMENTS.

**SPORTSMAN'S GAZETTEER**—Geo. Bird Grinnell, of the Peabody Academy of Science, New Haven, Conn., "I have to thank you for a copy of the Sportsman's Gazetteer received day before yesterday. I have delighted acknowledging it, in order that I might be able to speak intelligently of its merits. I have looked it over somewhat carefully, and I must say that I am delighted with it. It seems to be just the book that we have so long wanted in this country—an American 'Stonehenge' in fact. On the fishes you have surpassed yourself, and I am astonished at the amount of material you have collected, and the happy method in which you have treated the group. The Dog and Diseases of the Dog are admirably written, and will prove one of the most useful of manuals for sportsmen. The Art of Fly-Fishing, and the hints and hints are all that could be desired; in fact the book seems to be a complete success. I do not see how it can fail to have a very large sale."

**THE SPORTSMAN'S GAZETTEER**—The Gazetteer duly came to hand, and to say that I am delighted with the book only faintly expresses my appreciation of it. How you have been able to gather so much valuable matter together is almost a mystery to me. It certainly speaks well for your industry and knowledge of the subjects discussed. For the size and valuable information contained therein, I think, is remarkably low, and I would not be without it for double the price. Every sportsman and everybody interested in sporting matters should have a copy, and I shall take great pleasure in recommending it to my army friends and to my acquaintances.

H. C. YARROW, M. D., U. S. A.

**THE GAZETTEER**—The Sportsman's Gazetteer was duly received, and myself and many of our best judges in sporting literature have critically examined the book, and all unite in pronouncing it the most valuable work ever issued from the press on kindred subjects. It is a wonder that all those who value information should be so intelligently crowded into a book of its size. The task must have been very great, but has been accomplished in a remarkable manner, intelligent and pleasing manner. Every page demonstrates the fact that the author was a master of his subject. No sportsman or tourist can afford to be without the book, and it ought to be, and no doubt will be, read generally by the masses, and certainly by all interested in the study of natural history.

Dr. D. C. ESTES.

Lake City, Minn., Aug. 1, 1877.

## Fur, Fin & Feather

CONTAINS THE

**GAME LAWS** of all the States and the  
Canadian Provinces and a List of  
Hunting and Fishing Grounds,

Besides, a **Vast Fund of**  
**VALUABLE INFORMATION** FOR ALL  
**WHO EITHER SHOOT OR FISH.**

It tells you everything you want to know about  
Hunting and Fishing, Where to go, How to get there,  
What Kind of Game and Fish you will find, What  
Kind of Shooting and Fishing Tackle to use, Ammu-  
nition, Bait, &c., and is responsible to all who  
use either Gun or Rod; It is in fact a complete  
**HUNTING AND FISHING DIRECTORY,**  
and no matter how much or how little attention  
you take in the woods or along the stream you  
will find *Fur, Fin, and Feather* worth many times  
its cost to you.

Each number consists of 176 to 192 large octavo  
pages, and in addition to the foregoing contain  
numerous interesting sketches of Camp Life and  
Sporting Adventure that renders the work enter-  
taining and instructive reading for every household.  
Not an objectionable word appears in its pages.

## CHICAGO &amp; ALTON RAILROAD.

## THE ONLY DIRECT RAILROAD from

Chicago to St. Louis, and Chicago

to Kansas City,

WITHOUT CHANGE OF CARS.

FIRST-CLASS ACCOMMODATIONS IN  
EVERYTHING.

**SPORTSMEN** will find splendid shooting on the  
line of this road; prairie chicken, geese, ducks, brant,  
quail, etc. Connects direct at Kansas City with the  
Kansas Pacific Railroad for the great Buffalo and An-  
telope range of Kansas and Colorado.

Liberal arrangements for transport of Dogs for  
Sportsmen.

JAMES CHARLTON,

General Passenger Agent,  
Chicago, Ill.

## TROUT FISHING!

## The Wisconsin Central Railroad

THROUGH TO

## LAKE SUPERIOR.

EXCURSION TICKETS from Chicago to Ashland  
and return for \$20 are sold at 63 Clark street, or the  
C. M. & St. Paul, Madison Street Depot, Chicago;  
also at low rates from Milwaukee. Dogs, guns and  
camp equipment taken free.

The points of attraction to sportsmen on this  
"Forest and Stream" route are Menasha (Doty  
Island) for bass fishing; Butternut Creek and Lake  
for muscalonge; the many branches and lake a bass  
of the Flambeau and Chippewa which team with bass,  
pike and pickerel, never till this season fished by  
sportsmen. Between Silver Creek and Ashland all are  
trout streams, and many others can be easily  
reached along the shore from Ashland or Bayfield,  
while rock fishing and trolling in the Bay affords ex-  
cellent sport.

The new hotel at Ashland, the "Chequamegon,"  
was built in July. A fine time there is accom-  
modation at the smaller houses.  
Steamers from Ashland to all Lake Ports.

## St. Paul and St. Louis Short Line.

Burlington, C. Rapids &amp; N'rt'n

Railway.

## QUICKEST, CHEAPEST AND BEST!

TWO PASSENGER TRAINS EACH WAY DAILY,  
crossing and connecting with all East and West  
Lines in Iowa, running through some of the finest  
hunting grounds in the Northwest for Geese, Ducks,  
Pheasants and Ruffed Grouse and Quail. Sportsmen  
and their dogs taken good care of. Reduced rates  
on parties of ten or more upon application to General  
Ticket Office, Cedar Rapids. C. J. IVES,  
E. E. WISLAW, Gen. Passenger Agent,  
General Manager.

## Sportsmen's Routes.

## THE "FISHING LINE."

## Brook Trout, Grayling and Black Bass Fisheries

OF NORTHERN MICHIGAN, VIA

## Grand Rapids and Indiana Railroad.

(Mackinaw, Grand Rapids & Cincinnati Short Line.)  
Sportsmen who have cast a fly or trolled a spin on  
the waters of the Grand Traverse Region will  
come again without solicitation. All other lovers  
of the Rod are invited to try these waters, where  
The fish named above, as also Muscalonge,  
Pike and Pickerel, abound.

In no other streams east of the Rocky Mountains  
is the famous American Grayling found in such  
numbers.

Brook Trout Season opens May 1st.

Grayling Season opens June 1st.  
The sportsman can reduce his trophies of his  
skill to his friends or "Club" at home, as ice for  
packing fish can be had at many points.

Take your family with you. The scenery of  
the North Woods and lakes is ever beautiful. The  
air is pure, dry, and bracing. The climate peculiarly  
beneficial to those suffering with hay fever and  
asthma.

The Hotel Accommodations, while plain, are,  
as a rule, good, far surpassing the average in coun-  
tries new enough to afford the finest of fishing.

On and after June 1st Round Trip Excursion  
Tickets sold to Point in Grand Traverse  
Region, and thence to train facilities offered to  
tourists and sportsmen also, on and after July 1.

Mackinaw and Lake Superior Excursion Tick-  
ets.

Dogs, Guns, and Fishing Tackle Carried  
Free on our line.

Camp Cars for Fishing Parties and Families  
at low rates.

It is our aim to make sportsmen feel "at home" on  
this route. For Tourist's Guide, containing full in-  
formation as to Hotels, Boats, Guides, &c., and ac-  
curate maps of the Fishing Grounds, send to Forest  
and Stream office, or address

TO SPORTSMEN IN GENERAL!

Headquarters Bohemian Glass Works,  
214 PEARL STREET, NEW YORK.

MAKE THE FEATHERS FLY WITHOUT KILLING THE BIRD—SOMETHING MUCH NEEDED.

The Bohemian Glass Works having made a specialty of the manufacture of Glass Balls for Trap Shooting for the past year, and having facilities for manufacturing cheaper and better than other establishments, have secured the service of that well-known Sportsman,

IRA A. PAINE,

to take entire charge of the production of his new patent Feather Filled Ball, which we hold the exclusive right to make and sell.

In offering this new ball to the public it will require very little introduction, as in no instance where it has been exhibited has it failed to take the place of all others, and is to-day the only perfect substitute for a bird in use.

Every ball is weighed and examined, then packed with the greatest care, in barrels of 300 or boxes of 500. Send for price list. We intend offering special inducements to the trade.

Capt. Bogardus' Patent Glass Ball Trap and Rough Balls.

These Traps and Balls patented by Bogardus and used by him many thousand times, proves them to be just what is wanted by all

SPORTSMEN'S CLUBS AND AMATEURS.

THE PATENT ROUGH BALL—The only Ball that will break sure when hit by shot. Use none but the best. Every ball marked. Patented April 10, 1877; Traps, March 13, 1877.

Geo. E. Hart & Co.,

NEWARK, N. J.

TRADE SUPPLIED.

HUBER & MERWIN'S CHAMPION BALL TRAP.

We call the attention of the fraternity to the above trap, claiming to be the *vis plus ultra*. It combines compactness with durability, and is arranged, by a swivel on the bed-plate, to throw a ball in any direction or at any elevation unknown to the shooter, a screen preventing his seeing the direction in which the trap is set.

The spring, as the cut will show, is made of a steel rod or wire, bent spirally at the point of attachment, thus receiving the concussion its entire length, and preventing breakage.

PRICE \$10.  
FOR SALE BY

BARTON & CO., Sole Agents,

237 BROADWAY, NEW YORK.

This certifies that I have used every trap in market, and find the CHAMPION GLASS BALL TRAP, for durability and perfection of its operation, superior to them all, and take pleasure in recommending the "Champion" to sporting clubs and my friends. (Signed) IRA A. PAINE, Aug 9 1y

## DICKENS IN CAMP.

Above the pines the moon was slowly drifting,  
The river sang below;  
The dim Sierras far beyond uplifting,  
Their minarets of snow.

The roaring camp fire, with rude humor, painted  
The ruddy tints of health  
On haggard face and form that drooped and fainted  
In the fierce race for wealth;

Till one arose, and from his pack's scant treasure  
A hoarded volume drew,  
And cards were dropped from hands of listless leisure  
To hear the tale anew:

And then, while round them shadows gathered faster,  
And as the fire-light fell,  
He read aloud the book wherein the Master  
Had writ of Little Nell.

Perhaps 'twas boyish fancy—for the reader  
Was the youngest of them all—  
But, as he read, from clustering pine and cedar  
A silence seemed to fall

The fir trees, gathered closer in the shadows,  
Listened in every spray,  
While the whole camp, with Nell, on English meadows  
Wandered and lost their way.

And so in mountain solitudes o'er-taken  
As by some spell divine—  
Their cares dropped from them like the needles shaken  
From out the gusty pine.

Lost is that camp, and wasted all its fire  
And he who wrought the spell!  
Ah, towering pine and stately Kentish spire,  
Ye have one tale to tell!

Lost is that camp! but let its fragrant story  
Blend with the breath that thrills  
With hop-vines' incense all the pensive glory  
That fills the Kentish hills.

And on that grave where English oak, and holly,  
And laurel wreaths entwine,  
Deem it not all a too presumptuous folly—  
'Tis spray of Western pine.

—From the Overland Monthly.

For Forest and Stream and Rod and Gun.

## Old Habitations of a Lost Race.

RESEARCHES IN NEW MEXICO AND ARIZONA.

UP to the year 1875, rumor had been telling many marvelous stories of strange and interesting habitations of a forgotten people who once occupied the country about the head-waters of the Rio San Juan; but these narrations were so interwoven with romance that but few people placed much reliance upon them. To those well versed in Archaeology, ruins of an extensive and interesting character were known to exist throughout New Mexico and Arizona, and the various reports of Abert, Johnson, Sitgreaves, Simpson, Whipple, Newberry and others form our most interesting chapters in ancient American history; but their researches, aside from the meagre accounts published by Newberry, threw no light on the marvelous cliff dwellings and towns north of the San Juan.

In 1874 the photographic division of the United States Geological Survey was instructed, in connection with its regular work, to visit and report upon these ruins, and in pursuance of this object made a hasty tour of the region about the Mesa Verde and the Sierra EL Late in southwestern Colorado, the results of which trip, as expressed by Bancroft in the "Native Races of the Pacific Coast," "although made known to the world only through a three or four days exploration by a party of three men, are of the greatest importance." A report was made and published with fourteen illustrations in the Bulletin of the U. S. Geological and Geographical Survey of the Territories, 2d Series No. 1.

The following year the same region was visited by Mr. W. H. Holmes, one of the geologists of the Hayden Survey, and a careful investigation made of all the ruins. Mr. Jackson, who had made the report the previous year, also revisited this locality, but extended his explorations down the San Juan to the mouth of the De Chelly, and thence to the Moqui villages in northeastern Arizona. Returning, the country between the Sirreas Abajo and La Sal, and the La Plata was traversed, and an immense number of very interesting ruins were first brought to the attention of the outside world by the

Selected.

report which was published the following winter by Messrs. Holmes & Jackson. (Bulletin of the U. S. Geological and Geographical Survey of the Territories, Vol. II. No. 1.)

The occasion of the Centennial Exhibition at Philadelphia led to the idea of preparing models of these ruins, for the clearer illustration of their peculiarities, four of which were completed in season for the opening of the Exhibition. The first was made by Mr. Holmes, with whom the idea originated, and represents the "Cliff House of the Mancus Canyon," the exterior dimensions of which are twenty-eight inches in breadth by forty-six inches in height, and the scale 1.24 or two feet to the inch. This is a two-story building, constructed of stone, occupying a narrow ledge in the vertical face of the bluff, 700 feet above the valley, and 200 feet from the top. It is twenty-four feet in length and fourteen feet in depth, divided into four rooms on the ground floor. The beams supporting the second floor are all destroyed. The doorways—serving also as windows—were quite small, only one small aperture in the outer wall facing the valley. The exposed walls were lightly plastered over with clay, and so closely resembled the general surface of the bluff that it becomes exceedingly difficult to distinguish them at a little distance from their surroundings.

The second model of this series was constructed by Mr. Jackson, and represents the large "Cave town in the valley of the Rio de Chelly," near its junction with the San Juan. This town is located upon a narrow beach occurring about eighty feet above the base of a perpendicular bluff some 300 feet in height. It is 545 feet in length, about forty feet at its greatest depth, and shows about seventy-five apartments on its ground plan. The left hand third of the town, as we face it, is overhanging some distance by the bluff, protecting the buildings beneath much more perfectly than the others. This is the portion represented by the model. A three-story tower forms the central feature; upon either side are rows of lesser buildings, built one above another upon the sloping floor of rock. Nearly all these buildings are in a fair state of preservation. This model is thirty-seven by forty-seven inches, outside measurements, and the scale 1.72 or six feet to the inch. A "Restoration" of the above forms the third in the series, of the same size and scale, and is intended, as its name implies, to represent as nearly as possible the original condition of the ruin. In this we see that the approaches were made by ladders and steps hewn in the rock, and that the roofs of one tier of rooms served as a terrace for those back of them, showing a similarity, at least in their construction, to the works of the Pueblos in New Mexico and Arizona. Scattered about over the buildings are miniature representations of the people at their various occupations, with pottery and other domestic utensils.

The "Triple Walled Tower" at the head of the McElmo, is the subject of the fourth model. It was constructed by Mr. Holmes, and represents, as indicated by its title, a triple walled tower, situated in the midst of a considerable extent of lesser ruins, probably of dwellings, occupying a low beach bordering the dry wash of the McElmo. The tower is forty-two feet in diameter, the wall two feet thick, and now standing some twelve feet high. The two outer walls enclose a space of about six feet in width, which is divided into fourteen equally sized rooms, communicating with one another by small window-like doorways. The above are all that were exhibited at Philadelphia. Since then others have been made by Mr. Jackson, as follows:

"A Cliff House" in the valley of the Rio de Chelly. It is about twenty miles above the cave town already spoken of. This is a two-story house, about twenty feet square, occupying a ledge some seventy-five feet above the valley, and overhanging by the bluff. The approach from the valley is by a series of steps hewn in the steep face of the rock, and this method was the one most used by the occupants, although there is a way out to the top of the bluff. This model is forty two inches in height by twenty-four broad, and is built upon a scale of 1.86.

"Tiwa," one of the seven Moqui towns in northeastern Arizona, is a very interesting and instructive model, representing as it does one of the most ancient and best authenticated of the dwellings of a people who are supposed to be descendants of the Cliff Dwellers. Tiwa is the first of the seven villages forming the province as we approach them from the east, and occupies the summit of a narrow mesa some 600 feet in height, and 1,200 yards in length, upon which are also two other somewhat similar villages. The approach is by a circuitous roadway hewn in the perpendicular face of the bluff,

which surrounds the mesa upon all sides; it is the only approach accessible for animals to the three villages. Other ladder-like stairways are cut in the rock which are used principally by the water carriers, for all their springs and reservoirs are at the bottom of the mesa. This village is represented upon a scale of one inch to eight feet, or 1.96. The dimensions of the model are thirty-six inches in length, twenty-nine inches in width, and fourteen inches high.

In the Spring of 1877, Mr. Jackson made a tour over much of the northern part of New Mexico and westward to the Moqui towns in Arizona, and secured materials for a number of very interesting models, illustrating the methods of the Pueblos or town builders in the construction of their dwellings. Two villages have been selected for immediate construction as showing the most ancient and best known examples of their peculiar architecture, viz.: Taos and Acoma, the one of many storied, terraced houses, and the other built high up on an impregnable rock.

The model of Taos is now completed, the dimensions of which are forty-two by thirty-nine inches, and the scale one inch to twenty feet. Of this town Davis says: "It is the best sample of the ancient mode of building. Here are two large houses, three or four hundred feet in length and about one hundred and fifty feet wide at the base. They are situated upon opposite sides of a small creek, and in ancient times are said to have been connected with a bridge. They are five and six stories high, each story receding from the one below it, and thus forming a structure terraced from top to bottom. Each story is divided into numerous little compartments, the outer tier of rooms being lighted by small windows in the sides, while those in the interior of the building are dark, and are principally used as storerooms. The only means of entrance is through a trap door in the roof, and you ascend from story to story by means of ladders on the outside, which are drawn up at night." Their contact with Europeans has modified somewhat their ancient style of buildings, principally in substituting doorways in the walls of their houses for those in the roof. Their modern buildings are rarely over two stories in height, and are not distinguishable from those of their Mexican neighbors. The village is surrounded by an adobe wall, which is just included within the limits of the model, and incloses an area of eleven or twelve acres in extent. Within this limit are four of their *estufas*, or secret council houses. These are circular underground apartments, with a narrow opening in the roof surrounded by a palisade, ladders being used to go in and out.

These models are first carefully built up in clay, in which materials all the details are secured, and are then cast in plaster, a mould being secured by which they are readily multiplied to any extent. They are then put in the hands of the artists, and carefully colored in solid oil paints to accurately resemble their appearance in nature; and in the case of restorations, or modern buildings, all the little additions are made which will give them the appearance of occupation.

The survey is in possession of the data for the construction of many more models, and they will be brought out as opportunity is given. They have also in connection with the ruins multiplied many of the curious pieces of pottery which have been brought back from that region by the various parties connected with the survey.

For Forest and Stream and Rod and Gun.

## TROUT FISHING IN PIKE COUNTY, PENN.

At a time when it is so much the fashion among sportsmen to wander fast and wander far in search of game fish, game birds and game animals, and when the papers so constantly tell us of miraculous catches and enormous slaughtering in lands far distant from those we live in, it has become too much a habit with all of us residents of the Middle States to overlook the advantages with which nature has blessed our own section of this broad land.

When we want quail we think that we must pack our breech-loaders, take a barrel or so of cartridges with us, and tearing loose from all semblances of civilization, go, bag and baggage, to the most primitive districts of the Carolinas. If we would slay grouse, the Western prairies alone are broad enough to gratify our ambition, while the disciples of Walton, in their eager search for *Salmo salar* or *Salmo fontinalis*, lie

away far north to the farthest limits of Maine and Canada, and even penetrate that unbroken forest where the broad Nipigon pours down its stream to the northern waters of Superior.

If there were any necessity for journeys such as these, involving invariably large outlays both of time and money, we were unfortunate indeed; but the reason for them mainly exists in the imaginations of those who condemn the sporting facilities of their neighborhood, without, very often, having tried them. True sportsmen, whose aspiring minds make them long to chase buffaloes and to be chased by grizzly bears, must follow the advice of the lamented founder of the *Tribune* and "go West;" but those of a more reasonable disposition can find all that they want in the shape of game without the tremendous journeys that some think unavoidable. To be sure, one cannot kill so many quail in Jersey as he can in North Carolina, nor will the trout that he catches in Pennsylvania approach in size their magnificent brethren of British America. But if the birds are scarcer, the skill needed to make a good bag is more justly an object of honest pride, and hackles earn prizes in our own beautiful mountain streams as surely as beneath the gloomy pines of Canada. The truth of the whole matter is, that in this country, where we do everything at a pace that kills, and on a scale so magnificently large that the very size of our schemes make them quickly topple over; where we build railways that are not wanted, to places that do not exist; where petty larceny is no longer known, we have become dissatisfied with moderation in sport as well as in work; and because we can no longer make the same bags of game in a well settled country that our fathers did in a tangled wilderness, we are discontented with our lot, and hurry off to other places, each man racing with his neighbor that he may get to his destination, before shooting in season and out of season, fishing with nets and poisoning streams have sent the game of that region, too, to the happy hunting grounds, where, let us hope, they will be more kindly treated by defunct red men than they have ever been by the live white.

All this is but a long preface to a short story, for this article has been written only to tell those of your readers, who will not skip the rest of it in disgust, of one place at least, within easy reach both of New York and Philadelphia, where, if they are fishermen, they can find game enough to satisfy a moderate minded angler.

The place referred to is in Pike County, Penn., and, with its beautiful Blooming Grove Park, is well known, by reputation at least, to many of your readers, though there are numerous spots in that land of "Forest and Stream" that are too little visited by devotees of "Rod and Gun," and the experience of the writer—a frequenter of them—may not be uninteresting to those less intimate than he is with the wonderful resources in the way of game that old Pike possesses.

One great advantage of the place is its accessibility, being only four hours from New York on the Erie Railway, while Philadelphians gain access to its southern border by stage over a beautiful post road from Stroudsburg, a village near the famous Delaware Water Gap. Milford, the county seat, a village of about 1,200 inhabitants, noted for the attractiveness of its surroundings, is the best place to make one's headquarters. It is built in a wide amphitheatre, on the bank of the Delaware, from which the hills curve back for a mile or so, as if for the very purpose of leaving the only level ground in Pike County large enough to hold a fair sized town. There are several excellent inns here that are much frequented in summer by those who are in the close pursuit of health and happiness. The village is seven miles south of Port Jarvis, a prominent town on the Erie Railway, and a mail stage connects daily with the morning trains. In the immediate vicinity of the village itself game is by no means so plenty as it was some five and twenty years ago, though there is still admirable trout fishing within a few miles, while black bass fairly swarm in the Delaware, and can be taken in large numbers toward the end of August or the beginning of September.

The best trout stream near Milford is, in my humble judgment, the "Raymondskill," four miles south of the town; for, though there are fewer fish in it than in the more celebrated "Sawkill," which empties into the Delaware through the town itself, those that are caught average higher in weight and are, by long odds, more gamey. The stream itself takes its rise in a heavy and tangled swamp, some six or eight miles back of Milford; but, though its course is short its current is always broad and deep, and there are but few places where a fly cannot be cast with ease and effect. Part of the stream is preserved, or, rather, you are charged for fishing some of it; but a fifty-cent piece will procure all the right of way one wants for a long day's fishing, and if the skillful reader will take his rod some "safe day," as the Scotchmen call it, in early June, and fish from Regnier's down to Loreau's, he will go back to Milford, wet and muddy, to be sure, but well rewarded if eight or ten pounds of the spotted beauties can compensate him for a hard day's work and many trials to his patience. The upper branch of this stream, known as the "Dwarfkill," is well stocked with small trout, and if the angler chooses to fish it, in spite of terrifying tales of rattlesnake dens that lie upon its rocky banks, and is willing to unhook his flies from the trees they are caught in twice out of every three casts; or if he will condescend to fish with "wums," he will bring home a large basketful that will average about a quarter of a pound.

The "Sawkill," a glorious stream, some twenty-five or thirty feet broad, and in most places not over knee-deep, as it tumbles along over mossy boulders; is probably the most fished stream in Pike County. Throughout its seven miles course it is picturesque, every inch of it; and though so well fished, its supply seems inexhaustible, and of late years the fishing has much improved, owing to the fact that the farmers charge from fifty cents to a dollar for the right of way through their fields—miraculously to preserve the fish and pay for any damage done to the "crabs" by the anglers' boots, really to make the money, and have the additional pleasure of sticking a "city chap."

Penny's farm and Bull's meadows are the best places on the stream, but there is excellent fly fishing as far down as the high falls, and on a suitable day in May or June the angler need have no fear of not filling his basket, though, as before stated, the run of trout is smaller here than in the Raymondskill.

North of Milford, on the Port Jarvis road, there are but two streams of note, the "Vandermark," at the northern edge of the village, and "Ryder's Brook," some three miles further on. The latter is a small stream, heavily wooded, and strictly preserved. Nothing but favor can procure the right of fishing here, money—*mirabile dictu!*—having no effect on the hard heart of the owner, so that this stream is more for the lovers of the picturesque than for the angler. As for the "Vandermark," my advice to any one who thinks of fishing it is similar to that given by Punch a great many

years ago to those about to be married—"Don't!" Though you will catch fish you are absolutely certain to lose your way; break your rod, and spoil your temper in the horrible laurel brakes through which it flows.

South of the village, but still within easy reach, is "Adam's Brook;" but whether called after the first man or one of later birth is, to the writer, an unknown mystery. The lower part of this stream is picturesque in the highest degree, but difficult proportionately, so far as scrambling along it goes, though well worthy of a visit. Here the trout are few but large, while the upper part of the creek is more plentifully stocked with big fellows that are guarded from the ardent angler by a party who lives on the banks, and who threatens all sorts of battle, murder and sudden death to the presuming mortal who dares to trespass on his land. As he is reinforced by a bulldog and a shotgun, his trout are pretty severely let alone, and he lets them all to his own selfish contemplation. Further away are "Dingman's Creek" and the Indian Ladder Creek;" but these, like "Ryder's Brook," are meant more to be looked at than fished.

In all of these brooks there are trout, and large ones—great lusty fellows, of a pound—aye, and many that will turn the scale at two, and even more, but to catch them both skill and industry are needed. All the maxims of the wisest masters of the art must be put in practice by those who seek a large reward in these well-fished waters. Every trout a foot long in Pike County is educated. For years he has successfully eluded the snares and plots of those who have sought him, and wonderful are the stories of cunning on his part that you will hear from the village sportsmen. Here a tyro can fish from morn to dewy eve without getting anything heavier than a quarter of a pound attached to the end of his line, unless an unhappy club or misguided sunfish be tempted by his gaudy fly. But if a skilled fisherman chooses well his day, he can always be sure of a good catch. May and June are the best months—say from May 10 to June 15, and though the mosquitoes and midges will bother one a little, they are not very bad. In July, when the streams are low, it is perfectly useless to fish, except in the very early dawn or in the gloaming; or, better still, under the bright beams of the summer moon. Then, if the angler casts far and lightly, he will raise big fellows in the still waters of Bull's and Penny's, on the "Sawkill."

The best flies, so far as an extended experience of these waters has taught me, are the white-winged coachman—a yellow-bodied fly with red hackle legs and dark wings; and a bright green-bodied fly with mottled gray and black wings and dark legs. These are always taking, but white millers and red hackles are useful adjuncts.

Ten miles back of the town is the "Shohola," a grand stream, wide and deep, here racing over broad rocks and stones, worn by the rushing waters of centuries, there spreading out into long, deep stretches, calm as the smiling sky above. The headwaters lie far back in the Blooming Grove Park, but at this point the fishing is free for all comers who ask for permission to angle at McCarthy's—the one house that is near the falls, below which lie the best stretches for fly fishing. In June, when the water is right, great sport is had in this stream and in Rattlesnake Run, one of its main branches, and very large fish are frequently taken in both. The country is nothing but a wilderness, and is said to be owned by an association of New York gentlemen, who have certainly taken but feeble steps either to improve it or to preserve the game.

In the southern part of the county the three most prominent streams are the Big Bushkill, the Little Bushkill and the Saw Creek, all of them famed, and justly so, for the gameiness and size of their finny inhabitants. To fish them an early start should be made—not later than the middle of May if good sport is expected, for when the streams get at all low, all the trout run into the deep, lagoon-like stretches that are so frequent on them, and very sensibly refuse to be caught. The best place to fish the first and the last of these brooks is Portersville, which, though it boasts an imposing name, is today as wild in its primitive beauty as when the Minnesota Indians roamed on the shores of the sheet of water by which it stands. A few miles further down will afford better fishing, so far as Saw Creek is concerned.

Portersville, to tell the truth, consists of but one house, and as there is not another within five miles of it, and all around the lovely lake is an unbroken wilderness, through which deer and bear roam at their own sweet wills, it is difficult to say how it ever received its high-sounding title, unless it sprang from the diseased imagination of its first inhabitant, who, rumor has it, was wild enough to believe that he could plant a colony there. The approach to it is over a road that must be traveled to be appreciated. It is essentially lumpy, and one's first idea of it is that all the inhabitants of Pike County have, since the time when the memory of man runneth not to the contrary, used it as a place to pile up their spare rods. Over this trail—one it be dignified by the name of road?—for miles through a country that shows no other sign of the presence of man you must go, till you reach the lake, yelp, in a homely manner, "Porter's Pond." Here you can either board at the solitary house or strike off to one of the streams, and make a camp on its pine-covered banks. If you do the latter—and it will be preferable—remember that in the rare mountain air, May nights are cold, and warm clothing is needed even when the mid-day sun teaches us something of the coming summer. Wisdom dictates that plenty of fire-wood be cut and hauled before daylight darts, and leaves you to the cool, night winds.

In either of these streams, and in the Little Bushkill some eight miles off, as well, you can be sure of trout, and, if you know how to catch them, long and heavy and gamey fellows, too, who will try patience and tackle to the utmost, and make your heart shoot with a pure delight when you have foiled their desperate efforts to escape; and if the charms of a pure and healthy atmosphere can compensate for the absence of "poor humanity," certain it is that a week's camp on the Big Bushkill will give nothing but pleasure and fresh health and vigor to him who is willing to try it.

There are other streams in the county—the Scrventine, the Komeshaugh, the Slot and many more—but those named are unquestionably the best of all that are not preserved by the Blooming Grove Park Association, and in them all fishing will prove a pleasant task. Nearly all are sufficiently clear of trees to make fly fishing practicable, while some in their size more nearly approach rivers than brooks. Remember, though, in fishing, as in everything else, "*Non sine pulvere, palma*," and he who goes to the places I have named and expects trout to jump into his fishing basket, will be most woefully disappointed, and will probably consider the writer of this a most profound humbug.

Though this article is headed "Trout Fishing," it may not be out of place to briefly refer to the fact that splendid black bass fishing can be had in the Delaware, in every swirl and

rapid of its crooked course; and also to say to lovers of less noble fish than the dainty trout, that throughout the country there are innumerable ponds or lakes, and that in no one of them can the angler fail to catch a string of yellow perch, pickerel and catfish. The latter are wonderfully game, and grow to a size and attain a flavor that would cause the ardent devourer of a catfish-and-waffle supper to open wide both eyes and mouth, could he but see them. *Rout de mieux*, they are not bad fun on a light trout rod; better sport than the more highly reputed pickerel, which, in my opinion, does too much fighting when he is safe on shore, and not enough while still in his native element. The yellow perch, too, are fine large fish, easily caught and still more easily eaten when panned soon after their capture.

In conclusion, let me assure those anglers who have neither the time, money nor inclination to take any formidable trip, that they will find exactly what I have described, if they care to follow my gratuitous advice. No great outlay of money is necessary. Board in Milford is good and cheap; \$10 per week. *Pour-bores* will not be rejected, nor can fishing be had simply for the asking on some of the streams, but the prices charged are moderate and will worth paying, as the fact that a charge is made has greatly decreased the number of ragamuffins who fish the streams, and who are invariably just in front of one.

Of the birds and deer of Pike County I here shall say no word, nor of the matchless beauty of its scenery. Artists and poets have been busy with its rocky gorges, its waterfalls and its glens. More skillful pencils and abler pens than those of mine have told its story on canvas and on paper. Only to the fisherman do I now talk, and to him I say: When the spring time comes again, when new flowers are blooming in the fields, when the glantine blushes brightest in the hedges, go where, far from all cares and troubles, nothing but pleasure can await you; go with the flower of May, the arbutus, to the places I have told you of, and I bid you go, goodspeed. In the words of Old Izaak, "May the east wind never blow when you go a-fishing."

QUILMER.

For Forest and Stream and Rod and Gun.

## MOOSE HUNTING IN NOVA SCOTIA.

IN the middle of June, '77, I, with two men, went to my old camping ground for the purpose of peeling birch bark enough to repair my winter camp, and build two calling camps for the present October, it being the first of the open season for moose and caribou for three years.

Those who have never peeled a birch tree with a pair of clippers have a pleasure in store that cannot be conceived of. By commencing at the foot of the tree and peeling upward as high as you can reach, by simply making a straight cut down the bark, it immediately bursts open, and, with a very slight touch, falls off in good peeling condition, or, as the Indians say, "moon right." Then, grasping the tree with both hands like a bear, and imagining yourself to be a game rooster, you drive both spurs into the tree and walk up. After going up twenty or thirty feet, your legs begin to tire, you fail to drive the spur far enough—then, "stand from under, any one down" there, "as you are sure to go down that tree like 'greased lightning.'" Talk of a greased pole, there never was one to equal it. After peeling, you proceed to roll the bark in bundles from twenty-five to thirty-five pieces in each, and bind with astrang withe made of yellow birch plum tree, in the wood, or witch hazel. In these bundles, with nothing to protect them from rain and snow, they will last fifteen or twenty years, and be as good as ever for camp building.

In one day we obtained enough for two camps. In September I selected the ground for building, one and a half miles from where I obtained the barks; carried them to the spot, and began to build our tents. This was done by logging up three feet high, ten or twelve feet square, then setting poles from the four corners to a peak at the top, and binding with a stout withe, filling in the side poles about one foot apart, and barking up nearly to the peak. The higher the camp the better draught and less smoke, as an open fire is used.

When we require a winter camp, we cover the bark outside with fine boughs about one foot thick, which are held in their place by placing poles against them. When covered with snow it is very warm, the boughs preventing the snow from melting off by the heat from inside.

Camp number two was built four miles from the winter camp; at this place I fortunately found barks in splendid condition, which had been peeled by the Indians fifteen years ago.

The night Ned and I barked that camp I will never forget. It was the 13th of September, we did not reach the ground until dark, then to be met by one of the most terrific thunderstorms I ever heard. As soon as we got coats and packs off our backs we began to bark up. Every nail that was driven was done by the glow from the lightning, it being incessant, and for thirty minutes the thunder never ceased, but rolled up and down the vault in which we were, out across the plains to be echoed back again by the belts of timber in terrific roars, or in soft murmurs from the hills across the river, two miles away. The flashes of lightning, the roar of the wind, the rain that fell in torrents on the maple and birch leaves, all conspired to make the sight and sound awfully grand.

My two camps for calling being ready, I had provisions for two weeks portaged into camp, so as to be ready on the first of October. On that day I started down the coast two miles to see some of the old hunters and ascertain about the direction the moose were travelling. When about half way down, on going through a piece of timber, I saw fresh signs of moose on the road, so tying the pony up to a tree, I followed a quarter of a mile into some timber. There, not twenty yards from where I stood, above a little knoll, and between two trees, I could see the antlers of a three years old moose, lying down, nothing but head and neck exposed. I tried my favorite shot—the neck bone, which I nearly severed. In trying to get up, he would fall forward on his head, then down on his side. I did not watch him long before the knife severed the arteries of his neck. After having dressed him, I returned home, only four hours having elapsed since I left, having driven nine miles in the meantime—rather sharp work. The following day Ned and I carried him out to the wagon.

As this looked so promising I left that afternoon for the calling camp seven miles from the nearest settlement; but the wind blowing until late, I could not call, so returned to camp. Being anxious about the morning calling, I arose frequently in the night to look at the weather. At three in the morning I called Ned and at four I left the camp.

After walking a mile and a quarter by the light of the moon

## Natural History.

### CHIMNEY SWALLOW. CHIMNEY SWIFT.

*Chaturus pelagicus.*—BAIRD.

ACCORDING to Baird, Brewer and Ridgeway, the specific characters of this species are as follows: "Tail slightly rounded, sooty brown all over, except on the throat, which becomes considerably lighter from the breast to the bill; above with a greenish tinge, the rump a little paler; length, 5.25; wing, 5.10; tail, 2.15 inches. It is distributed throughout the Eastern United States and British Provinces, from the Atlantic Ocean to the fiftieth parallel of north latitude. It probably extends West to the slopes of the Rocky Mountains, as it has been taken as far West as the Bijoux Hills in Nebraska.

"It arrives in Eastern Massachusetts the last week in May, and departs for the South about the first of September. Soon after their arrival they commence to build their nests, which are very neat pieces of architectural work. The nest is composed of small twigs of uniform size, interwoven into a semi-circular basket. In selecting the twigs with which to construct the nest, the swift seems to prefer to break from the tree such as are best adapted to its wants, rather than to gather those already scattered upon the ground. This is done with great skill and adroitness while on the wing. Sweeping on the coveted twig, somewhat as a hawk rushes on its prey, it parts it at the desired place, and bears it off to its nest. This fact is familiar to all who have attentively observed its habits. Each of these twigs is firmly fastened to its fellows by an adhesive saliva, secreted by the bird, and the whole structure is strongly cemented to the side of the chimney in which it was built by means of the same secretion. When dry this saliva hardens into a glue-like substance, apparently firmer even than the twigs themselves. In separating a nest from the side of a chimney, I have known portions of the brick to which it was fastened to give way sooner than the cement with which it had been secured."—*Dr. Brewer.*

Oftentimes, however, the nest becomes so moistened by long or heavy rains, that it falls, together with its contents, to the bottom of the chimney. The young birds cling to the sides of the chimney with their strong claws, and often escape being precipitated to the bottom of the chimney with the fractured nest. Even when undisturbed the nest soon becomes too small for the young birds, and they climb to the top of the chimney, where they are fed by their parents till they are able to fly.

Immense colonies often inhabit the same chimney, especially if it be one with many flues. In May, 1868, a chimney was taken down in a village known as Putnamville, in Danvers, Mass. It was a large chimney, connected with a shoe factory, which had not been used for four or five years, and it contained upward of two hundred nests.

Its original breeding-place was in hollow trees, but as the country became settled, and the forests cut down, it has changed its habitation to chimneys, where the majority now breed. In wild portions of the country they still breed in partially decayed trees. Mr. George A. Boardman, of St. Stephen, N. B., found them breeding in this manner as late as 1868, when he found them nesting in a hollow birch. He also met with a nest built against a board in an old winter logging-camp at a distance from any chimney. It was found to be quite abundant in Kansas by Mr. J. A. Allen, breeding in hollow trees in the forests chiefly.

Its nest is occasionally found in other situations. Perhaps the birds are taught by their experience to look for more secure places than chimneys in which to breed. Mr. John H. Sears notes the breeding of the species at Beverly, Mass., in the *American Naturalist* for December, 1873. He says: "About June 15, 1871, a pair of chimney swallows (*Chaturus pelagicus*) commenced building a nest in the barn in close proximity to the nests of the common barn swallow (*Hirundo horreorum*). The nest was finished by the 4th of July, and four eggs were laid. In 1872 there were two nests built in the barn, and this year two more were built, one of which I took down on July 8 and sent, with four eggs which it contained, to the Peabody Academy of Science. The nest that I removed was replaced by a new one about the 20th of July." Another instance is cited by Mr. C. Hart Merriam in the same magazine for June, 1874. It was in Lewis County, New York. Mr. Frank H. Nutter, of West Roxbury, informs me that while on a visit to Lancaster, N. H., in June, 1877, he found a nest in the end of a barn, near the apex of the roof. The nest was of the typical form and was attached to the boarding. It contained eggs when found. The birds were observed to pass in and out through a knot-hole in the boarding.

In its habits it is crepuscular, preferring dull, cloudy weather, early morning, or the latter part of the afternoon in which to search for the insects which form its food. It is undoubtedly influenced by the abundance or scarcity of food, as it is occasionally observed pursuing its prey in the glare of noonday. When they have young they are often obliged to keep up their search into the night.

The eggs vary in number from four to six; they are pure white, without markings, sub-elliptical in shape, and vary in size but little, measuring .75 to .81 of an inch in length, by .50 to .55 in breadth.

The chimney swallow raises one, sometimes two, broods here in a season.

Before migrating they collect in large flocks. During the first week in September of the present year a flock of several hundred had their rendezvous in a large chimney. Here, collecting just before dusk, they would circle around the chimney, and pass down into it in a continuous stream till the whole flock had disappeared. They gathered thus for three days, and were not seen afterward.

ARTHUR F. GRAY.

Danversport, Mass., Oct. 13, 1877.

### AN ANTEDILUVIAN MONSTER.

AN article with the above heading is now revolving, meteoric like, through the vacant spaces of newspapers. People crave for mastodons, and behemoths, and their longings must be satisfied. Take the ordinary newspaper reader; he may be devouring a singularly horrid murder, or a rascally embezzlement, but let his eyes catch the notice of some bones dug up anywhere and he is ready in the most guileless way to swallow a mammoth at a single gulp. Of course we by no means wish to discredit the statement made, that in Henry Woodward's ranch in Indian Territory, near a mineral spring, the remains of some huge brute were discovered. The locality indicated is just the one where a creature of past ages may have been mired. But what we must smile at is the credulity which would allow any one to suppose that because, as per statement, other bones were found resembling those of a man, that it was the mammoth that had swallowed the human being. That well-stocked arsenal of flint weapons described as having been discovered with the human remains, must be taken with a great deal of salt. It is by no means impossible to believe that prior to the destruction of these huge beasts man existed. Traces have been found of man's handiwork, even in lower geological strata, or underneath the bones of extinct animals. There is every reason to suppose that the age of man is older than that of many of the so-called antediluvians. Still, up to the present day, we may affirm that, with the exception of one single skull, over which there has been no end of wrangling and discussion, and whose age is not yet well established, no positive remains of man contemporary with the mammoth have been discovered. Of course, the argument that man did exist then is as strong as need be, but his bones have got to be exhumed. Possibly "dust to dust," that great law of God, as far as man's scaffolding goes, has prevented it.

The conclusion arrived at, that it was the beast who devoured the man, is a ludicrous one. These monstrous brutes, as far as we can make out, were vegetable feeders. Suppose, to carry out the argument further, the bones of some smaller animals were found near the man. Should we jump at the conclusion that the man had swallowed a rabbit, and then that the mastodon had gobbled up the man and the rabbit too? It would be well for newspaper scientists to have recalled to them a very old story, attributed to Cuvier. An awful creature, with horns, cloven feet and a tail, once met a timid naturalist, and the awful beast, flourishing his tail and lowering his horns, bellowed out, "I am going to eat you up." "I ain't a bit afraid," answered the naturalist, suddenly picking up courage. "Horns, hoofs and a tail proclaim you to be herbivorous and not carnivorous. Clear out of my way and let me go on collecting my specimens."

We are, then, perfectly willing to accept all about the tusks, and how they crumbled as soon as they were exposed to the air. We even credit the flint arrow-heads and the stone knives, a whole bushel basket of them, but the big Injun, "eight feet long, with his spinal column attached to a cranium, and his ribs and other appendages," we cannot digest any more than the antediluvian monster.

### PARASITES ON THE HOUSE FLY.

ROCK ISLAND, Ill., Oct. 15, 1877.

EDITOR FOREST AND STREAM AND ROD AND GUN:

Is it generally known to entomologists that the common house fly is sometimes infested with parasites? I am not as well "posted" in insectology as I should be, perhaps, my study of animated nature having been mostly devoted to those branches which furnish more imposing specimens, and it may be that a fact which is new to me, will have a "stale" appearance to most of your readers. Nevertheless, I venture to send you the following, which had for me all the interest of an original discovery, with the request that if the fact is already known you will give me any other information you may chance to have upon the subject.

Yesterday afternoon, while examining a common fly of medium size with a small microscope I noticed that it was covered with a number of small insects which were utterly invisible to the unaided sight. I counted seven of them, four of them being huddled together in a bunch, and the other three running separately over the fly's body. They all appeared to confine themselves to the under part of the body where the legs are united, occasionally running out upon these limbs. The outlines of the bodies of these parasites, looking down upon their backs, was of an oblong shape, the length being nearly twice as great as the width. The bodies themselves appeared to be round and plump. They were covered with what seemed to be a smooth, hard shell or skin, of a transparent yellowish color, reminding me somewhat of amber. Each had three claw-like legs on each side of its body, while its head or snout was armed with a pair of sickle-shaped mandibles, which opened sideways. I could not get a good view of their heads owing partly to their movements and partly to the low power of my lens, which only magnifies ten diameters. Judging from their apparent size, I should place their actual length at about 1-150ths of an inch.

I afterward caught and examined some score of flies, but could find no trace of the "vermin" on any save the first. I do not remember ever seeing the subject mentioned, and if th

through timber and scrub, I arrived at the meadow at which I proposed to call. Standing at its edge, I listened for five minutes; not a sound, not a leaf stirring, not a breath of wind, nor a bird moving. Bringing the bark to my lips, I gave the first low, soft, timid call, but the way it echoed up and down the woods seemed more like a roar. Five, ten, fifteen minutes pass, not a sound, save my call, mocked by that bird of ill-omen, to hunters the carrion jay. This time I repeat my call more loudly and clearly; the same echoes multiplied and louder, nothing else. "Nothing, Ah! what's that, a squirrel budding? No, not before dawn. Then it must be a horn against a tree; it can't be a young sneaker, for he would not dare make that sound; nor an old buck with cows, for he would have answered once at least; then it must be an old solitary buck. Yes! listen, as he comes head up trying to avoid nothing, and with his powerful swinging step. I can hear my heart beat, but I try to keep cool, yet my ears keep following that welcome and louder growing sound. He must have come at least a half mile since I first heard him. 'Ah! there he is, and I see the tips of his antlers, two hundred yards off, among the alders. Still he comes, but now out of sight in one of his swervings. Will he come nearer? Yes, a few steps; there he pauses again for a minute. I dare not call, but I place my foot in the moss, and make a sucking sound like that of a cow stepping, a few sharp strides and he is in sight, head and antlers only, sixty yards off. O, what a poor chance to shoot, standing, face to, yet I must. Up goes the rifle; but what's the matter, I can't shoot, my heart beats too fast, nonsense! I steady myself with a shake. In the meantime he moves his head with that grand swerve sideways; now the eye! One glance along the sights, at that piercing black savage orb. A cloud of smoke, and a black mass plunges forward, turns, and springs back on his tracks. Above the alders I can see the tips of his antlers, judge for his heart and fire; still he goes on and out of sight. With all the speed I can, I cross the wet meadow and stand in his tracks; for an instant I listen. Ah, that cough! Missed the heart but shot through the lungs. I spring forward and get a glance at him through the alders, and fire for the neck bone. Missed, by half an inch too high. Then the fore-leg must go. I fire at the near one as he raises it to step, but too far back, it passes through the thick of the shoulder cutting off two ribs, breaks the leg on the opposite side; then down he goes with a crash, carrying everything with him. I draw the knife and spring forward, but with his dying groan I can hear the blood gurgle in his lungs, so it is of no use to cut the throat.

I only stop a few minutes to examine him—the first shot entered the eye and passed down the neck. He is a beauty, in good condition, weight about one thousand pounds; four feet across the antlers, which have beautifully curved palms. Then I start back to meet Ned, as he promised to leave camp at daybreak with an ax. Before long I see him coming, hat in hand, "covering ground" pretty fast; as soon as he can speak he wants to know what I fired at. "A fox in the meadow." "You don't often fire four shots at a fox in an alder meadow. You've shot and missed a moose." I then showed him my hand with the blood on it. "Ah! you have him." "Yes, a little fellow." Then came an army of questions; but I don't say much, holding back, with a selfish pleasure, the surprise in store for him.

"Here is where I stood and called; where here he stood when I fired the first shot." I show him spots of blood as we follow his tracks.

"But how far did he go?" asks Ned in surprise.

"Two hundred and fifty yards."

"The devil!"

"No, the moose," as I point him out lying among the alders.

"A little fellow! By heavens, ain't he a beauty! ain't he a rouser?"

"Come now, Ned, plenty of work ahead of us to-day; this fellow to dress, a road to swamp, two days to make, skin of head and the antlers to carry out six miles."

The next day's work is a hard one. We leave home at three in the morning with a man and two horses to help, and do not reach home before nine o'clock in the evening.

After dividing among my friends we have but little left. On Saturday I try a little nearer home; leave at noon; go three miles back so as to get to leeward of the ground I wish to examine. Here I soon find fresh tracks, which lead to a thicket of firs and maples. There he lies; then he must be called out, as I would only start him by entering. I give one call, this brings him on to his feet not thirty yards off, where he stands answering in soft grunts. One glance along the sights at his heart and in firm; but he never moves a muscle. A second shot through the lungs and down the hill he goes at a fearful gait. Standing still I follow the sound until I hear him fall. On coming up to him I find a nearly pure bred elk, five years old, in a good condition, with a very pretty pair of antlers.

The reason he did not move at my first shot was that the ball had completely severed the principal artery of the heart. In nearly every case where I have shot moose or caribou through the heart they have stood as if never touched. I have noticed in your paper a discussion as to the dropping of antlers. About deer I know nothing, but of moose and caribou, and I can assure any one that they have no secret place in which to hide them, nor do they seek to do so. I have found them in all kinds of places, but never covered except with fallen leaves or spills from firs. I always in the autumn find more horns than animals—some partly rotted away, but the majority eaten by squirrels, porcupines or martens. Old moose drop their antlers as early as the middle or last of November; young ones sometimes not until the middle of March.

This part of our county has sportsmen from all parts; some few from New York, but they have poor success in calling because of the weather, and in creeping because they do not know how.

Jiggins Mines, Nova Scotia, Oct. 13, 1877.

—From the *Spirit of the Times*, of Oct. 6:

THE SPORTSMAN'S GAZETTEER.—Under this title, Mr. Charles Hallow, editor of the *FOREST AND STREAM*, has published an elaborate work, of nearly 900 pages, which is designed as a general guide to the principal game resorts of this country, illustrated with maps; together with instructions in shooting, fishing, taxidermy, woodcraft, etc., and copious information about the game animals, birds and fishes of North America, their habits and various methods of capture. It is a most important and valuable contribution to sporting literature, meets a want that has long been felt, and its author was eminently qualified to prepare it. In an advertisement will be found other particulars about the book.

fact is known I think it cannot have been very widely published. Respectfully yours,  
CHARLES STEPHENSON.

[The bare fact that the common house fly is infested with parasitic insects has long been known, but we believe that the subject has not been very fully investigated. The commonest of the parasites is a red mite known as *Astoma parviticum*, (for figure see Riley's Seventh Annual Report of Noxious and Beneficial Insects of the State of Missouri, p. 177). Another species infests the locust (*Calopteryx*) and destroys great quantities of them. House flies also suffer from a fungoid parasitic growth which often causes death. We hope that our correspondent will continue his investigations in this matter, and that others of our readers will contribute any information which they may have bearing on the subject. We cannot tell from the description what our correspondent's species is.—Ed.]

## HORNED DOE ANTELOPES.

NEW YORK CITY, Oct. 15, 1877.

EDITOR FOREST AND STREAM:

I have recently had brought to my notice the head of a female antelope which had a small pair of horns. The animal was killed in Nebraska, and my informant—a perfectly trustworthy person—assured me that she had not bred the spring before she was killed, and that, although quite old, as shown by her teeth, she had apparently never produced young. The horns in this specimen are small, a little over an inch in length, sharp and straight, inclining backward very slightly.

Will you tell me whether these horned does are common, and whether the horns ever grow to a large size—that is, as large as those of the bucks? Do the horns of the doe ever bear prongs, and are they shed as the bucks? When does the net take place in this species?

An answer to all these queries will oblige, yours respectfully,

BLAKE.

Horned does of this species are not very uncommon, and are, we believe, always barren. During the past autumn we killed or were present at the death of several, none of which gave evidence of ever having given birth to, or suckled, young. We believe that the proportion of barren does among antelope is greater than among deer, elk or buffalo. The horns on these barren does are generally quite small, though in one instance which came to our notice they were about three inches long. They sometimes have prongs, but these are usually so small that they can scarcely be seen. One killed in Nebraska less than a month ago has on each of the horns, which are less than two inches long, a little knob where the prong should be. We would refer our correspondent further, to a Report of a Reconnaissance from Carroll, Montana, to the Yellowstone Park and Return, by Col. Wm. Ludlow, U. S. Engineers. In the Zoological Report, p. 70, the following statement is made:

It is well known that the female antelope sometimes has horns and is sometimes without them. Observations extended over several years, together with the testimony of several plainmen, among them Charles Reynolds, a hunter of seventeen years' experience and a man of close observation, led me to conclude that the horned does are always barren. I have myself examined a great number of doe antelopes, with and without horns, and have never seen one of the former class that gave evidence of having produced, or being about to have, young. Nor have I ever seen a hornless doe that was barren. The horns on the does vary from one to three inches in length, and are soft and easily bent. Their length no doubt depends in a measure upon the age of the animal. Those that I have seen lack the hard, bony core which is found in the horns of the perfect males.

We should be glad to receive further information on this point from any of our readers. The rutting season is in October.—Ed.

Too MANY MONKEYS.—That influential British merchant did not write a clerical hand. What was worse, his spelling was not first class. There was a ship of his trading with the Indies. He wrote for two monkeys, and spelt it *too*, and forgot to cross his "t," so when the intelligent Bombay correspondent read the letter it was just 100 monkeys. As the order did not designate any peculiar kind of monkey, and the commissions were assured, just one hundred assorted monkeys were collected and duly forwarded. It was a mixed cargo which raised high-jinks at sea. As the monkeys could not all be caged the sailors had a time of it. You couldn't leave a thing loose on that ship, not even the anchor, that half a dozen monkeys did not have it, all at the same time. They stole the telescope, broke the quadrant, smashed the compass, ruined the chronometer, dropped the ship's log overboard, and all got drunk on the sailors' grog. They reeled the bob-stay, catted the shrouds, back-stayed the mizzen-spikes, close-hauled the capstan, jury-rigged the calaboose and keel-hauled the jib-boom. That ship, according to last accounts, has arrived at Liverpool flying a signal of distress. Anyhow this is about the gist of an amusing story in the *Hartford Times*.

—Giles Collins was his name, and Giles is a martyr. A poor laborer was he with a turn to bugs. Five lively Colorado beetles did he imprison in an empty beer bottle. The English magistrates fined him five shillings. Moral: It ain't good in England to banker after the Colorado beetle.

SINGING MICE AGAIN.—A valued correspondent sends us the following notes on singing mice, which are certainly very interesting:

From time to time I have seen in FOREST AND STREAM accounts of singing mice, and have noted that in your editorial comments you invite further information on the subject.

A few years since I lived with my family in the immediate neighborhood of New York City. The library, or family room, opened with folding doors into a conservatory, where, suspended from the ceiling, hung several cages of canaries. These cages were raised or lowered by cords passing through pulleys in the ceiling, and were secured near one of the shelves holding the plants. One evening, while sitting alone in the li-

brary, I heard from the conservatory a low warbling, like that of a young canary. I was surprised, for I knew that there was no young canary there, and, watching, I presently saw that the notes proceeded from a mouse which was running about in the bottom of the cage, eating the bird seed. The bird was sitting quietly on his perch, perhaps asleep.

On subsequent occasions I saw two or three of these little warblers at a time, sometimes in the cages, sometimes on the flower shelves. I have frequently seen them run up the cord and down into the cage. Once I crept under the cage, and, showing myself, put my hand on the cord where mousey would have to pass if he attempted to escape. He was puzzled; stopped, warbled, and then retreated into the cage again. They were wonderfully fearless for mice, though they wouldn't quite consent to be caught.

I presume they were common mice that from constant association with canaries had learned to sing. None of them acquired the shrill notes of the canary, only a low, sweet warble.

—Additional remains of the huge fossil bird, *Tethornis emarginatus*, have recently been found at Shoppey, England. These fossils make it appear that the bird in question had enormous wings, and was closely allied to, though much larger than, the albatross. Prof. Owen is engaged in the preparation of a paper on the subject, in which he proposes to substitute a more appropriate name for the one given by Bowerbank. The bones were found by Mr. W. H. Shrubsole, of Shurness-on-the-Sea.

THE CAPERCAILLIE IN NORTHUMBERLAND.—It is well known that this fine bird, originally indigenous in the British Islands, became extinct, and was re-introduced into the Scottish Highlands some forty years ago by the late Marquis of Breadalbane. Earl Ravensworth has recently been endeavoring to naturalize the capercaillie in large tracts of pine woods in Northumberland, on the edge of moors and wild crags, furnishing various berries which form its favorite food. In 1872 a cock and two hens were reared, but the male got destroyed. In 1873 two settings of eggs were hatched, but, owing to a wet summer, all the young birds perished after nearly arriving at maturity. In 1874 four fine birds were reared to their full growth, one of which, a male, still survives. In 1875 fifteen chicks were hatched out of twenty eggs, and three cocks and four hens grew to maturity. But the stock has become reduced to five individuals, three males and two females, all in good health. It appears that a difficulty arises from some deficiency in diet or conditions, which is at present unknown. Although extremely wild and shy by nature, and flying long distances, capercaillies are yet most indolent and unwilling to move from places to which they are familiarized. Their color assimilated very closely with the Scotch fir, so that it is exceedingly difficult to discover the male bird when seated on a branch.—*Nature*.

ZOOLOGICAL GARDEN AT CALCUTTA.—It seems very unfortunate that the attention once paid to the collecting of animals and their maintenance in Calcutta should no longer be considered possible. The genial character of the climate and the wonderful variety of animals we should have supposed would have made the Calcutta collection the first in the world. The former Viceroy of India, Lord Northbrook, took the Zoological Garden of Calcutta under his particular protection, but it seems that his successor, in view of the depletion of the Indian Treasury, has notified the Calcutta managers that they must no longer look to government help. It is a pity that the best position in the world for keeping and studying tropical animals should be abandoned for lack of a small support.

THE RED-HEADED WOODPECKER AS AN EGG-SUCKER.—*Editor Forest and Stream*.—The statement of your correspondent in regard to the common red-headed woodpecker killing young ducks reminds me of an incident that occurred last May at my gardener's place near the city. A hen turkey's eggs were pierced and emptied by some means unknown to my German. Six eggs had been "tapped" and the contents extracted. When the turkey went to her nest the seventh time she was watched. While upon her nest a red-headed woodpecker was seen to fly to the apple tree immediately over the turkey. The red-head chattered and dodged back and forth upon the tree until the hen moved off her nest, when immediately the thief hopped down from his hiding place and perforated the smooth egg. He extracted about two-thirds of the yolk, and then flew away. He certainly displayed modern taste for egg-nog.

Indianapolis, Oct. 29, 1877.

WHAT RED HEAD DUCKS EAT.—A week or two ago Dr. William H. Keener, of Baltimore, sent us the contents of the craw of a red head duck which he examined. They were composed of seeds and minute shells of species that we could not determine. Professor Eaton, of New Haven, however, to whom a part of the specimens were sent, says "that the seeds are undoubtedly those of *Ruppia maritima*, a slender salt water weed found in shallow bays along the coast from New England to Florida, in the Onondaga salt springs, and along the Northwest American coast. He has seen it plentiful at Watch Hill, R. I., and at the mouth of the Connecticut River." We are now endeavoring to determine the *forminiferous* and other shells in it, and will endeavor to give a more exact locality where the ducks were likely to be feeding when they ate them. The questions raised by Dr. Keener have initiated investigations which are likely to lead to important discoveries concerning the habitat and habits of the red head duck. We wish other correspondents would bring like discoveries to our notice.

ARRIVALS AT PHILADELPHIA ZOOLOGICAL GARDENS FOR WEEK ENDING OCT. 31, 1877.—One sparrow hawk, *Falco sparverius*, presented; one golden eagle, *Aquila audax*, presented; one little black headed duck, *Ptilula afinis*, presented; one great horned owl, *Bubo virginianus*, presented.

ARTHUR E. BROWN, Gen'l Sup't.

—Thetis, the mother of Achilles, plunged the future hero into the Styx to make him invulnerable to wounds. This typifies the importance of bathing to children as a safeguard against ailment. Bat not only bathing, but the accessories of bathing are of importance. To use a pure soap is most important. The new article, B. T. Babbitt's Toilet Soap, therefore, fills a most important purpose, for it is perfectly pure and delicate. No artificial perfume is needed to add to its fragrance, or to hide impure materials.—*Lade*.

## Fish Culture.

ARRIVAL OF MR. MATHER IN ENGLAND.—Our special correspondent at Southampton, England, writes, under date of Oct. 24, 1877, as follows:

Learning of the shipment of a large lot of salmon eggs in the Mosel, forwarded by Professor Spencer F. Baird, U. S. Fish Commissioner, for distribution in Prussia, Holland and Germany, I ran down to Southampton this morning to see Mr. Mather, and was fortunate enough to be on the dock as the fine steamer arrived. I soon found Mr. Mather, who was in the best of spirits, and none the worse for the trip. Of course Mr. Mather's great anxiety was in regard to his charge. I was shown the eleven unpacked crates, and the refrigerating box of his own invention, in which I could distinctly see the eggs. Mr. Mather is quite sure that the eggs are in good condition.

Mr. Frank Buckland will soon be here, and will witness the opening of the two crates intended for him. Two crates are to be left in Southampton for France, and the others are for foreign distribution. Everything seems to be going on well, and it looks as if the first great step of introducing our American salmon in the Old World is fairly accomplished.

WHITE BAIT.—The old discussion is going on in England, "What are white bait?" Mr. Francis Francis, of the *Field*, says: "They have kept something which has grown into a herring, but that something was not a Thames whitebait." Mr. Francis, we think, insists that the small fry caught and allowed to grow in the Brighton aquarium, was not a true Thames whitebait. This leading authority thinks that there may be some small herrings mixed up with the 'whitebait, not that the white bait *per se* is something else. Another correspondent "is quite certain that white bait are not young herrings," because "herrings never spawn in any water but pure sea water, and are never caught in brackish or sewage water; and white bait are only found in brackish water, often mixed with sewage." White bait are interesting to us, as we have heard more than once, on the best authority, that these little fish could be caught in the vicinity of New York. We may state at the same time that our leading ichthyologists are quite positive that white bait are young herring. We trust soon to obtain some reliable English white bait, and if we cannot feed with Prime Ministers on these dainty fish at Greenwich we shall indulge in the drier amusement of doing our best to discover what these puzzling little fish really are.

WHEN YOUNG SALMON SHOULD BE TRANSPORTED.—A very important question has been asked of us, which is as follows: "Quite a large number of the eggs of the California salmon have been received here. These eggs were to have been sent direct to Vermont to be hatched out there, in order to stock a piece of water in that State. From some cause the eggs are mature, and the fish are now ready to leave the ova. The necessity arises then of hatching them, out here. The question is, when the fish appear and are strong enough, ought they to be transported to Vermont at once, or must they be allowed to acquire a certain size here before moving? Of course, if allowed to grow, the trouble and expense of moving the fish to Vermont would be very much increased."

The answer to this question, is, that just as soon as the young fish have absorbed the yolk sac—say in about four weeks (the time being longer or shorter according to circumstances)—the fish should be sent to their home. Notwithstanding the risks of the ice and change of temperature, the young fish would be found capable of braving the rigors of the season in the Vermont waters. The reason explained by Mr. F. Buckland is quite a curious one. When the young fish emerge from the egg they are endowed with a certain instinct, the one perhaps implanted in all creatures—that of self-preservation. Almost immediately they begin to understand intuitively who are their foes. If young fish are hand fed and cared for, this instinct in a short time becomes, as it were, blunted. Of course, with such tiny things as young salmon, which have hardly passed their embryotic state, their lives are mostly due, exposed as they must be to predatory fish, to their ability to escape. It has been shown that young salmon, which have been cared for and fed, when put into water where there were even minnows, were immediately eaten up by the minnows. The little fish seemed to have forgotten their instincts, and were sacrificed in their innocence. Young fish, then, when it is intended that they should shift for themselves, must as speedily as possible be placed in such elements as may be natural to them.

Having consulted on this interesting subject what is certainly the highest authority in the country, we believe we are enabled to answer satisfactorily a question in fish culture in regard to which there has been some uncertainty.

AN ACRE OF WATER.—Speaking about the value of an acre of water devoted to the propagation of fish, the *Ohio Farmer* says:

We write from knowledge in this matter, having in earlier days caught many a "nice string" of fish in a pond that was formerly a swamp. During one dry August the owner, with two of his boys, went in it with a plough, scraper and shovels, and in a short time had a pond of nearly an acre in extent. This he stocked with fish common to the sluggish streams of the neighborhood, and procured some at a distance, and for years thereafter it proved to be the best acre on the farm.

FISH CULTURE IN NEW ENGLAND.—We are pleased to copy from the *Maine Farmer* the following words of encouragement:

The efforts made to restock the rivers of New England with salmon and other migratory food fishes are now meeting with

their first marked success. The earliest efforts were applied to the Merrimack River. This was originally a fine salmon river, but through reckless fishing and the erection of impassable dams, was entirely depopulated, as to that species, many years ago; the final blow to the fishing being given by the dam at Lawrence. Very soon after it was built, the salmon entirely disappeared from the river. The Lawrence dam is the first obstruction that they meet in ascending the river. For many years (seventeen or more), not a salmon was seen at or near this dam. For the last seven or eight years a fishway has been maintained, and a constant watch kept for salmon ascending it, but not one was seen until this year. On the 31st day of May last, the water of the fishway being drawn down for the purpose of examination, a large salmon was found in it. From that time through the month of June, the water in the fishway was drawn down once or twice daily, and salmon found therein every day, but two or three, and on some days as many as four salmon were found. The examination occupied about fifteen minutes each time, and during the rest of each twenty-four hours the water was running constantly, and probably salmon ascending all the time. This examination was continued until late in July, and salmon still continued to ascend. On the 4th of July four were found; on the 5th five were found at one time in the fishway and more close to the entrance of it.

Above Lawrence the salmon passed the dam at Lowell and Manchester, and were seen in large numbers at Livermore Falls, a place on the Pemigewasset, the principal tributary of the Merrimack, where it was a common occurrence for them to be seen ascending the falls. At Manchester, also, a great many of them were seen. There seems to be ground for estimating the number of salmon in the river at thousands; and before winter sets in they will have laid millions of eggs in the upper waters.

There has been a good deal of skepticism as to the possibility of restoring salmon to rivers from which they have been exterminated. But the evidence afforded by the Merrimack River is ample to remove all reasonable doubts. The measure of success is very gratifying, and is altogether above what those conducting the experiment had expected, and has renewed the interest taken in the subject by the people of New Hampshire and Massachusetts.

These salmon came from eggs that were taken at Bucksport, hatched in Massachusetts or New Hampshire, and set free in the upper waters of the Merrimack. Their return to the Merrimack is strong evidence in favor of the accepted theory—that salmon when full-grown will return from the sea to rivers in which they passed their infancy.

Another question answered satisfactorily is that of the practical working of the fishway of the Merrimack River, especially that at Lawrence, which appears to have answered its purpose admirably. In connection with this matter it may be remarked that the great fishway at Bangor, built last winter, has also proved entirely successful. There is also now no doubt of the success of the attempt to introduce shad into the Mississippi River and its tributaries. Several years ago young shad were placed in the tributaries of the Ohio by the United States Commissioner of Fish and Fisheries. These had to descend the river nearly two thousand miles, to the Gulf of Mexico, and, having attained full size, returned to the river. They actually did this, and not less than 400 grown shad, in fine condition, were caught last summer in the Ohio River near Louisville.

Altogether, the prospect of the complete success of fish culture in this country was never more promising.

**GROWTH OF TROUT.**—*Editor Forest and Stream.*—I notice in your last issue a communication with regard to the growth of trout in their first year. My experience teaches me that trout can be grown to seven or even eight inches the first year. In my Lodore hatching house I have trout hatched last January and February that will measure five inches to-day, and the past season has not been favorable for growing trout. I have not yet been able to make my land-locked salmon keep up with the trout fry in growth. The largest of these will measure about four inches now. In drawing off my fry pond in the spring, I seldom fail to find yearlings from seven to eight inches long.

Very sincerely yours,  
Torrington Hill, Conn., Oct. 31.

LEVI HODGES.

**LARGE TROUT.**—*Editor Forest and Stream.*—In your last, Dr. Garlick criticizes Mr. Hasbrouck's statement about the growth of trout. Now I don't know how either of these gentlemen measure the length of a fish. My understanding is that the proper measure is from the tip of the nose to the end of the tail, or caudal fin. If so, Mr. H. does not tell a very big fish story. For twelve years I have kept my fry separate from older trout, and at the age of nine months, which must have been about the age of those spoken of by Mr. Hasbrouck, have often had them from four to six inches long. I have also sold and put these fish into brooks and ponds where there never was a trout before, and their growth has been nearly equal to those spoken of by Mr. H.

From reading Dr. Garlick's article I judge that he kept his trout in small ponds near the spring. If so, they would not grow as fast as trout in warmer water or larger ponds. My practice is to sell my trout off for eating when two years old—the time the doctor says they begin to grow—and they average about half a pound. There is a greater contrast in the growth of fish than any other creatures, and trout that have been for many years confined in small shallow streams will get dwarfed. I think likely these are the kind that the doctor bred from. A portion of my trout come from eggs sent me by Seth Green in 1865 from the Caledonia ponds (now N. Y. State ponds) and I presume that Mr. H. obtained his stock from same ponds.

A. PALMER.  
Rosebud, Wis., Oct. 30, 1877.

**RICE FOR ONEIDA LAKE.**—The enterprising Central City Sportsman's Club, of Syracuse, have procured from Princeton, Minn., a barrel of wild rice which has been sown along the shores of Oneida Lake.

#### SPLIT BAMBOO RODS.

To our customers and the public:—In reply to the damaging reports which have been circulated respecting the quality of our split bamboo rods, by "dealers" who are unable to compete with us at our reduced prices, we have issued a circular which we shall be pleased to mail to any address, proving the falsity of their assertions.

### NOVEMBER.

Next was November; he full grosse and fat  
As fed with lard, and that right well might seeme:  
For he had been a-fatt'ing hogs of late,  
That yet his brows with sweat did reek and steem,  
And yet the season was full sharp and breem;  
In planting eke he took no small delight:  
Whereon he rode, not easy was to deeme;  
For it, a dreadful Centaure was in sight,  
The seed of Saturne and fair Nais, Chiron hight.

—SPENCER.

### ORCHIDS AS FLORIST'S FLOWERS.

IT has recently been mooted in the *Florist*, England, by Mr. Anderson, the well-known "Meadow Bank Orchid Grower," that Orchids are florists' flowers. Notwithstanding, he says, the grotesqueness of form and feature of the general run of Orchidaceous species, they are being fast elevated, as the florist would say—degraded, as the botanist might say—to the rank of florists' flowers. However startling the assumption may at first sight appear to many, it can, nevertheless, be supported by irrefragable evidence. Take any popular species, and what do we find? Why, this: that the variety which will best stand the severe scrutiny of a florist's eye is by far the most valuable. The same law that enacts that form, substance, color and general symmetry shall take precedence over the general ruck of florists' flowers holds good among all popular Orchids. Any one can find this out by trying to purchase the rarities among the varieties of species. The fact is that so innumerable are the importations of recent years, and so very numerous the varieties of species, that two-thirds of all the poor varieties—poor from a florist's point of view—are all unsaleable; at least, if people buy them, it is only to get rid of them as soon as possible after they have proved themselves. When he began cultivating Orchids, he was most anxious to secure anything in the way of a species, no matter what. Nowadays, collectors find it to be both to their interest and satisfaction in every way to secure first-class varieties, many times at whatever cost. Take *Odontoglossum* for instance, no matter whether it be *Alexandrea*, *Pescatorei*, *triumphans*, *grande*, *citronum*, *circosum*, or any down the line of species in any catalogue, some sorts will bring as many dollars at a sale, if they be known to be super-excellent, as others will bring cents. And so it is with *Cattleyas*, with *Vandas*, with *Brides*, with *Saccolabiums*, and with every popular Orchid. It may be form, or substance, or color, or exquisite symmetry, or all combined; but the individual that possesses all these in the greatest degree will be run upon by the savans in the matter of flower-value. "I have therefore," he adds, "to congratulate the General Assembly of florists for the good work they have done, are doing, and doubtless will continue to do, in bringing together the above races of plants, from the commonest border flower to the most aristocratic Orchid, so as to subject them all to severe eye-criticism. It is only in this way that the best can be taken and placed, and the worst left and uncriticized." There is doubtless much truth in this view of the question, notwithstanding the sneers with which florists' flowers are sometimes visited.

### \* CALAMAGROSTIS ARENARIA.

SOME grasses which are of little value to the agriculturist have yet their uses, and many of them perform most important parts in the economy of nature as well as supply various wants to which man is subject. This is true of *C. arenaria*, a grass which grows by the seashore, more especially on sand beaches, both in Europe and America, and is known by its strong running roots, harsh leaves and compact spikes of nearly white flowers, which are objects of much interest to the collector of grasses for winter ornaments, as well as to the botanical student. But it is more for its utility in fixing shifting sands, and thereby forming barriers against the encroachments of the sea that it has been esteemed both in Europe and America. So fully has this property been understood that its destruction has long been prohibited by legislative enactments, in some countries in Europe, and I believe measures somewhat similar have been resorted to in this. And nowhere, perhaps, have more favorable results been obtained from planting it than at Cape Cod, where inroads of the sea have in some places been stayed, and the streets of a city once liable to be covered with drifting sand now entirely exempt from this scourge.

But examples of this character are to be met with nearer home, and nowhere, perhaps, in a more striking manner than on the East Haven shore, Conn., where for a distance of about a mile a huge embankment of sand has been reared, just above tide level, and backed by long stretches of swampy flats, which might in some parts be overflowed, or encroached upon by the chafing of the tides, were it not for this natural barrier. This ridge has been formed by drifting sand finding a resting-place among the grass, and as it has increased in height, the grass also has continued to rise and maintain itself atop.

We have also seen this grass performing good service on ancient river terraces where steep precipices lead up from river beds to cultivated fields, which but for the roots being woven into a net work sufficiently strong to keep the materials in place would, from the action of the weather and other causes, tend toward a lower level.

These facts suggest the advantages to be gained by planting the *Calamagrostis* where it does not now exist—on the banks of rivers or other places exposed to the innovations of floods, or where runs might be caused by heavy rain storms. We have also seen sand flats in good neighborhoods which might

be made to look green by the same means, and at some future day so fertile as to produce valuable crops, both for man and for beast. And all this from the operation of causes which have effected great and important changes in the past, not only in raising embankments to arrest the encroachments of tides, but in elevating brackish meadows to a level more conducive to the health and prosperity of whole communities. And so we never look upon such places, bearing their loads of rank grasses and sedges, without being impressed with the greatness of those forces which have hitherto wrought, and will continue to work through all time for the accomplishment, we doubt not, of great and beneficent ends. A. VETROU.  
New Haven.

### MUSHROOM HOUSES AND MUSH-ROOMS.

MR. EDITOR.—Your article on mushrooms was excellent and most seasonable, the points well taken and the advice good; yet, with your permission, I would like to add a few words. No crop is more likely to give satisfaction in a family than a good supply of mushrooms. They can be used in so many ways, their flavor is so grateful in so many dishes, and their culture so easy, that they should be grown by every one who can find room and time enough to attend to them. And if we consider the fact that mushrooms spring up most abundantly on old pastures, more especially in a season like this, while the earth retains its heat and the nights begin to lengthen and become cool, and are highly charged with atmospheric moisture, we have some guide to their treatment under artificial conditions. Without this kind of atmosphere, however carefully the beds are made and attended to, the results will not be satisfactory, more especially as a good deal of fire heat may be required to keep the temperature up to its proper height. The best of all situations, when available, in which to grow mushrooms, are underground caves, such as supply the Paris markets with such vast quantities. [See following article—Ed.] These conditions are a still humid atmosphere, and where a succession of beds is constantly in course of formation, the air becomes charged with ammonia, which wonderfully assists the growth of the young mushrooms. When such situations are not available, the best plan for securing the required amount of humidity is to keep a heap of fresh fermenting manure in it, and frequently turn it over. This will be found superior in effect to any evaporating trough or steaming apparatus, and the beds will continue in bearing for an unusual length of time. The method of making the beds was described so fully that I need not enter upon it further than to say that we mix a good quantity of fresh loam with the stable manure, which moderates the heat and makes it more lasting. A temperature in the beds of 80 deg. at spawning time, and an air heat of 55 deg., we find to suit admirably. Another and important point is a good clayey loam with which to earth up the beds. This should be beaten down as hard as mallet and spade can make it, and wetted so that a smooth spade will slide over it. One of the many advantages of a firm surface to the beds is that the mushrooms form on the surface, and are easily gathered without injury to the bed; but with soil of a loose texture the majority will form on the manure, and cannot be gathered without disturbing the growth of many of the successional ones. J. G.

**MUSHROOM-GROWING IN PARIS.**—Mushroom-growing, as it is carried on in some parts of France, is one of the most extraordinary examples of culture in the world. In the vicinity of Paris are extensive stone-quarries, long since abandoned, from which the stone has been extracted as coal is obtained, leaving extensive caves sixty or seventy feet under ground, and extending great distances, in some instances fairly under the city itself. In these caves the temperature is very equal, and the atmosphere moist; and here mushroom-growing has been brought to its fullest development. The floor of the cave is carefully swept, and the beds are then made of the dust from the stone-cutting yards above, mixed with stable-manure. These beds are about twenty-two inches in height and the same in width, ranged in parallel rows, between which there is just room to walk. The temperature of the bed is carefully noted, during the fermentation of the manure, and the spawn of the mushroom is not sown until it is below 76 deg. Fahr.; since, if it is above this, the layers of spawn are liable to be burnt. The spawn when sown is covered with manure, which is removed as soon as vegetation begins, and is replaced by earth. The details of making the beds, watering them, picking the crop, and renewing the spawn vary in different localities, but the general system is everywhere the same. The mushroom caves at Montrouge, just outside the fortifications of Paris, on the southern side, are reached by descending well-like pits by means of a ladder, which is simply a single pole with sticks run through it to serve as steps. From the bottom of this pit little passages radiate. They are sometimes narrow and often very low, but every inch of available room is made use of, and as many beds are crowded together as possible. Everything is kept scrupulously neat, and no litter is left strewn about, as one would naturally expect. Another type of mushroom cave is to be found at Frepillon, Mery-sur-Oise, where are the quarries for the building-stone and plaster so largely used in Paris. The excavations here are not in small, narrow vaulted apartments. The beds are arranged in rows, in such a manner as to make the most of the space, and here, as elsewhere, the practice of planting a certain number of beds every day in the year is observed, so that the supply is unending. An idea of the magnitude of the mushroom business may be formed, when it is known that one proprietor has twenty-one miles of beds, another sixteen, another seven, and so on, through a long list. Among numerous localities in which the mushroom culture is carried on, besides the two mentioned, the principal are "Monlin de la Roche," Sous Bicetre, near St. Germain, and at Bagneux. These caves, like mines, are under government supervision, and vary in depth from twenty to one hundred and fifty or sixty feet. Coal-mines are not adapted for growing mushrooms, and the smallest particle of iron in the beds of manure is avoided by the spawn, a circle around it remains inert. It is said to be the same with coal.

J. D., St. Louis.—Your ferns are, as far as we can make out: No. 2, *Cyrtomium anomophyllum*; No. 3, *Asplenium lucidum*; No. 4, *Cyrtomium caryotidum*; No. 5, *Polypodium frantifolium*; No. 6, *Polypodium aureum*; No. 7, *Polypodium tetragonum*; No. 8, *Orontium falcatum*; No. 10, *Polypodium tetragonum*; No. 11, *Adiantum hispidulum*; No. 12, *Poly-stichum (Aspidium) proliferum*; No. 16, *Pteris geraniifolia*. The other numbers we are not positive about from the specimens sent. Send better specimens next time.

H. J. C., Milton, Pa.—The Life Plant (*Bryophyllum calycinum*) can be had of almost any florist for twenty-five cents. It is grown only for its being curious, and may not be found in every collection.

## The Kennel.

To CORRESPONDENTS.—Those desiring us to prescribe for their dogs will please take note of and describe the following points in each animal:

1. Age. 2. Food and medicine given. 3. Appearance of the eye; of the coat; of the tongue and lips. 4. Any changes in the appearance of the body, as bloating, drawing in of the flanks, etc. 5. Breathing, the number of respirations per minute, and whether labored or not. 6. Condition of the bowels and secretions of the kidneys, color, etc. 7. Appetite; regular, variable, etc. 8. Temperature of the body as indicated by the bulb of the thermometer when placed between the body and the foreleg. 9. Give position of kennel and surroundings, outlook, contiguity to other buildings, and the uses of the latter. Also give any peculiarities of temperament, movements, etc., that may be noticed; signs of suffering, etc.

### THE FOX TERRIER.

For Forest and Stream and Rod and Gun.

I AM very glad to see that the sporting journals are at last beginning to take an interest in other dogs besides the pointer and setter. There are many gentlemen dog-fanciers who never shoot, but still have a kindly regard for the dog, and it is to these and the members of the Queens Co. Hunt Club, and other fox-hunting associations, I would address.

The pointer and setter, especially the latter, have been so thoroughly discussed in the papers that it would be well to

RATTLER.

have some other variety of dog brought on the tapis, and, if possible, gain as enviable a notoriety as the noted shooting dogs. I do not propose to enter into the direct origin of the fox terrier, simply because I firmly believe he has none; he is what is termed a made dog—that is, a mixture of different breeds and, in this instance, of terriers and beagles. The working fox terrier, or field dog, is used for bolting foxes on a fox hunt—that is, a fox runs into a hole or drain to escape the hounds and it is impossible to dislodge him, so a brace of fox terriers are generally carried along, either by a man walking or riding. Some of these dogs run behind the pack, but this exertion makes them too tired and exhausted for their peculiar work. The dog or dogs are then put on the track of the fox where he entered the hole, the fox terrier scrambles in, and ought to commence baying, barking and turning out the fox, not fighting, as the object is to bolt the fox, not to injure him so that the hounds may continue the run, giving Reynard a little license, or time, to get away. The fox terrier, therefore, should not be large, about 16 to 18 pounds, but must, of necessity, have plenty of pluck, game, endurance and strength—if he is bitten by the fox, of course he is bound to return it. It is almost impossible to train a dog of such thoroughly game qualities not to bite, unless he is carefully entered, that is, educating the pup at first when quite young to show every disposition to murder—without actually committing the deed; for where a fox terrier is a blood biting dog, then his usefulness in the field ceases; for if he does not destroy the fox, he will maim him, most probably, so that he is unable to run, and consequently the hunt must come to an end.

The first fox terrier that I became acquainted with was Tartar, then owned by Mr. Herbert. He was a noted and famous dog in his day, and had a number of owners; a good worker, and a grand sire, as many winners of the bench show to-day claim him as their progenitor. There are a few specimens here, but of a very different character to the above-named dog. "Flitch," a dog owned by Mr. Hume, of Richmond, was the model of a dwarf fox hound in build, and a very likely looking fox terrier. His color was very good, but he lacked the long, powerful jaw, and, as I thought, a little too small; but he was very young when I saw him last at the Baltimore show, and bid fair to make a nice and servicable dog. "Tricksy" is only a fair bitch, much too short in the

nose, from the stop to the tip, and the jaw lacked muscular development. However, I should much like to see her bred to a first-class sire. Mr. Darling and Mr. Griswold own some pups, the latter's, I believe, are in training, but I am informed that the cream of the fox terriers was shown at the London, Ontario, show.

JOCK.

This letter is simply an attempt to interest the public in the fox terrier, so it would be out of my province to enter more fully into the points and other special qualifications of this wonderfully game and intelligent dog. Stonehenge, in his coming work on the "Dogs of the British Isles of To-day," will give all the points requisite. However, as it is well to have as many opinions as possible on this subject, I now place before your readers a letter from W. Cropper Cope, who is one of the oldest breeders, judges and the greatest authority on fox terriers in England. He says:

There is such a diversity of opinion respecting this breed of dog, particularly in the present day, that it is a somewhat difficult subject to enter upon. Few varieties of dogs show greater intelligence than the fox terrier. Capt. Williams, Mr. Merry and Jack Morgan were among the breeders of the earliest and best, and few, if any, have come up to the standard of "Old Jock," bred by Capt. Williams. He was as near perfection as possible, and it is a great question if ever his like, taking him altogether, is seen again. "Venture," "Trimmer," "Old Trap," "Fox," "Chance," and several others, were very good specimens, though not equal to him. "Venture," however, was a grand dog, and after winning a great number of prizes, I sold him to Mr. H. Gibson for a long figure, in whose possession he soon died. "Old Jock" had several masters; he was in my possession longer than in that of any other person, and, after winning an immense number of prizes, he was only defeated on two occasions by a dog called "Tartar" which was anything but a fox terrier, showing a good deal of the bull terrier type. I have owned the very best dogs that have yet been produced, such as "Old Jock," "Venture," "Trimmer," "Fox," "Old Trap," "Ruby," "Grove," "Nettle," "Nectar," and many others. All these have been very successful, and large prize winners, and sorry am I to say that, as far as my judgement is concerned, none like them grace the various benches at our shows. I can only find now a very few approaching them. These are Fletcher's "Rattler," "Little Jim," "Frisky," and Burbridge's "Nettle." Fox terriers like the above-named are very difficult to breed, and it is only now and then that one approaching to perfection is found, and in such cases, commands a very high price. Large numbers are exhibited at various shows, where they are most attractive, and are generally a puzzle to the judges who have to decide on their merits and demerits. The fox terrier dog should not exceed 18 lbs.; a bitch, 16 lbs.; his principal requirement being to enter any earth or drain to bolt a fox. It is of consequence that he should be of good constitution, being continually exposed to wet and cold. Courage and determination are essentially requisite, enabling him to endure punishment. He is not wanted, however, to draw the badger, but to go to ground and bay at, not destroy, a fox in his earth; consequently, he must not be too sharp. He is a distinct family, and ought to destroy vermin without the bull dog cross. The forehead must be lower than that of the pointer; the head lengthy; nose, pointed, long, and tipped with black; ears, short and thin, dropping close to the cheek; well-formed jaws; strong teeth, level neck, rather light back, lengthy, strong loin, showing ribs, round back, ribs deep, thick set, not wiry; stern fine, and must not curl, coat smooth, thick set, not wiry; as to color, there is a wide difference of opinion; that most preferred is white, with markings of black and tan or black—brindled is certainly objectionable. Points:—Head and ears 10; nose, 10; jaw, 5; eye, 5; chest and back, 10; shoulders and neck, 15; hind quarters, 10; legs and feet, 20; symmetry and color, 15.

Stonehenge's points are similar to these, and do not differ materially. The fox terrier best talked about at the present time is the extraordinary bench show winner, "Rattler," a champion of champions, whose portrait appears above. He is owned by Mr. Fletcher, of Manchester, England, to whom I am indebted for the photograph, and other interesting matter as follows:

Anything like a good fox terrier dog fetches now from £50 to £100. I have refused £180 for "Rattler," and my best bitch was claimed at the last Birmingham show for £100. You will not be able to obtain a medium, either a dog or a bitch, for much less than £25 or £30. "Rattler" was pointed to a scale of measurement, and was bred by Mr. Luke Turner, of Nottingham, England, and has won 140 first prizes since he became my property. Every time there has been a prize offered for the best dog in the show, I have always won with "Rattler," beating every other breed of dog, a feat never before accomplished by a fox terrier. Fox terriers are now the leading and most fashionable classes in England, but there are very few that can be called first-class, and £100 is only an ordinary figure for what is termed a champion dog or bitch.

Gentlemen dog-fanciers must not be alarmed at these prices, as we cannot, all of us, own "Goldsmith Maids" or "Ten Broecks," yet there is a possibility, and probability, that we

can breed as good dogs as "Rattler" and "Jock." These grand sires and grand dams never cost more than £10, or \$20 each, so that the raging fashion for fox terriers in England is similar to the pure black fox pelt, which is worth, anywhere, from \$100 to \$350, according to its size, color and length of hair.

The fox terrier is gradually coming into fashion in this country, but it will be some time before he gains the notoriety that he has done in the Old World; and I can assure you, who fancy this breed of dog, that good specimens can be purchased of reliable gentlemen in England, at from £15 to £20 or even a trifle less.

JOHN M. TAYLOR.

The "Retreat," Bellefonte, Pa.

### CANINE THERAPEUTICS.

#### TONICS.

THE word tonic is derived from a Greek word signifying stretch, and by a figurative allusion to a stringed musical instrument, the cords of which do not give out proper sound unless made duly tense, tonic remedies may be described as those which gradually produce the requisite degree of tension of the nervous system, or generally of the muscular fibre, and which enables it fitly to respond to all of its natural and appropriate stimuli. The idea of tension is inseparably associated with all our notions of vital force, because, as is common, if not the only, conception we possess of organic power is derived from our experience of the phenomenon of muscular force, which is always displayed in connection with the tension of muscular fibre.

All exhibitions of force in the animal economy involve elements, a vital and an organic element; the former of which represents the power, the latter the mechanism by which the power operates. The organ may be fully developed and sound, but the power to move it may be defective; or, on the other hand, the vital activity may be unimpaired or even exaggerated, but, from defective nutrition, the organ may be unable to manifest the power which is expended in it. In the ly, neither of these elements may possess the requisite degree of development; the organ may be imperfectly nourished, and, at the same time, the vital force may be wanting, and is required for the performance of its functions.

For these morbid conditions nature has bountifully provided remedies: stimulants to excite and tonics to strengthen, as if with an intelligent anticipation of the needs of the system, a third class of medicines, which combine the virtues of the other two. Not altogether different in their essential nature, tonics and stimulants do not exclude, but are complementary to one another—the former developing the organic nutritive element, the latter the dynamic, nervous, vital power. According to the necessities of each case of disease, we may employ an exclusively tonic or an exclusively stimulant method of treatment, or combine the two, associating representatives of each class, or prescribing in which tonic and stimulant virtues are united in different proportions, and which may be called tonic stimulant or stimulant tonics, according to the quality which predominates in each.

Comparing pure tonics and pure stimulants with each other, we are struck with the remarkable difference between them, that while the influence of the latter is transient, the former is comparatively permanent. Stimulants, upon the nervous system, rob it of power by their very action, and, unless the loss were made up by external aid, would soon exhaust it completely; but every tonic, under due conditions as regards nutriment, adds to the strength of the system in a slow and gradual, but permanent manner. Nevertheless, tonics are stimulants of the nervous force, and, as we shall see, produce some of the worst effects of stimulants when employed too lavishly, and not in proportion to the susceptibility of the stomach and nervous system. Stimulants are also virtually tonics, inasmuch as means of their power over the intensity of organic action, they enable the stomach to digest food which, without aid, would be only burdensome and irritating.

Besides the groups of tonic remedies just mentioned, there is another, which may with propriety be called sedatives, because each member of it presents peculiarities dependent upon its essential nature, or upon its association with an organ possessed of specific powers. The most important and the most inappreciable, and those of its preparations which are administered with a view to this effect owe whatever they may have in promoting it to the acids with which they are combined. A more correct denomination for them would be that of a nutrient medicine, for its presence in the blood and in the solids, also, it is quite as essential as in the fluids of ordinary food to the performance of a true tonic. Cinchona possesses the virtues of a true tonic, and that in a high degree, but its most eminent virtue depends upon quinia and the other alkaloids which it contains, and which impart to it anti-periodic virtues. The marked action of quinia upon the canine economy is such that it has a direct sedative influence upon the motor power of the heart. With dogs it is less valuable as a tonic than carbozato of ammonia, and other alkaloids, as it is as combined with quinia. The same may be said of bark and dogwood as of cinchona, although the specific properties in them are quite feeble, so much so as to lead to declare that they do not exist at all. Finally, while bark contains a bitter and tonic principle combined with a direct sedative, hydrocyanic acid, and affords, in the only example of this association (except quinia), apparently antagonistic virtues in the same substance.

Bitter tonics, as those vegetable productions which owe their tonic properties to their bitterness, if administered short time before meals, excite the appetite and the debilitated stomach capable of digesting a greater quantity of food than it could otherwise dispose of. Consequently, their influence, and provided that secondary actions are not impaired, the muscular strength becomes increased, and all the operations of the economy are more vigorously performed.

The nature of the action excited by vegetable tonics on the stomach is not well understood; but a consistent study of their effects under different circumstances renders it probable that they act as irritants. For if they are used in

(the choicest fish morsels I have ever tasted. That engineer had killed and cleansed and then cooked a mackerel on his boiler fire. It was delicious, certainly; that mackerel was telegraphed from the briny ocean into a *terra incognita* in less than ten minutes.

In two more hauls we had upward of 5,000 mackerel on board, and if it had been worth while, I believe we could have sunk the steamer with fish, so plenty were they. The Captain held a confabulation with his men, and concluded it would be wisest to steam up quickly for a market, inasmuch as other smacks were having similar good luck. He knew the price would be lower every minute. There might be the chance of some one getting in before him, so he gave the order, "Let her jump for Newport," where we arrived shortly, and sold out at six dollars a hundred. The fish were purchased by a Philadelphia dealer, and boxed off that same night per the palace steamer Bristol for New York.

My "fish story" is finished, and, unlike many that have been told, every word is true. S. O. M.

—Prof. H. O. Yarrow, of the Smithsonian, has sent us a list of 107 species of fishes, which have been collected by Dr. Ellitt Coues and himself in the harbor of Beaufort, North Carolina. Comparatively few of them are eaten. One of the fishes used as food is the spotted flounder, which is captured by the following method:

It is a peculiarity of the flounders to approach the shore at night and bury themselves in the sand, leaving only the snout and the eyes exposed, and the fishermen, being aware of this fact, are enabled to capture very many in the following manner: A canoe is prepared with a grating or pan in the bow, to contain fat pine, which, being lighted, the boat is propelled slowly by a person in the stern, while another, armed with a spear, stands in the bow behind the fire. The craft is made to approach the shore closely, and as the eyes of the fish reflect back the firelight, they are easily seen, and the spear is driven into the sand a few inches behind the point where they appear. Hundreds of fishes are taken in this manner. In some instances the fisherman simply walks along the shore, carrying in his hands a torch and spear. This species is considered excellent food. Size, from one and a half inch to nearly twenty-eight and a half inches, the size of a specimen obtained in September, 1871.

## THE MEGANTIC REGION.

EDITOR FOREST AND STREAM:

SOUTH HAM, P. Q., Oct. 26, 1877.

Many items from the Megantic district have from time to time appeared in your columns, but no mention has been made of Wolf county, which forms the northwestern part of the Megantic county and presents a good field for the sportsman. The county town of Wolf is "South Ham," a small backwoods village containing two dwelling-houses, one church and a court house, all pleasantly situated on a rising eminence near the centre of the county. One of the aforesaid dwellings is the residence of E. S. Darche, Esq., who is store keeper, postmaster, county clerk, register, magistrate, etc., etc. The other dwelling is occupied by its owner, Mr. F. G. Goodenough, hotel keeper and farmer. From the veranda of this hotel looking westward one gets a fine view of a wide expanse of almost unbroken wilderness, with Orford Mountain looming up in the far background and the range of Stoke Mountains at the left. A short mile to the right and north of the hotel brings you to the foot of Nicolet Mountain. Around the base of this mountain and stretching away to the north and east are the Nicolet woods. Ruffed grouse, deer, bear, caribou and most of the fur-bearing animals are quite plenty here. The woods would be alive with deer (I large numbers of them were not killed by the "Canuck" during the deep snows in the months of February and March which considerably lessens their numbers. But arrangements are now being made so that, through Mr. Darche, the strong arm of the "Province of Quebec Fish and Game Protection Society" will reach these "pot-hunters" and teach them a summary lesson which will undoubtedly, in a great measure, put a stop to their unlawful practices.

A drive of six miles from the hotel into the Nicolet woods takes you to Lake Nicolet, a most beautiful body of water some four miles long by three-fourths of a mile in width. This lake is the head of Nicolet River and is fed wholly by springs, and its waters almost rival in clearness those of that fabled lake whose waters are said to be so transparent that it is impossible to perceive where the dividing line is between the water and air. There are several islands in this lake; the largest rises near the centre of the lake—a high rocky pinnacle very like a miniature St. Helena. The sight presented to the beholder standing at the upper end of the lake, looking down its length taking in the islands and further down the different peaks of the mountain, all towering above the clear, silvery water which, mirror-like, reflects back their every form with marvelous distinctness, makes a picture that, once seen, will never be forgotten.

The *Salmo fontinalis* is the only variety of the fluky tribe found here and they grow in goodly numbers and large size, though they also suffer much from the depredations of the poaching Frenchmen who with their night lines and gill nets take bushels of them from off their spawning beds. There are other lakes in this immediate vicinity—Indian Lake, Branches Lake, East, Trout and Duck Lakes. All of these contain the *Salmo fontinalis* and some of them the silver lung (*Salmo maculatus*). Besides these lakes there are numerous streams and some of them of considerable size, being branches of the Nicolet River. One of them is quite near to the hotel that contains trout, and would furnish good sport to the fly fisher during the early part of the season before the myriads of chubs appear.

There are two routes to reach this place; one by Grand Trunk R. R. to Danville, then twenty-six miles by stage. The other route, take the International R. R. from Sherbrooke to Weedon, then drive twelve miles over a rough road. The deer here are quite unsophisticated, as they have never been run by hounds, or hunted by the still-hunter during the autumn and early winter. The writer is just returning from a trip through this country and has seen large numbers of grouse, and one morning he shot sixteen ducks, black scoters, thirteen mallard and three female, out of a flock that had settled in a small pond near "Bury." Is it not unusual for a variety of sea duck to be found so far from the sea coast? I would call the attention of Vermont sportsmen to the fact that pot-hunters from Coolbrooke and neighboring border towns here in Canada (some of them wealthy men) are now daily visiting "Averil" Lake and are killing hundreds of large trout, using both night lines and gill nets. The Vermont Fish Commissioners should stop this at once or the lake will soon be cleaned out. STANSTEAD.

NOTICE TO SPORTSMEN.—Having received so many communications asking us for information in regard to our six-section bamboo trout, black bass, grise and salmon rods, we have prepared a circular on the subject, which we shall take pleasure in forwarding to any address. We keep on hand all grades, the prices of which range from \$15 to \$150. We put our stamp only on the best, in order to protect our customers and our reputation, for we are unwilling to sell a poor rod with a false enamel (made by burning and staining to imitate the genuine article) without letting our customers know just what they are getting. P. O. Box 1,294.—(Advt.) ABBEY & IMBRI, 35 Malden Lane.

## Game Bag and Gun.

### GAME IN SEASON IN NOVEMBER.

"Bay birds" generally, including various species of plover, sand piper, snipe, curlew, oyster-catcher, snail birds, phalaropes, avocets, etc., coming under the group *Limicola* or Shore Birds.

The quail law of Ohio is not out till November 15.

VERMONT.—*Alburgh*, Nov. 2.—The bays are full of ducks. Partridge shooting excellent. The birds are unusually tame, and are found near the farm buildings.

MASSACHUSETTS.—*Framingham*, Nov. 2.—Ruffed grouse are about the only game hereabout this fall, and those far from abundant. F. brought in six yesterday, an uncommon good bag. He reports seeing but one woodcock, and nary a quail. The latter haven't been so scarce for years. I doubt if there were a dozen broods raised in the whole township. The universal opinion is that the severity of last winter was too much for them. It is to be hoped that the attempt to introduce the migratory species will be a success, otherwise quail shooting in N. E. will soon be a thing of the past. The fox is also getting to be rather a "rare bird" with us. One was brought in last week after a long run and considerable shooting. Wild geese passed yesterday. A few went over ten days or so ago. F. C. B.

SALEM, Nov. 3.—The lawful quail season opened last Thursday, but owing to defective laws and unscrupulous gunners the birds in some places are pretty well scattered. Woodcock very scarce. Partridge shy and none too numerous. Some snipe and rail yet at Newbury. Sheldrakes, coots, loons, capebraus, old squaws, blue bills, dippers, whistlers, etc., are now in order to shoot, but they are all careful birds, and generally look out for number one. I have a young European quail, shot the first, near Essex Ponds. This is quite a nice bird to take, as it proves the birds put out by Boston, through Salem parties, near our reservoir, have been mating and breeding. Kittiwake gulls very numerous in the bay, and quite tame.

RHODE ISLAND.—*Newport*, Nov. 5.—The ground is in splendid condition. There are plenty of rail and waterhens. Snipe are quite plentiful. There are a few yellow legs left, and we are visited quite often by ducks and coots. Quail are abundant in our neighboring vicinity. Bagged two rails, one snipe, two yellow legs and five creckers. NIMROD.

CONNECTICUT.—*Norton*, Nov. 6.—Quail are abundant here this fall. Grouse scarce and very wild. Ducks are very scarce on account of the late fall, but are very tame. One man bagged sixteen woodcock in one morning last week. F. K. G.

NEW YORK.—*Rochester*, Nov. 1.—Duck shooting on the Grecian ponds will furnish fun until the ice closes the ponds. The editor of the *Union and Advertiser* concludes that "duck shooting is a source of great emolument to the dealers in ammunition, for scarce a man of the fifteen or twenty who are stationed on the bar but discharges both barrels of his gun at every flock that passes, no matter how far away they are. This scares the birds, but seldom hurts them, and the waste of powder and shot is enormous. If the shooters would abstain from firing at the birds when out of ordinary range, they would not be so wild, and in the end more of them would be shot. But it is impossible to get all to agree on that point, for when one shoots nearly all the others near him seem impelled to rise and blaze away."

BUFFALO, Oct. 26.—Woodcock has been rather scarce, but the birds are in excellent condition, averaging seven ounces. No heavy bags have been made thus far by any party. Partridge are abundant, and have been offered freely at 75 cents a pair in the market. All of the birds are in better condition on an average than during the previous year. The neighborhood of Buffalo enjoys a fine supply from the stragglers of the near-by spurs of the Alleghenies. It seems to be a settled fact that partridges do take short migratory flights whenever their customary food becomes scarce in their usual haunts. Snipe has only appeared in small flocks and has afforded scarcely any sport. Bags above ten are an exception. The dry weather in September and early October seems to be the reason of their unusual scarcity. Coots (alias ruddy ducks), Scotus, pintail and teal have made their appearance near middle of October, and have afforded here and there fair sport. The great amount of tugs, steamers and other craft plying on the rivers acts as a check upon the usual supply of water fowl on the Niagara. A large wild cat (*Lynx canadensis*) was shot last week in a swamp within fifteen miles of Buffalo. The still ferocious looking animal has been sent in flesh to the rooms of the Buffalo Society of Natural Sciences, where it will be in due time added to their collection after being mounted. The weather is now on the main unfavorable to hunting, since rainy days are in excess. Buffalo sportsmen prefer the Western plains to their neighborhood, and are mostly away from town.

BLOOMINGBURGH, Nov. 3.—The shooting still good. Miller and myself killed 29 woodcock and 4 partridges Wednesday, 12 woodcock and 3 partridges Friday, 6 partridges and 3 woodcock Saturday. Partridge shooting fine here this fall. MILLO.

Union Springs, Nov. 2.—The slaughter of ducks has been so great that the use of batteries is no longer allowed.

Soleheneady, Nov. 8.—Good duck shooting in Sanders Lake, and all along the Mohawk River. They only began to arrive last week, and since then have come in large flocks. C. W.

PENNSYLVANIA.—*Slade*, Nov. 5.—The woods in the vicinity are full of wild turkeys and pheasants.

Clearfield, Nov. 1.—Pheasants are still abundant in the woods, but there are too many gunners out.

Lancaster, Nov. 2.—I have just returned from a gunning trip to Fayette County. Quail were very abundant; also pheasants. Deer and turkey reported on mountains, but I didn't find them. F. A. D.

Hornellsville, Nov. 5.—Not much sport of any kind last week, on account of the bad weather. On Thursday last a fine deer was shot in the village, within one-quarter of a mile of the post office. It was discovered feeding among a number of cows; weighed 200 pounds. J. O. F.

VIRGINIA.—There is an abundance of game this season. Deer, turkey, ruffed grouse, partridges, hares and squirrels are quite plentiful, especially the last named, which are more abundant in the Shenandoah Valley this season than has been known for many years past. For several weeks past squirrels have been invading the valley in vast hordes, their migration being probably due to a scarcity of moss in the Allegheny Mountains. It is certain that some of these animals have come from the Alleghenies or points further West, from the circumstance, that among others, many black squirrels have been killed, which are not residents of the valley.

Leesburg, Nov. 3.—The present season for quail opened on 1st Nov., four gentlemen killing sixty-five, two other same day, killing thirty-nine, and on Nov. 2 still another pair shooting thirty-one. Ten or twelve sportsmen heard from averaged fifteen birds apiece. The birds are well grown and rather abundant. No fishing, water not clear. Weather cool, but not cold. T. W.

Norfolk, Nov. 5.—Bob White's protection papers have been withdrawn and he must look out for himself and family. Thursday, Nov. 1 ushered in cloudy, but a great many ardent sportsmen were out and made some very good bags, the best reported scoring forty-three. Have not had any frost to date down the weeds, which are breast high. Ducks are flying over pretty well, and with the advent of cold weather, Quail will be sending a good many in. W. H. S.

THE FIRST QUAIL IN VIRGINIA.—Mr. Page McCarty, of Richmond, Va., writes to us as follows:

The President's son, Mr. Webb Hayes, bagged the first quail of this season near Richmond, on Nov. 1, which is the day on which the sporting Virginia is allowed to take out his breech-loader and indulge his favorite sport. The scene of Mr. Hayes' first experience in a field of the Old Dominion, was just above Richmond, along the valley of the James River, where the rich autumn fields are always full of birds, where the sport is peculiarly fine; where the bevy is scattered and the sportsman can pick up single birds. While His Excellency, the President, went out to a breakfast party, his son, with a pleasant company of jolly Virginians, some hunters and ammunition of more kinds than one (he has hoped, took the field and declared a very handsome dividend of partridges, as the F. F. V.'s call the bird.

[We are glad to hear of Mr. Webb Hayes' good fortune. We sincerely trust that at future dinners or suppers at the White House no game out of season will be served. We occasionally had a bone to pick with President Grant on the subject, but since Mr. Webb Hayes is a sportsman he will undoubtedly attend to such matters, and not allow violation of the game laws.—Ed.]

STEAMER BETWEEN NEW SMYRNA AND ST. AUGUSTINE, FL.—The steamer Border City will make semi-weekly trips between New Smyrna, St. Augustine and Jacksonville, connecting at the latter place with a line of steamers to Savannah, thence to New York. The fare to New Smyrna from St. Augustine is \$3, and from Jacksonville \$6. Wm. H. Clark, Gen'l Agent at Port Orange; John Clark, Agent, Jacksonville. This line will enable sportsmen to go from New York direct to New Smyrna.

MISSISSIPPI.—*Corinth*, Oct. 31.—I think there is a fair crop of quails this season, and hope to commence shooting as soon as the frost kills down the weeds and grass. Turkeys are more numerous than usual. We have had very few squirrels this fall, although there is an abundant mast. Weather magnificent, bright and warm. GUYON.

TEXAS.—*Wills*, Oct. 29.—Weather warm for the season, and but few wild fowl south yet. Mast crop very good, some anticipated; no end of game later. Deer in splendid order, and we are getting quite a number.

OHIO.—The quail season does not open until Nov. 15.

—Of course the St. Clair Flats must be a good place for ducks. How do we know? Because we beg to acknowledge from S. H. Turill, Esq., a dozen of red-heads and canvas-back ducks. Never were birds fatter or better.

—We beg to acknowledge from D. A. Merritt, Esq., Vice-President of the Black Hawk Club, the receipt of earlier invitation to partake of the hospitalities of the club. The officers of the club are G. W. Esterley, President, of White water, Wis.; D. A. Merritt, Vice-President, Marquette, Mich.; and W. S. Dalleba, Secretary. The election took place Oct. 12. From the Jefferson County Union of Atkinson, Wisconsin, we learn that General Phil. Sheridan has been a guest of the Black Hawk Club. Attracted by the beauties of Lake Koshkonong this gallant officer has visited it several times for sport and recreation. The club has our best wishes for its success. Formed as it is of gentlemen sportsmen, we trust to be reminded from time to time of its prowess in the field.

NEBRASKA.—*Omaha*, Oct. 29.—Snipe shooting is good this season; rather better than usual. Duck shooting not so good. The ducks have not come down from their northern haunts as yet. Geese are moving southward, many congregated upon the sand-bars of the Missouri and Platte rivers, in the vicinity of the feeding grounds. But no considerable numbers have been brought in by our sportsmen as yet. The bag of snipe of this season was made by your humble correspondent and two others in one day last week, consisting 133 Wilson's snipe, in the Papillon Valley (French for butterfly, locally pronounced Papio), eight to ten miles from the city. The day was cold, and the birds wild enough to make the shooting interestingly lively, usually rising from thirty to forty yards from the shooter. Our pleasant autumn weather bids fair to extend the fall shooting on ducks, geese and snipe somewhat later than usual, and as these are the only birds we are permitted to shoot in this State, the boys propose to go for them. Bob White.

—The Emperor William is a crack shot and enjoys the sport now as much as in his younger days.

All the shells were loaded precisely the same as near as I could load them, with one black and one pink edge was over powder, and one black edge was over shot. I have no comment to make on the relative merits of either shell, the figures stand for themselves. I could see no difference in the recoil of the paper shells. I think the reliability of the Bridgeport paper shell is worthy of mention, having used a large number in the past three years without having one misfire. I can't say as much for any other paper shell I ever used.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INOCULATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company.

-AT-

No. 111 (old No. 103) FULTON STREET, NEW YORK.

[POST OFFICE BOX 2832.]

TERMS, FOUR DOLLARS A YEAR, STRICTLY IN ADVANCE.

Twenty-five per cent. off for Clubs of Three or more.

## Advertising Rates.

Inside pages, nonpareil type, 25 cents per line; outside page, 40 cents. Special rates for three, six and twelve months. Notices in editorial columns, 50 cents per line.

Advertisements should be sent in by Saturday of each week, if possible.

All transient advertisements must be accompanied with the money or they will not be inserted.

No advertisement or business notice of an immoral character will be received on any terms.

\* Any publisher inserting our prospectus as above one time, with brief editorial notice calling attention thereto, and sending marked copy to us, will receive the FOREST AND STREAM for one year.

NEW YORK, THURSDAY, NOVEMBER 8, 1877.

## To Correspondents.

All communications whatever, intended for publication, must be accompanied with real name of the writer as a guaranty of good faith, and be addressed to the FOREST AND STREAM PUBLISHING COMPANY. Names will not be published if objection be made. No anonymous contributions will be regarded.

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions.

Nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for dereliction of the mail service if money remitted to us is lost. NO PERSON WHATSOEVER is authorized to collect money for us unless he can show authentic credentials from one of the undersigned. We have no Philadelphia agent.

Trade supplied by American News Company.

CHARLES HALLOCK, Editor.

T. C. BANKS,

Business Manager.

S. H. TURRILL, Chicago,

Western Manager.

—We had the pleasure last week of a call from Profs. Baird and Gill, of the Smithsonian Institution; Commander L. A. Beardslee, of the United States Navy, and Major Ferguson.

MISSOURI, KANSAS AND TEXAS.—The *Great Southwest*, a journal published by Jas. D. Brown, Esq., in the interest of the M. K. and T. railroad, copies a page of information from "Hallock's Gazetteer," respecting the game to be found along its line. Nine counties are included. We have enjoyed some fine hunting through this domain. For quail and prairie fowl it can hardly be excelled.

STEALING AN ELEPHANT.—We all know how sad a person that proverbial gentleman was who found "an elephant on his hands." We are aware also that the misery was not of his own making; the creature was *given* to him. This is why a sympathetic world sheds tears over his misfortunes. But what tears have we to mingle with the remorseful overflow that would be certain to attend the possession of an elephant that was *stolen*? We cannot conceive of a foolhardiness which would tempt Divine Providence by stealing an elephant, and yet the crime has actually been committed. Only last Thursday four men endeavored to spirit away one of the performing elephants of the London Circus, now exhibiting at Gilmore's Garden, in Twenty-seventh street. Shades of all the Pachydermata, defend us!

ERNEST MORRIS.—This young naturalist, whose South American explorations have deservedly attracted much attention among scientific bodies, and Mr. E. P. Rand, the well-known botanist of Boston, sailed from this city last Friday on the ship Jacob E. Ridgeway, for Brazil. It is their intention to make an extended tour of exploration of the valley of the Amazon and its southern branches. The pluck displayed by Mr. Morris in his previous expedition, and the success which crowned his efforts in the face of seemingly unsurmountable obstacles, lead us to anticipate from his present tour valuable results. His many friends will learn with pleasure that the expedition is undertaken under the most favorable circumstances; and the young explorer returns to his work bearing with him the sympathy and well wishes of many newly found friends.

## SHALL THE CENTENNIAL RIFLE MATCH BE ABANDONED?

THE question which is agitating the rifle world at the present time is, what shall become of the Centennial trophy?

The National Rifle Association have expended some \$1,500 on this elaborate and characteristic prize, and it has certainly been offered by them as a prize to the riflemen of the world as a true emblem of the championship. In fact, everywhere, it is the acquisition of this great trophy toward which all riflemen aspire.

On the first occasion it was contested for by teams from Ireland, Scotland, Canada, Australia and America, and on the second occasion by a joint team, representing Great Britain and Ireland against America. On both occasions the Americans were victorious and we now hold the trophy, and with it the championship of the world. The English portion of the unsuccessful competitors in the last match now insist that no other team should hereafter be allowed to compete for the trophy, except a single one representing Great Britain and Ireland. They are perfectly willing that Canada, Australia and other colonies should send separate teams, but they positively refuse to allow either Ireland or Scotland to do so, in which, by the way, they seem to concede their position to be untenable. The National Rifle Association had met this difficulty in a proper spirit by declaring that if these countries can agree among themselves to have a joint team, it would be received. If separate teams are sent they will also be welcome. The N. R. A. have even gone so far as to say "that a joint team will be received, even if Ireland or Scotland should send a separate one." This, certainly, is liberal to the last degree.

It is plain that the chances of America winning are less if a number of teams are in the field than where there is but one, and it rests with our adversaries to decide for themselves what they will do. But this is not satisfactory, apparently, because it looks as if the majority of the Irish members of the team would decline becoming members of a joint team. It is, therefore, now proposed to organize an entirely independent match, which shall be open alone to teams from Great Britain and Ireland. This is simply a plan to do indirectly what it has been found cannot be done directly. Its practical effect would be to abolish the match for the Centennial Trophy, and to cause perpetual heart-burnings and bickerings between riflemen at home as well as abroad.

The American people will not be prone to forget that Ireland was the first country that organized the system of international rifle matches, or that American riflemen visiting that country were welcomed as the friends of the nation, and received hospitality and honors never before extended to any private individuals. It does not seem likely, then, that American riflemen will consent, under any circumstances, to the organization of an international rifle match, in which Ireland will be shut out from the opportunity to compete, providing she desires to do so.

There are other difficulties connected with the proposed competition. Either this new match is to be greater than that for the Centennial trophy, or it is not. If it is, the latter will soon degenerate into a small affair, and foreign teams will not trouble themselves to engage in it. If it is not, it can hardly be of sufficient importance to justify either America or Great Britain participating in it. As a matter of course it is to be a match for the championship; yet how will it determine that question? If America sends a team to Wimbledon to shoot at the meet of the English N. R. A. in July next, and America is defeated, the English will claim the championship. If the American team wins the match for the Centennial trophy, to be shot in America in September, America will claim the championship. Who is to decide between them?

America now is the champion. She has provided an annual contest in which the validity of that title of champion can be determined. Why should she now now lay aside all this advantage, and organize another match, not to suit herself, but her unsuccessful competitors?

## NATURAL HISTORY AND GEOGRAPHY.

SOMETHING very curious is the effect natural history seems to be having on the localizing, as it were, of lands or continents, which have long ago disappeared. To make this matter plain, suppose we assume an imaginary case. Take an island much nearer to Africa than to Asia, and say that on this island certain forms of mammals are discovered which are identical with those in Asia, and of which none exist in Africa. Now, although the island may be closer to Africa than to Asia, the probabilities are that at some far distant time there was a continuity of land, or at least a range of islands extending between Asia and the present island. It would be difficult otherwise to explain the presence of such forms. Of course to a certain extent this is theoretical, but still when deep sea explorations show that between certain points the bed of the ocean is higher, it may be supposed that in past ages some gradual depression took place, and that what is an isolated island now is nothing more than the highest portion of a continent or of some lofty island, which alone has kept above the surface of the waters. To bring now a case in point. Zoological considerations, together with the fauna of Madagascar, approach much closer to the Asiatic types than to the African ones. But Madagascar is much nearer to Africa than to Asia. In a recent work on the birds of Madagascar, that distinguished ornithologist, Dr. Hartlaub,

points out this assimilation of types to the Asiatic ones. Madagascar is then supposed to have been either once united with India, or to have formed the extreme western island of an archipelago, which once stretched out far to the eastward. It is even thought necessary to give these lost lands a name, and that of "Lemuria" is proposed. A very pretty idea of a similar character was agitated some time ago in regard to the strange habits of the Lemming, a little rodent, which at times is the pest of Norway. Now the lemming seems to have a positive instinct at certain seasons of the year to march directly in a northwestern course. Nothing will stop him; neither the lakes nor fiords of Scandinavia. Millions are drowned in the rivers, still they drive blindly on toward one direction. Arriving at the brink of the ocean, this does not stop these little creatures. In they plunge and all perish. Now come in a very ingenious supposition. A learned natural historian argues as follows: The original lemmings had implanted in them the instinct of migration, and in former ages were in the habit, during certain seasons, of seeking some land far to the westward of Norway. In this distant country either the lemmings found food or the conveniences for rearing their young. It is this same instinct, ever perpetuated, that impels their descendants to follow out the same course. The final destination of the primitive lemming might have been Iceland, perhaps Greenland. The theory then is that in former ages the present northwest coast of Europe was joined either by Greenland or by some land to Iceland, and that submergence has separated to-day the Old from the New World.

## VACATION RAMBLES IN MICHIGAN, WISCONSIN AND MINNESOTA.—No. 4.

BY THE EDITOR.

NOVEMBER 8, 1877.

## FELLOW EDITORS:

I am convinced that your printer believes that "what is worth doing at all, is worth doing well," for I find in my letter of Nov. 1st, line 31st, that he has cooked my goose "artificially." I did wish to have it done *artistically*; but perhaps it makes little difference to the goose now. (By the way, that goose was a duck).

Other changes from my original manuscript are more serious. For instance, I intended that my directions to sportsmen visiting northern Michigan should be so explicit that none should go astray who followed them; yet, when I write "northeast," the printer sends them toward the equator, and when I write "southwest," he directs them toward the north pole! Now, if any readers of my letter should become lost during their rambles and die in the woods, you can imagine whose funeral the surviving relatives will contract for next. Meanwhile, the derelict printer will live on to play havoc with the types and tamper with the "devil," whose services he continually courts! I am now better able to appreciate the indignation of such of your correspondents as complain that their sentences have been mangled and their meaning distorted in transit from the quill-driver to the press. Before, I could hardly realize the burden of distress they occasionally throw at our feet. Verily, it is hard to see "the rain fall upon the unjust as well as the just"—unless there comes a shower as abundant and discriminating as that which drove Noah into the ark for safety. Then there is comfort for those under cover.

N'importe! Let us back to Petoskey, on the Michigan shore, where the quiet summer sea reflects the unclouded blue of the sky above it. The glow of the morning sun is on its bosom and flashes into the eye with a blinding gleam. There is no ripple on the surface, and one can look down through its translucent depths and see great rocks on the bottom, and big Mackinaw trout swimming twenty feet below. If we are out in a boat on the bay and look in toward the land, we perceive that the village of Petoskey occupies a series of picturesque undulations that spread out on either hand and rise to the rear in the form of an amphitheatre. A lofty limestone cliff flanks the town on the east. Its top is crowned with trees, among which are discovered the tents of many vacation tourists who are camping out. Behind them rises an over-topping eminence, dotted with pretentious villas of wealthy residents. From the verge of this cliff the outlook is superb. Opposite, and five miles distant, is the ridge of hills that line the opposite side of the Little Traverse Bay. These sweep round in a symmetrical curve to the head of the bay two miles to our right, and then follow the hither shore until they rise and terminate in the cliff on which we stand.

All along in that direction, as far as sight can reach, we can trace the white line of the pebbly shore lined against the green of the hills; and then from the base of our cliff it continues in a sweep of two miles or more to the left in the form of a crescent, and ends in a wooded point. Tree-covered hills slope gently back and upward from the beach, and pretty cottages peep out from among their branches. The principal part of the town lies in the bowl of the amphitheatre, from which a practicable road leads through a ravine to the long pier which projects from the hollow of the crescent into the bay. This pier gives additional character and life to the scenery. Not far from the road Bear River debouches. Its sparkling waters flow out of Bear Lake a few miles inland, where Mr. Hughart, the president of the Grand Rapids & Indiana Railroad, has his family shooting-box. There are trout in the river, but a small mill located just where the river flows into the lake has driven them from the vicinity of Petoskey, where they were numerous five years ago. Both mill and dam are suffering from neglect, and we may remark, by

way of encouragement to ardent anglers, that the latter is a dam site nearer dilapidation than the former.

As we have intimated, the town is the growth of about five years. The railroad, with its steamboat connections on the lakes, has built it up. The stores and dwellings are chiefly of two or three stories, neatly painted white. Plank sidewalks are constructed all over the town. There are two excellent hotels of three stories in height, with inviting piazzas for mid-summer shade, having creditable stables attached. One is called the "Occidental," and is kept by Mr. Bradley; the other, the "Cushman House," by the Cushman brothers. The table at each is good, but I think that friend Bradley is apt to institute a good dinner at the expense of the other two meals. An average adjustment would suit better. There are, besides, several very desirable boarding-houses; also a bank, a news-room, a cottage bowling-alley near the cliff, several well-kept billiard rooms and restaurants, good barber-shops and various other institutions for useful service or amusement. The railroad depot and shops, with the coming and going of daily steamboats, stages and trains, with an occasional coastwise vessel at the pier, give a business bustle to the place that is quite exhilarating. Upon the whole the *tout ensemble* is metropolitan. Shade trees have been profusely set out where needed, and the nucleus of a Methodist camp ground has been formed, the railroad company having donated several hundred acres of land near by, on which a few cottages have already been built. What is already done has been well done, and the impression one receives is the probability of substantial permanence if not extended growth. Central town lots are held at \$1,000 each and upward. One contemplated public improvement is the erection of a lamp post and lantern near the town pump, which is located exactly in the centre of the sidewalk on one of the most traveled streets. Strangers make no effort to go around this obstruction in dark nights. The population of Petoskey is about 5,000.

It will be seen that Petoskey offers considerable attractions to summer visitors who may desire to make it headquarters for side excursions, and the erection of a large watering-place hotel on the brow of the cliff is talked of. For local out-of-door amusements there are boating, sailing, bathing and fishing in the bay; walks and investigations along the beach; picnics in the groves; drives to Bear Lake, Round Lake and Crooked Lake—all of which contain bass and pickerel; and hourly excursions by steamer across the bay to Little Traverse village, an Indian reservation, where the red man luxuriates after his own red fashion.

The city of Petoskey honors the name of one of the higher-toned of these aboriginals who still lives and occupies a large two-story frame house near the mouth of Bear River on the outskirts of the town. Some of Petoskey's daughters have married white folks, one of whom keeps an Indian nicknack and variety store of the pretentious height of three stories. The few Indians of Petoskey town are quite civilized; males and females both dress as neatly as most residents of the place, and in the same fashion. Old Petoskey is the most well-to-do hair-lifter that I ever came across in my extended wanderings. I am not sure but that he has other daughters yet in market.

The trip across the bay to Little Traverse Village is novel and most enjoyable. To a stranger, who watches the gulls dipping into its mirror-like surface in July and August, it seems incredible that a sheet of water so land-locked can ever be lashed into the tempestuous sea it sometimes is; yet it affords absolutely no shelter to vessels. They can lie at the pier only in calm weather; and even in mid-summer a casual storm or squall does much mischief to shipping. The so-called harbor is open and directly exposed to the most gale-bearing winds that blow; but vessels can generally take timely warning and run over to Little Traverse harbor, which is the completest shelter I ever saw. It is protected by lofty hills to the north and east. On the west a spit makes out from the mainland in a semi-circular curve, and incloses the little sheet of water lovingly and securely in its embrace. The entrance is on the south, and no one approaching it from any other point of the compass would ever surmise that a harbor was there. It is, however, deep enough and large enough to shelter an armada.

The houses of Little Traverse are chiefly the unpainted, one-story log or board cabins of the Indians of the reservation. The curiosities of the place are a dirty little mission church, with an altar of tawdry tinsel, and the inevitable old woman, whose age is anywhere from 60 to 130 years. As a local curiosity, to while away the half hour allowed ashore, she may be worth a minute's attention; but the sensible visitor would prefer to watch the boiling springs on the pebbly beach than to listen to the babbings of her garrulity. These springs are three in number, all very cold; the largest discharges a volume of water sufficient for a mill power. How these half-civilized red-skins earn a living is mysterious. A protracted induction into the arts of husbandry has not yet made them tillers of the soil. Their houses are kept in fair order, however, and there is less filth apparent around them than in many suburban purlieus.

After a hasty climb to the bluff behind the town and a stroll along the beach, we return to Petoskey, and having decided to visit the island of Mackinaw, book for a passage on the little, rough-weather steamer, Van Raalte. She is a quaint but staunch craft, having a cosy enough cabin and seven or eight state-rooms. Her certificate shows that her captain, Allan Dodge, is qualified by a twenty-years' experience as captain, pilot and engineer on four of the great lakes. This is sufficient assurance of capability, and we therefore confidently commit ourselves to his care, and grope our way out of the

bay under the dim starlight of a somewhat boisterous August night. At three o'clock in the morning, after a sail of five hours, we are summarily bounced out of bed, and, having dressed with some celerity, are hustled out upon a wharf, which we are told is at our destination. Two comfortable hacks convey a party of us to "Old Mission" Hotel, and we again betake ourselves to another interval of sleep without having more than a conception of the place where we are. Meanwhile the steamboat continues on to complete her trip to Cheboygan, leaving us a "lay-over" of two days, at the end of which time she will be around again and takes us up.

I am assured that no one who has ever visited the Island of Mackinaw will ever regret it. I found its natural local attractions more romantic and pleasurable than those of most places I have visited. It is about nine miles in circumference, and there are fine carriage drives across it with lateral roads to points of interest on its sea-girt boundary. I wandered on foot wherever I listed. I visited the site of the ancient fort which the British drove the Americans out of and occupied in 1812. It was a terrific struggle for possession and defense, during which a battery of a single gun was brought into play on each side, with havoc that the historian has never dared transmit to an anxious posterity. Some ruins of the old stockade and earth works remain. Just here is a farm and buildings which occupy the centre of the island. It is the only farm on it. All the rest of the island, not including the town site, has been set aside as a national park. Its natural points of interest have been designated as follows: British Landing, Friendship's Altar, Scott's Cape, Sugar Loaf, Arch Rock, Fort Holmes, Maiden's Rock, Fairy Arch of the Giant's Stairway, Leaning Rock, Point Lookout, Robinson's Folly, Devil's Kitchen, Lover's Leap, Skull Cave and Chimney Rock. As may be inferred from the names these objects are precipitous cliffs, caves, arched rocks or conical peaks. The most impressive are: Point Lookout, a sheer precipice southeast side of the island, from which a far-reaching view can be obtained. It is an angle of the cliffs, and its summit is about 200 feet above the level of the lake. The Arch Rock is an abutment and arch thrown out from the main body, or rather cut off from the main cliff, at nearly a right angle with it. Its summit is 150 feet above the lake, the spring of the arch is 110 feet and the span about ninety feet. The arch is three feet wide, and visitors often cross, though the feat is trying to the nerves. The Sugar Loaf is an isolated limestone rock, of a conical shape, some eighty feet high, standing near the centre of the island. To climb to the apex is considered a feat of some difficulty, but I have seen it done by two ladies. There is a cave in its side about one-third of its height from the base, large enough to accommodate half a dozen persons. In the Cave of Skulls a party of Sioux once took refuge from their enemies, the Ottawas, more than a hundred years ago; but the Ottawas kept fires burning at the entrance until all the inmates were suffocated.

Most correspondents entertain their readers with a history of the early French occupation, and the subsequent triangular struggle for possession by the English, French and Indians, with some synopsis of what the books contain respecting the fur company's occupation, of which substantial evidences still remain; but I prefer to speak of things present, so that the reader may gather a better idea than I had before my visit of what may be seen there now. Certainly, a sail into the Strait of Mackinaw on a calm day is one of the most romantic, not only by reason of its surroundings, but of its historical associations to which we have referred. From the offing one sees the town stretched along a semi-circular shore under a bluff, very much as Little Traverse Village lies. Three parallel streets occupy the level longitudinally, while the ramparts of Fort Mackinaw crown the cliffs behind. The fortifications are whitewashed, and, being embedded in foliage, are most picturesque. Although several of the buildings are old, like the John Jacob Astor House and the Old Mission they have been modernized, and the aspect of the picture is anything but antique. Several pretty summer residences, with gardens and fountains, adorn the street that follows the line of the beach, and lend a home-like aspect. Numerous two-masted Mackinaw boats and other craft at anchor off shore, or alongside the little piers that reach out from land, give animation to the pretty scene. Several islands are within sight, and the extreme point of the peninsula of Michigan lies opposite. Over there is located Mackinaw City (on paper), and the prospective terminus of the Grand Rapids and Indiana Railroad, when it shall be extended. The principal hotels are the Old Mission, which I prefer; the Island House, a sort of hotel-boarding-house with a pretty lawn and flower garden; the John Jacob Astor House, in the centre of the village, with its entrance flush with the narrow street; and the Lake View House, at the western extremity of the town. All are comfortable and well kept, at from \$3 to \$3 per day. Altogether the island is one of the most unique and delightful places in the world. Twenty-five years ago, Charles Lanman, the author-tourist, who now enjoys a hale old age, described Mackinaw as he saw it, approaching it from the North.

"First was a perpendicular bluff crowned with a diadem of foliage, at the foot of which was an extensive beach occupied by an Indian encampment, where the rude barbarians were sunning themselves like turtles, playing fantastic games, repairing their canoes, making mats, or cooking their evening meal as fancy or necessity impelled. One sudden turn and our vessel was gliding gently into a crescent bay which was skirted with a cluster of trading houses and ancient looking dwellings, above which, on a bluff, was a snow white fort, with soldiers marching to and fro upon the battlements. \* \* \* From time immemorial the Indians have been annually sum-

moned to this island for the purpose of receiving their regular installments from the government in the shape of merchandise and money, and on these occasions it is not uncommon to see an assembly of three thousand fantastically dressed savages. \* \* \* Like so many of the beautiful places on our Western frontier, Mackinaw is now in a transition state. Heretofore it has been the Indian's congregating place, but its aboriginal glory is rapidly departing, and it will soon be the fashionable resort of summer travelers."

These predictions have been verified. The peculiar location, picturesque cliff scenery of Mackinaw, and the tonic character of its climate, render it one of the most attractive watering-places in the country. It can be reached by steamer from Chicago and Detroit, and there is also a line running to Sault Ste Marie, which connects there with Canadian steamers and points on both the north and south shores of Lake Superior. Of course the place is entirely ice-bound in winter, and all the hotels and cottages are deserted. The monotony is only broken by the arrival of a monthly mail, or the sound of reveille on the ramparts of the fort.

As I contemplated the beautiful island in the haze and mirage of an August morning, as our little steam yacht spluttered away from it toward Bois Blanc and Cheboygan, it was an enchanted creation of dreamland, whose white cliffs were ethereal structures, reflecting the light of a glory whose source was brighter than the sun. Little by little it disappeared in the distance until it became a line of light on the horizon. Bois Blanc Isl and was abreast of us in the near foreground, and the rattle of lumber on the deck of a schooner becalmed dispelled the illusion and reverie alike. Then a long line of painted casks marking a channel filed past us, and presently a steam tug puffled by noisily, going lakeward; then turning toward the land, we saw tall smoke-stacks of saw-mills reeking forth black volumes of smoke, and the clustering houses of a large town. Right before us were wharves with shipping and steam-tugs, and a wide strip of dark-colored water led directly thereto, marking the channel where the Cheboygan River empties its waters into the clearer and transparent waters of the lake. This was our starting-point for the first chain of interior lakes which we proposed to visit. How we proceeded and what we accomplished I will relate in my next letter.

HALLOCK.

AMERICAN INSTITUTE EXHIBITION.—The fine halls of the American Institute Exhibition are crowded day and night, and the opinion is that a better or more complete show of the industry of the country never before was brought together in the metropolis. In rods, tackle, hooks, reels, flies and the whole paraphernalia of the fisherman's outfit, the display made by Messrs. Conroy, Bissett & Malleon, is wonderfully complete. In several handsome cases may be seen rods of the most exquisite make and finish, either those so light and supple yet so strong, suited to trout fishing, or those of more massive build, adapted to the heavy bass which make the spray fly off Newport. An hour can be spent profitably in examining the endless variety of lines, hooks, flies and reels. The excellent reputation of Messrs. Conroy, Bissett & Malleon is fully sustained by the display made by them. It is a wonder that there are not other exhibitors. The Bohemian Glass Works, who have their wares smashed to pieces all over the country every day, who manufacture the glass balls now used in trap-shooting, make also a fine show. The rough glass balls which serve for the same purpose, to which Capt. Bogardus has given his name, are also on exhibition, made by Messrs. Hungry Bros. & Co. From the quantity of these glass balls which are being shattered, their use extending every day, we might almost fancy that the price of glass for window panes and tumblers would be on the rise. That beautiful invention the sand blast, which allows of the ornamentation of glass, at very cheap rates, has some very fine exhibits at the fair. Though a mechanical process in some respects, nothing can exceed the elegance and grace of the designs, and the admirable character of the work. The various specimens exhibited by Messrs. Hayes & Phillips, of 153 and 155 Centre street, attract particular attention.

MAJOR LEECH.—We call attention to a very kind letter, addressed to us by our very much esteemed friend Major Arthur B. Leech. The gallant Captain of the Irish team has a scheme, which we now present to the notice of American riflemen. This suggestion of Major Leech's is not entirely novel; it is not to be regarded as a challenge. With the most pleasant remembrances of Major Leech, in which we are sure all the readers of the FOREST AND STREAM AND ROD AND GUN unite, we trust to hear frequently from this gentleman, who has done so much to advance rifle shooting in the United States.

—Oscar Jasigi, Esq., who has served for considerable time as the Turkish consul at Boston, has just been promoted by the Government of the Sublime Porte to be Consul-General. His brother sportsmen will tender their congratulations. His Excellency will spend several weeks next winter at Charlotte Harbor, on the Gulf coast of Florida. We may mention, as an evidence of this gentleman's enthusiasm, that he has twice crossed Newfoundland in the interest of sport.

ART LECTURES.—Rev. J. Leonard Corning, who has devoted several years in Europe to the study of the History of Art, has been invited by a number of our most eminent citizens to give a course of lectures on the subject. The eight lectures are to be given in the hall of the Y. M. C. A., beginning November 19.

quently than was the custom for idlers to do heretofore. We must watch your progress and try to keep pace with you.

Your friends here will remember the courtesy of the FOREST AND STREAM, whose editor catered so liberally for their sport "out West" in 1874.

I have a scheme in my mind, which I may shortly bring to your notice, for the information of your champion team, but I will reserve it for another occasion.

Believe me, dear sir, your faithful and obliged ARTUR B. LEECH.  
DUBLIN, 49 Rutland Square, Oct. 19, 1877.

### MAJOR LEECH'S SCHEME.

49 RUTLAND SQUARE, DUBLIN.  
October 20, 1877.

MR. DEAR SIR—It is needless for me to repeat here my admiration of the great skill and endurance which brought to a successful termination, for America, the great match with the British Team for the Centennial Trophy, as I have written at length on the subject to the FOREST AND STREAM, and toward the close of that letter I alluded to a matter, which I did not further particularize, that I would shortly have the pleasure of bringing to your notice; and as there is no reason why I should longer pause to open the subject for the consideration of your association, I shall now proceed to do so.

By the rules of the Centennial Match, the winning team may select the range for the future competition of that trophy, the winners of which are the champion rifle shots of the world so long as they can hold the prize.

The American success at Creedmoor has been so uniform hitherto as to cause it to be asserted that the range gives undue advantage to the American Team, and that perhaps a change of venue might not be unacceptable to your champions. It has occurred to me that some neutral ground, which I before ventured to suggest, might be agreed upon for the next competition.

Again, the Irish and American match is one that, I have reason to believe, is the wish of the Americans, as it certainly is of the Irish, to perpetuate, and thus to still further induce, as far as rifle shooting intercourse can, that kindly reciprocity of feeling so happily existing; and it is very gratifying to feel that our united efforts to create good will are fully acknowledged on both sides of the Atlantic.

The great World's Exhibition to take place at Paris in 1878, would seem to offer all the advantages of a neutral ground for one or both of these competitions.

If my proposal is favorably received, and if your team decide on coming to Europe next year, I need not say what pleasure it would give us to welcome our American friends once more; and if Paris be selected for the Centennial Match, I have no doubt that an Irish team would be certain to enter for it. That the French authorities would give us facilities for such a trial of skill I have reason to believe, and the terms being already settled, we have but to adhere to the rules of the Centennial Match.

With kind regards to all my friends, believe me to remain, Yours very faithfully,  
ARTHUR B. LEECH.  
COL. SOHMERHOHN, Sec. N. R. A. of America, N. Y.

MAJOR LEECH.—We take the following from the *Whitehall Review*:

Probably no man in Dublin stands more in that fierce light which beats upon a popular personage than the Major. Not to know him would argue one's self unknown. This is the organizer of victory, the Carnot of the Rifle Match. It is not so much that he himself has shot as that he has been the cause of shooting in others. He is the forester of the *franc-tireurs* of Erin. Long before the Lords and Commons met at Wimbald's Dun, and while yet the Elcho Shield was a chimera, careering through space, the Major set himself like the Prussian strategists, to train in secret a force which should in time go forth to conquer and surprise. He had but narrow means to work with, for the Irishmen legalized to have and use firearms are few, even among the better classes, and so they are likely to remain while the populace makes so capital a shift with the shillelagh or the section of limestone which serves as the *ultima ratio* in the political or religious differences of the isle. Cribbed and confined as he was, the Major wrought wonders. His measures complete, he forthwith declared amicable war against the two Britons, and at the head of eight sharpshooters invaded England. He was defeated in a pitched battle at Putney Heath, and this was but the first of a series of disasters. But he never lost heart; like another Arthur, sans his Excalibur and his Tennyson, he "cleared his Table Round with large, divine and comfortable words," and so screwed their courage to the firing point that they again and again encountered Scot and Saxon till they marked at length the tallest score, and carried the trophy home to Erin. The Major made his triumphal entry that day like a Coriolanus, and then set about the subjugation of the other hemisphere. But he was less successful in a land where one-third of the inhabitants are Majors; at all events he won no spoil from the Yankee. But he wrote a book, with an epigraph, intimating that his ambition as a promoter of rifle shooting "reached the sky," and in other respects betraying a harmless vanity. However, a hiring on a Dublin newspaper was unmuzzled and set to bay the Major. He might as well have bayed the moon, for he never ruffled a feather of the serene complacency which marks every lineament of the genial, high-spirited and deservedly popular gentleman, whose heart is so much in his hobby that when that translation which he hinted at in his volume takes place, it will not be his fault if he does not get up a *tir en cavalcade* between the shooting stars, with for team captains, say *Ursa Major* and himself.

—The *Volunteer Service Gazette* is particularly interesting, as it contains quite a series of letters from Major Leech, Mr. Stamford, S. Young and Mr. John Rigby, in regard to the American Centennial contest. Mr. Rigby's letter is very manly, and to the point. He complains that the English National Rifle Association have not paid sufficient attention to new arms, "and that in endeavoring to reduce all rifle shooting to a dead level of equality, they were really banishing from the association its best friends, and gradually depriving its meetings of all attraction for men of scientific or inventive minds." In regard to his own make of rifle, Mr. Rigby writes as follows:

Four of the British used the Rigby rifle. They loaded, as usual in this climate, without wiping between the shots, and

with ordinary lubrication. They averaged 199½ per man per day, and their best man 204 1-3, or slightly over the best of the Americans. The remaining four Britons used the Metford rifle, and, I am informed, adopted a system of cleaning out between the shots. They averaged 191½, and their best man's figure was 194. When we examine the scores of the match itself, conclusions drawn from the practice days are modified. The first day was fine, but hot. American average, 206½; four British with Rigby rifle, 206½; four British with Metford rifle, 200½. The highest individual score (114) would have been credited to Mr. Milner, but that he placed his second bullet's eye at 1,000 yards on the wrong target. Sir Henry Halford spoiled a fine score by firing one shot without a bullet.

Mr. Rigby then goes on to say, "That on the final day, though it was calmer, it was ten degrees hotter, and then that the Metford squad improved slightly, making an average of 203½, while the Rigby squad fell off to 201." Mr. Rigby concludes as follows:

We learn from this year's experience that unless the rifle-men of Great Britain resolve to give more attention to long-range shooting they must content themselves with a second rate position, and acknowledge the supremacy of America, and this is by no means so unimportant a matter as many suppose. The success achieved at Creedmoor has been mainly due to the National Rifle Association of America, ably seconded by the exertions of manufacturers of military arms, who desire to make use of the reputation so gained in competing with English manufacturers for the supply of arms to foreign governments.

Mr. Young's communication is rather directed to the excellence of our American team shooting, which, as an art, the gentleman states has not been cultivated in England. Mr. Young makes an important point on "new blood," and how we have been working here to get the best and freshest men to the front:

We thought the Yankee team that came to Wimbledon in 1875 most excellent, but in their team of 1877 only one member of the 1875 team was good enough for a place. This new blood, which we so much want, had displaced the *quondam* heroes.

Major Leech's letter is an excellent one, and we regret that want of space prevents our publishing it in full. In speaking of the *Spirit of the Times* match, the Major writes:

In this match all the members of the successful American team took part, as did the British team; there was no *coach-ing* allowed, and the gross score of our team was superior to the American team in that competition; therefore it is somewhat premature to assume that our Rigby and Metford muzzle-loaders are not still equal to the American breech-loaders in all circumstances of temperature and weather, although possibly at a disadvantage on the particular occasion of a calm day, with the thermometer at 100 degrees in the shade. [The italics are our own.]

In writing about team shooting, Major Leech says:

A team to proceed to America should, if possible, practice together as a team for a considerable time previously, and for this reason alone I am, as I have always been, an advocate for separate teams proceeding for Ireland, England and Scotland, each representing its own country; but when successful, proud of being so on behalf of the United Kingdom.

We have but few comments to make on these letters, most important contributions as they are to the history of rifle shooting. What we honestly believe is that, granting the superiority of our team shooting, American breech-loading rifles are better than English muzzle-loaders. If ever the English, Irish or Scotch teams, individually or collectively, are to beat us, it will be when they introduce breech-loading guns as good or better than ours. There is no difference between the rifle-men of the United Kingdom and our own as to skill.

What shall we call it? Is it pig-headedness? No, let us say rather that conservatism, which makes Englishmen adhere to something or other, which their common sense should have made them abandon long ago. It may be thought stupid on our part "to show where the whip is with which we may be scourged," but we only repeat what is apparent to every rifleman in the United States—"That it is a question of guns and not of men."

—The *Dublin Irish Times*, in an editorial commenting on the late International rifle match at Creedmoor, says: "The men, with one exception, who most distinguished themselves, were Irishmen. Yet it is precisely these men who are debared from taking part in the most important matches at Wimbledon. Worse still, the National Rifle Association (British) seem to have made up their minds to utterly ignore both Ireland and Scotland; and even Sir Henry Halford—in the course of a speech made at Delmonico's, New York, in reply to the toast of 'The British Rifle Team,' which he so ably captained—expressed a strong desire that when next a rifle team from this country went across to America to compete with our Yankee cousins, the Board of Directors of the National Rifle Association of America could arrange so as to make that team the representative team of Great Britain, and not accept additional teams from Scotland and Ireland. Anything more preposterous was surely never heard of. When the so-called International team visits America the respective nationalities are conspicuously paraded, in order to show the closeness and harmony of union between the three countries. When, however, the competitions take place in this country, and at Wimbledon, Irish rifle-men are totally debared from competing for the most important prizes. Anomalies like these should not be allowed to exist; the subject of the rules of the so-called National Rifle Association (British) has engaged the attention of the Council of the Irish Rifle Association, who, we expect, will regard the interests of Irish rifle-men."

—The *Volunteer Service Gazette*, which always writes moderately and sensibly in regard to rifle matters, has the following on the International contest:

We do not intend now to reopen the arguments by which it was, eighteen months ago, sought to prove, on the one side, that this country ought to be represented by three different teams, and on the other that we ought to try to get the best single team we could from the United Kingdom, without caring what proportion of its members came from England, and what from Ireland or Scotland. Neither is it worth

while to consider the ingenious argument brought forward by some of our American friends, that inasmuch as the great Snider match at Wimbledon between English, Irish and Scotch, used to be called by ourselves an "International" match, that, therefore, in an International match in which a foreign country takes part, we ought still to preserve our "nationalities" without regard to the "political" unity of which those nationalities form part. Our only object at present is to urge upon all concerned the great desirability that the directors of the United States National Rifle Association should take the matter seriously in hand, and lay down, once for all, the principle on which foreign teams are admissible to shoot for the great Centennial Trophy in future years. We do not for a moment deny that the question is not a very easy one, or that it seems to be complicated by the assertion which is vigorously made, that the directors are bound to admit separate teams from what we have called "sub-nationalities," because they have once admitted them. We are sure that the decision will be carefully considered, and that it will be accepted without demur, even if it should result in the substitution, as far as we are concerned over here, of two or three independent teams for one really national team. Whatever may be said, a very large body among us, including English, Irish and Scotch, dislike intensely the idea of contending against foreign competitors and against their own countrymen at the same time. An Englishman views with very different feelings a contest with the Irish or the Scotch—among ourselves, as it were—and one in which a foreign opponent is also concerned. We are convinced that this view is strongly held, and that, rightly or wrongly, it will always militate against the formation at least of an "English" team for the Centennial Match. The case is different as regards our Colonies. Theoretically, we should like to see Canada, Australia, etc., ranged upon our side in an International rifle match, but it is clearly practically impossible for any captain to get together a team which shall include, besides our own islands, s, Canadians and Australians, and we must be content at the best to ask that the United Kingdom should be represented, as a whole, and not in three parts. At any rate, we hope that the question will speedily be settled, and that both the Americans and ourselves may be in future spared the difficulties which arose in 1876.

RIFLE TWIST.—*Editor Forest and Stream*: I write to see if we young rifle-men cannot gain some information about the twist of a hunting rifle? Cannot we have a discussion on that subject from rifle makers? I am tired enough of the recoil theory [Amen]. Is it not enough to know that the gun is bound to "kick," any way you fix it? Please "give us a rest" on that, and have something new. The rifle makers, as far as I can find out, use a sharp twist, from an 18 to 30-inch twist (I am speaking of breech-loaders now).

Would also like the best twist for a 40-cal 70 grs. Will the straight shell give less recoil and somewhat velocity (or more) than the bottle-neck. Am partial to a 40x70 and explosive bullet for large game, (deer I mean—we have no larger here). Those posted say the Frank Wesson twist is one turn in 18 inches; Remington, 1 in 20 and 22; Sharps 1 in 20; Ballard, 1 in 20 and 24; Maynard, 1 in 30. And now will the rifle makers tell us what the best twist for a hunting rifle really is?

HUNTING RIFLE.

A RIFLE GALLERY IN A CHURCH.—The "Church of Christian Endeavor," in Brooklyn, has, among other modern improvements, a shooting gallery where the brethren endeavor to hit the bull's-eye. The *Baptist Weekly* hopes the pastor can say: "The weapons of our warfare are not carnal," even if he does practice with pop-guns.

CHANGING MUZZLE-LOADERS TO BREECH-LOADERS.—I believe the principal objection to breech-loading shot guns converted from muzzle-loaders is that, in enlarging the chambers to admit the cartridge, boring out the barrels cuts away so much metal as to greatly reduce their strength and render them unsafe for even moderate charges. For the interest of fellow sportsmen who would like to have muzzle-loaders changed to safe breech-loaders, I wish to suggest to the gun-makers a plan which I am not aware has been before proposed and which I think would obviate the above named objection to the converted guns. It is to enlarge the breeches to the right size for shells by heating the barrels at the breeches and expanding them on a mandrel. This would leave them as strong as new, less the trifling decrease consequent on heating; and I am not sure there would be any diminution of strength if the work was done by a skillful mechanic. I think that by "hammer hardening" the barrels, where heated, their original tenacity would be restored. The expansion would produce a slight external enlargement, detracting a little from the symmetry of the barrels, but this is no serious objection to the plan. I am not a gun maker, and perhaps overlook faults in the plan that will be obvious to professionals. If any of your readers should give me a trial I hope he will communicate the result of his experiment through your columns.

Rochester, Oct., 1877.

### WINCHESTER RIFLE—MODEL OF 1876

ABOUT THE ABSENCE OF THE SLIDE.

HELENA, M. T., Oct. 16, 1877.

WINCHESTER ARMS CO.:

Some time ago I wrote you in regard to more powder in your guns. Was pleased when I saw the model of '76; bought one; tried her, and christened her "Old Mortality No. 2." They are "world beaters!" and no mistake. In viewing them with a critic's eye and comparing them with the model of 1875, the question suggested itself—"Why was the slide over the opening omitted?" The slide was considered by gun fanciers a great improvement and a very necessary one. Again, why was it omitted? There must be some reason. Won't you answer through FOREST AND STREAM?

NEW HAVEN, CONN., Oct. 31, 1877.

EDITOR FOREST AND STREAM:

Gentlemen.—We inclose a letter received to-day, which we answer as requested through your columns. The slide placed upon the Winchester guns, model 1875, was left off in the model of 1876, as a matter of safety and precaution. Of the great number of people using our Arms Model, 1875, many are ignorant of the proper use of them, and always close the slide over the carrier-block morrise; and if they find a cartridge with an imperfect head, and it blows the head off, the gas escapes into the breech and lock-work, thereby causing damage that would not occur if the cover was open. There are many of these cartridges in the market for all our guns, made expressly for the purpose of injuring our reputation. Consequently, we have to caution our customers against any cartridges not of our make, as we will not be responsible for any damage to the gun by any cartridge but of our own make. Respectfully yours,

WINCHESTER REPEATING ARMS CO. (Swecacy).

## BOATS AND YACHT BUILDING.

By NAUTICUS.

DRAWING, MODEL-MAKING, ETC.

There are other ways of "fairing" the lines and proving the correctness of our drawing, but, if four or more buttock lines are used, we may consider our work "fair," and dispense with any further proof. In our drawing we have made the rabbet of keel the base for the body and sheer plans; but where there is much difference in the draught of water forward and aft, it is customary to make the load water line the base. The water lines in our drawing are parallel with the load line and with one another; if there is much "drag" or difference in the draught of water forward and aft, the intermediate water lines are drawn at equal distances between the load water line and the rabbet of keel. As these papers are designedly elementary, we will confine our remarks to the method explained in the previous papers. Those who wish to pursue the fascinating study of designing are referred to the elaborate work of J. S. Russell—The Modern System of Naval Architecture, price forty dollars; Rankine's Ship-building, price forty dollars; Fincham's Outline of Ship-building, price fifteen dollars; Marrett's Yachts and Yacht-building, price five dollars; Bretts' Notes on Yachts, price three dollars. Also Kemp's new work on Yacht designing, price twenty-three dollars.

The last mentioned work I have not seen, but from the reputation of the author, have no hesitation in recommending it. After the drawing is completed, the designer may wish to make a model, and, as model making is a source of considerable amusement and pleasure, I will explain the method of making one from the drawing. Models are usually made to represent one-half of the proposed vessel, and may be made of pine or of alternate pieces of pine and mahogany.

Cut pieces of board the length of the sheer plan, and as thick as the distance from one water line to another, a piece is provided for each water line or other longitudinal division of the sheer plan. The widths to cut the pieces of boards are found from the half breadth plan—the width of each water line at midships, giving the width to cut the pieces of board. Each piece of board has a water line of the half breadth plan marked on it. Cut the several pieces to the outlines marked on them, pile them up on one another in their proper positions, work down the ridges with spoke-shave, gouges and rasp, and finish with sandpaper. If a fine finish is wanted, rub down with oil and pumice stone, varnish and polish. If the displacement of the model is required, the pieces of boards from the proposed load line down should be of the same width and length before cutting, thus forming, when piled together, a block. Weigh the block before cutting, and measure its length, width and depth—from which data the cubical contents can be calculated. After the model is finished, reweigh the part from the load water line down, and the difference between the two weightings gives

the data to compute the displacement to the load water line. If the wood used is of uniform density, and the calculations made with care, the results are quite accurate. The following example which I have worked out will explain the method: Block to proposed load line measured, before cutting, 21.625 inches long, 2.9375 inches wide and 1.6875 inches deep. It weighed twenty-four ounces; cutting reduced its weight to seven ounces, or seven-twenty-fourths of its previous weight. The dimensions of the block, as given above, multiplied by twenty-four to give the dimensions the full size of the proposed boat, would be 43.25 feet long, 5.875 feet wide, and 3.375 feet deep; this reduced to cubic feet equals 875.5 cubic feet; as cutting reduced the weight to seven-twenty-fourths of the whole block, we take seven-twenty-fourths of 875.5 cubic feet, which leaves two hundred and fifty cubic feet as the displacement of one-half the proposed boat. Multiplying by two for displacement of whole boat, we have five hundred cubic feet total displacement. Water weighs 62.5 pounds to the cubic foot; reducing our figures to tons, we have 15.6 tons displacement. The displacement—calculated by Chapman's rules, which are probably the most accurate known—is 14.9 tons. The above method is simple, easily done and sufficiently accurate for small vessels. The position of the "centre of gravity of the displacement" longitudinally, can be found by balancing all that part of the model below the load water line, on a pencil or similar object. Thus far we have considered "half models" such as builders use; to make whole models for model yachts, the pieces of wood used are twice the width of the half breadth plan, and have the water lines drawn on both sides of a central longitudinal line. After the outside of the model is finished, the pieces are taken apart and the interior is cut out, leaving the sides any thickness the builder may fancy. Afterward put on a stem, stern post, keel and deck, gluing all together; polish and varnish. The "centre of effort" of the sails should be at the "point velique," which is found as follows: Step an upright mast at the centre of gravity of displacement, ballast the little vessel until the load line comes down to the level of the water, tie a cord to the mast, and pull the model smartly through the water without jerking; if the bow is depressed in the water, slip the cord lower down on the mast; if the stern is depressed in the water, slip the cord higher up on the mast. Experiment until a point on the mast is found from which the model can be pulled smartly through the water without depressing either bow or stern. This point is the "point velique." If the mast is at the "centre of lateral resistance," the model can also be pulled sideways through the water without any tendency to turn around; if when pulled sideways either end of the boat turns around toward the experimenter—either more keel must be added to that end, or some cut off the other, until the resistance is equal on each side of the point from which the cord pulls. The centre of lateral resistance can be found by cutting a piece of sheet lead into the exact size and shape of the outline of the model below the load water line, and balancing it on a pencil. The balancing point is that on which the vessel turns when acted on by the sails and rudder; for convenience, we call this point the "centre of lateral resistance." Properly speaking, it is the "centre of the vertical longitudinal section immersed." The mode given for finding the centre in question is simple and sufficiently accurate for our purpose. The centre of effort of the sails is the point where, if an imaginary line were drawn either horizontally or perpendicularly through it, the pressure of the wind on one side of the line would balance the pressure on the

other. If the centre of effort of the sails is in the same vertical plane with the centre of lateral resistance of the hull—the vessel in sailing to windward will keep her course without any tendency to turn either way. A vessel is said to have a "lee" or "weather" helm as the position of the centre of effort is before or abaft the centre of lateral resistance. A small amount of weather helm is desirable, therefore arrange the sails so that the centre of effort will be a little abaft the centre of lateral resistance; there is no exact rule for the proper amount. Marrett gives it as .006 to .01 of the length of the load water line for schooners, and for cutters .02 to .05. The area of a triangular sail is found as follows: The triangle A B C, Diagram number twenty-one, represents the jib of a sloop; draw a line perpendicular to the side A C to the point B, multiplying the distance from D to B by the distance from A to C, and divide the amount by two; this gives the required area. The centre of gravity is found by bisecting the side A C, draw a line from B to the bisected point at E, then two-thirds of the distance B E, set off from B toward E will be the centre of gravity of the triangle A B C. The area of the main sail of a vessel is found by dividing the trapezium A B C D—diagram number twenty-two, into two triangles, by a diagonal line from A to C, or from B to D; find the area of each triangle separately and add them together. The centre of gravity of the trapezium A B C D is found by first finding the centre of gravity of each of the four triangles A B C, A C D, A B D and B C D, the four centres are marked on the diagram at E F G H. Join the opposite centres by lines drawn from one to another as shown on the diagram, and the intersection of the lines is the centre of gravity of the trapezium A B C D. If a vessel carries but one sail, the centre of effort is at once known, as it will be at the centre of gravity of the sail. If two or more sails are used, the height of the centre of effort of the combined sails is found by the following rule: multiply the area of each sail by the perpendicular distance of its centre of gravity from the water line, then dividing the sum of these products or "moments" by the sum of the areas, the quotient is the required distance. As an example, diagram number twenty-three is worked out thus:

|               | Areas.  | Height of C. G. |          |
|---------------|---------|-----------------|----------|
|               | Sq. ft. | above L. W. L.  | Moments. |
| Jib.....      | 123     | 8 feet.         | 984      |
| Mainsail..... | 284     | 11 "            | 3124     |
|               | 407     |                 | 4108     |

4108 divided by 407 equals 10.09 feet—the height of the centre of effort above the load water line. The position of the centre of effort of the sails, relative to a perpendicular from the water line at the centre of lateral resistance, is found by dividing the difference of the moment of sail before and abaft the perpendicular by the sum of the areas of sails. The moments of sails before perpendicular are marked *minus*; moments of sails abaft the perpendicular, plus; the centre of effort will be before or abaft the perpendicular, according to the preponderance of plus or minus moments. Example:

|                      | Areas.         | Dist. of the C. G. from perpend'r at the C of L. R. | Moments. |
|----------------------|----------------|---|----------|
|                      | Sq. ft.        |   |          |
| Staysail or jib. 123 | 8.5 feet minus | 1045  |          |
| Mainsail..... 284    | 5.26 "         | plus 1491   |          |
|                      | 407            |   |          |

then (1045—1491) divided by 407 equals 1.09 feet—the distance the centre of effort is abaft the perpendicular at the centre of lateral resistance. It is requisite that the designer give the greatest care and attention to the adjustment of the various centres to one another, to insure a well-balanced and safe vessel. It is true, the vessel can be so ballasted as to bring the centre of lateral resistance farther forward or aft, but in such a case the skill expended in modeling the vessel is lost, as the water line will not be the one desired. The mast may be moved farther forward or aft; or one of the sails may be reduced in size and another enlarged, but all such alterations are costly, and after being done are only a "botch."

—New Orleans has a new rowing organization, the Mississippi Rowing Club.

NEW YORK, Nov. 2, 1877.

EDITOR FOREST AND STREAM: We want a good little sloop-yacht, about 25x10 feet and with some depth, say about 3½ feet, at least, and flat bottomed, so that we can go outside in them. We don't want any more of these skimming dishes, with lots of ballast in the maud five or six men to manage them, but staunch little boats with a cabin, so that if we get caught in the rain away from home we can "bunk" and not get drenched. Such a boat I intend having built as soon as I can get a model to suit me. I want to make a cruise next summer up the Hudson and Lake Champlain. I wish to have a boat I can handle myself and not get upset every time it breezes. Can't you give me a model in your paper of such a boat in the course of your papers? Yours, etc., LITONIA.

[We intend to devote a certain amount of space to this exact build of boat.—Ed.]

YACHTING IN BLUE WATERS.—Yachting is undeniably looked upon by the mass of the community in the light not only of a slothful and luxurious pastime, but as an actual waste of time; yet it is none the less true that the larger number of those who cruise upon blue water are men of positive character, who, becoming impatient of the humdrum conventionalities of society, prefer to assert their manhood in contention with the elements. And these men, who may have previously been skirmishers on the outposts of science, are not infrequently, by the very nature of their new pursuit, drawn within its charmed circle, and by their observations and experiments become important contributors to it.

The enthusiastic yachtsman can not sail his vessel for ever so short a time without discovering certain peculiarities in her build which he flatters himself he could improve upon, and his active mind at once institutes intelligent inquiries into the laws of force and resistance, examining critically the various theories, principles and formulas held to by the shipbuilder, informing himself as to the varieties of ship timbers, their tenacity, density, etc., until he almost unconsciously finds himself drawn within the labyrinth of marine architectural disputation, and what at first was a diversion, soon becomes an absorbing passion. Having ample leisure and means usually at his command, he dives *con amore* into the most difficult paths of applied mechanics, creates, destroys and recreates, until he finally effects radical and startling improvements in the art. Indeed, it is to this restless spirit that we owe the success of the yacht America, which, after thirty years of vicissitude uncommon to even the sea-going vessel, is probably to-day as staunch and fast as any vessel afloat, for her owner, Mr. Stevens, built three large yachts, the Wave, the Onkaybe and the Maria, before he was satisfied that he had discovered the lines which would insure speed and seaworthiness.

No yachtsman who has the energy and pluck to cruise on blue water would be willing to remain an hour longer than necessary a supernumerary aboard of his own yacht, or to give up control of her to his sailing-master. That would be all very well for the smooth-water yachtsman, who finds sufficient excitement in the click of a champagne cork or the admiration of his lady guests; but once on blue water, a man would feel like a prisoner in charge of a jailor if he were not in supreme command. Hence he feels that he must at once tackle what has always seemed to him the intricate science of navigation; but he soon discovers that, so far as its ordinary practice goes aboard ship, it has been reduced to a simply mechanical operation, by which men with the merest rudimentary education may with ease solve its problems. This only incites him. He is not satisfied to work "by rule of thumb." It is all very well for his sailing-master to take his sextant and measure an altitude of sun, moon, or star, or a lunar distance, and define his position by means of tables computed for him, but he must know why such angles and such distances give such results, and is thus led to investigate the foundation of the theorems, and familiarize himself with the movements of the heavenly bodies, and calling to his aid his half-forgotten mathematical training, finds himself engaged in an intensely interesting pursuit.

Meteorology, which is essentially a science kindred to that of navigation, ranks among its students the practical philosophers of our times, and they rely, to a very large extent, upon the notes entered on the "log-book" for data for the confirmation of their theories. The flight of a bird, the floating mass of sea weed, the barnacle-covered log, the

unusual drift of a current, the varying temperature of sea or air, the nebulous condition of the sky, are all incidents of seemingly little import, but which serve as important data for scientific deduction; hence the observant navigator becomes a co-laborer with them, for upon his familiarity with the laws governing atmospheric changes as affecting the movement and force of wind and the course of storms largely depends the safety of his vessel.—T. ROBINSON WARREN, in *Harper's Magazine* for November.

## National Pastimes.

**NEW YORK ATHLETIC CLUB.**—The final games of the season were contested on the club grounds at Mott Haven last Tuesday. There was an extraordinarily large list of entries, though the number of starters was not so great. In the first trial heats of the 100-yard race there were forty-three entries and the heats—eight in number—were run off promptly, the wind blowing down the track and favoring good time. The first heat was won by J. B. Elliott in 14.4-5s, R. D. Neeson second. Second heat, M. H. Burch, 10.3-5s; A. Douglas third. Third heat, J. Schuyler, 10.4-5s, with C. Schuyler second. Saportas took the fourth heat easily in 10.3-5s, W. A. Douglas second. The fifth heat brought out H. Parsons as winner in 10.3-5s, and Wm. R. Thornhill second. In the sixth heat J. O. Murray was first in 10.4-5s, with J. W. Arthur second. In the seventh heat O. B. McCorkindale came in first in 10.4-5s, with C. B. Knapp well up. The eighth was a walk-over for Emil Roth, 30 time being taken.

In the second trial heats were entered the first and second in the first trial heats, and the four heats were won as follows, the running being close and good in nearly every instance: The first was won by Burch, of the H. A. C., in 10.3-5s; the second by C. Schuyler in 10.2-5s; the third by H. Parsons, of the Nerous Boat Club, in 10.3-5s, and the fourth by C. W. McCorkindale in 10.3-5s. The final heat brought out the four winners of the second trial heats: Elliott, of Green Point, 5 yards allowance; Schuyler, of New York, 20 yards; Parsons, of the Nerous Boat Club, 25 yards, and McCorkindale, of New York, 25 yards. Parsons won by six inches, McCorkindale second, Elliott third and Schuyler fourth; time 10, 2-5s.

In the two miles walk there were twelve starters, the most noticeable among them being the name of a pedestrian, Johnny Hargraves, who hails from Yonkers, is eight years old, weighs sixty-five pounds and took around the track in a shape that would do credit to Weston. The effect of his passing some of his giant competitors was ludicrous in the extreme, and when with five minutes handicap, Johnny came in second he was perfectly overwhelmed with applause. The walk was won by O. D. Phillips (2 min. allowance), in 17m 25s. Hargraves' first mile was 9m 51-5s, and his two miles 19m 40s.

The fifth-of-a-mile race, over ten hurdles, was run off in heats. First heat won by Drew, of the N. Y. A., in 63-5s. The second heat was taken by Pierson, Waverley A. C., Livingston, H. A. C., second, time, 55s. The final heat brought out Pierson (20 yards allowance), Drew (15 yards), Frazier (15 yards), and Livingston (8 yards). Pierson won in 51.2-5s. Drew a cond.

The four hundred and forty yards race was run in heats. The first was won by Hilda, of the Nautilus B. C., in 55.3-5s, W. O. Wilkinson second. The second heat was taken around the track in a Morris by a foot in 36s, with Wm. J. Stewart so close that many thought it was a dead heat. The third heat fell to Richard Berger, of the Eclectic A. C., with C. E. Chapman, of Ridgewood, well up. The final heat was a good one, and was won by Stewart in 53-5s, with Chapman second.

Mr. F. N. Armstrong, who was to have attempted 8 miles in one hour, owing to the boisterous weather, finally decided to attempt only half the distance only, and succeeded in doing the four miles in the very creditable time of 29m 4.4-5s.

The one-mile walk, open only to members of the H. A. C., was won by E. Schlichting (55s allowance) in 5m 34s, with L. A. Berto (5m 15s allowance) second.

The half-mile walk was won by E. G. Gunser, of Station F Post-Office, an allowance of 20s, beating Chas. W. Turner (30s), of the N. Y. A. C., a short foot for first place.

For the grand steeple-chase, the track marked out was something less than a half of a mile, and passed by a circuitous route from in front of the grand stand out of the inclosure and over "dead-head hill," returning again to the starting point. The entries were Edward Merritt, scratch; A. W. Anderson, 20 yards; Wm. R. Stewart, 25 yards, and T. E. Bates 40 yards. Bates got off well, and putting on a good gallop kept well within himself, taking water jump and bush hurdle with ease. The race followed in the order named, but Merritt put on a great burst of speed and came near catching Bates, who let out a link and came home a good winner in 2:11—Merritt second.

**ORION ROWING AND ATHLETIC ASSOCIATION.**—This club engaged in a series of sports at the West Side Driving Park, New Jersey, Oct. 7. The 100 yard handicap dash, first heat, won by J. H. Van Loan, scratch; time 11s. The second heat won by J. H. Drew, 12 feet start; time 11s. The third heat, W. Wilson, 15 ft start; time 13s. The fourth, C. J. Rooney, 15 ft start; time 12-5s. The fifth, 15 ft start; time 11-5s. The final heat, John Van Loan, Drew second, Rooney third. Time 10-5s.

In the one mile walking handicap, with sixteen entries. H. Woley, 140 seconds start, proved the winner. W. B. Grattan, 180 seconds start, second; W. Goodson, 100 seconds start, third. Time, 9m 37-5s.

Hammer Throwing—W. F. Myers, 53ft 10in; D. W. Lawrence, 51ft 3in, and J. H. Van Loan, 47ft 4in.

One Mile Walking Match between F. J. Mott, of the Harlem Athletic Club, and S. D. Phillips, of the Hudson Boat Club, was won by the former. Time, 17m 47-5s.

Quarter-Mile Handicap—Won by J. H. Drew, 10 yards start; W. F. Myers, scratch, second; C. Hoo, 20 yards start, third. Time, 50s.

The Tag of War was won by Capt. Lawrence's team.

**Three-Legged Race.**—Won by Myers and Van Loan, distance 100 yards. Time, 14-5s.

**The Strangers' Half-Mile Race** was won by F. Hough, of the Hudson Boat Club; C. Myers, second. Time, 2m 23-5s.

**NEW YORK COLLEGE ATHLETIC CLUB.**—The contests in the games last Tuesday resulted as follows: One mile walk—first, E. E. Delamater; second, F. S. Williams. There were ten entries. The time was not taken. One half mile run, seven entries—Won by G. Upton in 2m 55s. One hundred yard dash, final heat, six entries—Won by M. B. Palmer; second, E. B. Sheehan, time 11-5s. Previous to these the championship contest was decided. The Senior team who beat the Juniors and Freshmen on October 27, were to pull against the Sophomores, but as the latter withdrew from the contest the '78 team, composed of Messrs. Boehne, Cohen, Doring, Nordlinger and Shumway, were declared champions of the college.

**COLLEGE FOOT-BALL MATCHES.—HARVARD VS. PRINCETON.**—This game was played at Hoboken last Saturday. The game was divided into two parts of 45 minutes, and played according to Rugby rules. The 15 players from Harvard College were Mr. L. Cushing, the captain, and Messrs. Thayer, Littner, Perry, Holmes, Swift, H. W. Cushing, Austin, Blanchard, Harrington, Houston, Holden, Lumbard, Bacon and Wethersby. The Princeton men were: Dodge, captain, Messrs. Cuts, Bradford, Ballard, Minor, Stevenson, Clark, Devereaux, Loney, Lee, Enos, Wiley, Irving, McNaair and Van Dyke. The hour set down for the game was 2 o'clock. Toward the close of the first 45 minutes Harvard gained a touch-down, during the second half Princeton won a goal, and as no other points were made, won the game. Both sides showed some excellent playing.

**HARVARD VS. COLUMBIA.**—These two teams met on St. Georges' Cricket Grounds, Hoboken, last Monday. The Harvard men soon showed that the game was theirs, and by some handsome playing made the following score:

Harvard—Cushing, captain. Rushers—Thayer, Littner, Perry, Holmes, Swift, H. Cushing. Half backs—Holden, Austin, Harrington, Bacon, Houston. Backs—Weatherly, Sheldon, Lombard. Columbia—Brower, captain. Rushers—Train, Potts, Lawrence, Brunkerhoff, Rhodes, Burton. Half backs—Pryor, Morfay, Do Forest, Ledoux. Hammond. Backs—Randall, McCosh, Conover. Umpires—Messrs. Seannans and Brown. Referee—Mr. Cuts, of the Princeton team.

Goals from placed kicks—Harvard, 5; Columbia, 0.

Goals from straight kicks—Harvard, 1; Columbia, 0.

Touch-down yielding goals—Harvard, 5; Columbia, 0.

Touch-down yielding missed goals—Harvard, 5; Columbia, 0.

Touch-downs for safety—Harvard, 0; Columbia, 7.

Fouls from throws—Harvard, 13; Columbia, 5. Touch-downs by Holmes, 3; Latteaux, 2; Cushing, 2; Thayer, 1; Perry, 1.

Kicked goals—Bacon, 1.

Goals from placed kicks—Cushing, 4; Latteaux, 1.

Rushes by Harvard, 21; Columbia, 13.

Scrimmages, 23. Field kicks, 31.

**CRICKET.**—The last game of the Manhattan Cricket Club last Tuesday was played with the disadvantage of a high wind and a soft ground. The contest resulted in a victory for the married men by the following score:

## New Publications.

**Shooting and Fishing in the Rivers, Prairies and Backwoods of North America.** By H. H. Revolt, Editor of the "Journal de Chasseurs." Translated by "The Chronicle." London, Tinsley Bros., 1895.

M. Revolt, in his preface, gives the key note to his book in the following quotation: "Sportsmen's stories are not Gospel truth," which we think the American reader will consider an appropriate introduction.

He tells us that he resided in the United States from 1841 to 1849, during which time he hunted and fished from Maine to Florida, and from New York to the Rocky Mountains. He consorted with Indians, trappers, squatters, whites and negroes. His Canadian Indians are described as being dressed in the skins of the buffalo and the peccary; he hunts in New Brunswick with Esquimaux, and in Florida with Caribs; and they all are of the conventional sort, picturesque and statuesque, using language the most poetical.

As to the negroes, his acquaintance with that race may be inferred by the following quotation from their speech, as used in describing the wild cat: "As greedy as a pawnbroker; as cunning as a briefless barrister; as fierce as a peccary, and as hard as a tortoise." In the same way does M. Revolt draw his descriptions of white squatters and hunters from the depths of his inner consciousness.

Among the new and wonderful things which this disciple of Saint Hubert, as M. Revolt is fond of calling himself, saw among the Indians, was the sport of hawking, of which he partook with

the Blackfeet and Oages. Few travelers have seen this, but it was reserved for M. Revolt "to participate in a kind of sport which (except in Holland and Scotland), is now quite extinct in Europe—hawking for herons." The description of the sport which follows might have been, perhaps, taken from one of Sir Walter Scott's romances.

Another remarkable instance of good luck which befel M. Revolt was the shooting of three panthers in one day "in the forests which extend along the Erie railway." With his usual accuracy he describes the panther as about the size of a large fox.

M. Revolt is somewhat vague in his geography, which is unfortunate, as it may prevent other naturalists from profiting by his discoveries. For instance, at the foot of the "Massaso Mountains in the stoppes of the New World," he found ostriches; and in a note he adds that he saw in the possession of a New York naturalist two ostriches which had been killed in Iowa; they were five feet in height, and had been sold for \$200—which was certainly a large price for a sandhill crane. This, however, is not the only discovery of M. Revolt in Zoology. He finds the grizzly among the Alleghenies, and the reebuck in Virginia. The caribou, he asserts, in his own observation, to be the largest and most formidable of the deer of America; and one of the most ferocious and dangerous of the carnivora of the United States, he thinks, is the coyote or prairie wolf.

The second volume of M. Revolt's book is devoted to the fishing of America, and here we meet with adventures unparalleled in the pages of FOREST AND STREAM.

Near Rochester, in company with a beautiful descendant of Amerigo Vespucci, he captured forty-five trout, of which eleven weighed from eight to nine pounds, three salmon and nineteen bass.

In 1846, M. Revolt met at the Eagle Hotel in Chicago one Simon Bergeron, a Canadian with a nasal twang, who invited him to go to his sugar camp on the Rock River, near Peoria; and here they killed in one day fifty-seven salmon, and a hundred and twenty-two trout. This was done, however, with the help of Bergeron's negroes, who hauled a seine. Many wonderful things were done in those days, but this was the greatest haul of all.

There are, also, thrilling adventures with sharks, astonishing alligator stories, and wonderful tales of the devil-fish and the kraken; but most of them seem to be old acquaintances, and the impression with which one closes the book is, that it has been made up from various sporting works, and represents a diligent use of the scissors and paste pot, rather than the rod and the rifle.

The Emigrant and Sportsman in Canada. By John J. Rowan. London, 1876.

The principal object of this book seems to be to attract immigration to the Dominion, and to warn immigrants from going to the United States. It does not appear that Mr. Rowan ever was in our part of the Continent; he came from England a typical John Bull, full of the insular prejudices against Republics and Republicans, and returned home strong in the belief that the native born American is "a slight, scrawny, lanky man, with poor muscular development, who comes of a stock that has had servants to do its work—from Africa, from China, and from Ireland."

"The Canadian," he says, "is robust and strong, being sprung from a well-grown and muscular parentage, he preserves the type;" and he evidently is of the opinion that instead of Canada being absorbed into the American Republic, it is the Dominion that is to swallow up the United States. As to the American woman, he admits "that she is pretty, but is old at thirty, and has only, or at most, two children." Standing on the other side of the St. Lawrence, Mr. Rowan has made other remarkable discoveries, historical and political. The territory of the United States has, he says, not been cleared and subdued by the Americans, but by Chinese and Irish labor. He has also discovered that North America is too large to be under one government, and believes that it will be divided into many republics or kingdoms. It seems hardly worth while to notice such feeble attempts at book making as these, but when Mr. Rowan turns to subjects which he understands, natural history and field sports, he is really an agreeable and instructive writer. He well describes the Fauna of the several provinces, and has evidently hunted and fished from Ontario to Cape Breton. He writes intelligently of moose, caribou and bear hunting, and gives the best account we have met with of the duck shooting of the Provinces, as well as the sport among the shore birds in summer. Upon angling, Mr. Rowan writes well, but we do not agree with him in his estimate of the black bass and the muskellunge, which he will not include among game fish. Probably he knows nothing of them, or it may be that the fact of those fish being native Americans may have weight in the insular mind. Certainly if Mr. Rowan had ever had a

four-pound black bass on a light rod in a swift current, or had tackled a fifteen-pound muskellunge, he would have written more respectfully of them. It has been said "that one touch of nature makes the whole world kin," and most men are friendly by the river side; but our author, even on a salmon river, still growls at the hated Yankees, and finds merit even in the mosquitoes, which he says prevent the Canadian lakes and rivers from being overrun by them.

Mr. Rowan maintains that the angling in Canada is the best in the world, and that the Restigouche is the first of Canadian salmon rivers. He is, we think, the first writer who has noticed in a book, the peculiar sea trout of the Nouvelle and the Escomiac, two beautiful little rivers which enter the Bay of Chaleurs opposite Dalhousie, whose fish differ in color, size and habits from those taken in other waters. We have no space left to notice in detail the directions to emigrants which appear to be sensible and practical, still warning the simple minded Englishman from the wiles of Brother Jonathan.

**Harper's.**—With the November number, Harper's concludes its fifty-fifth volume. These volumes form an exhaustless store-house of good things. History, biography, wit, literature, fiction, poetry, the scientific progress of the last quarter of a century, and a variety of minor miscellany—all are here represented by matter of sterling worth. The current number is richly illustrated and full of entertaining reading. Mr. H. W. Elliott tells us much of value and interest about the physical features of the fauna and people of Alaska. Then from that dreary waste we are transported to the strongly contrasted tropic lands of Western Texas, where Mrs. Harriet Prescott Spofford finds a theme in the historically romantic old town of San Antonio de Bexar. "Yachting on Blue Waters," by Mr. T. R. Warren, has the true dash about it. It is an excellent treatment of an excellent subject. Mrs. Gen. Fremont begins what promises to be a valuable series of autobiographical papers. Olive Logan has a paper on Houdin, "The King of Conjurers," whose exploits, even when explained, are mystifying. There are stories by E. E. Hale, Mrs. C. V. Hamilton, Henrietta Holdrich. Mr. Blackburn concludes "Eveva." The poems are by Ellis Gray, Helen C. Conant, Kate Hillard, Philip Bourke Marston and Fannie R. Robinson.

**Scrivener's.**—The opening article this month is one of the sporting series. This time Mr. W. McKay Laffon gives a description of the "Canva's, back and Terrapin." Another out-of-doors paper is "A Bed of Boughs," in which Mr. John Burroughs treats of tramping. Frank A. Stockton has a paper on the Island of Nassau. Col. Waring begins a series of papers on the "Saddled-horse," and Mrs. Herrick treats of "Bees." J. G. Stevens predicts the abandonment of "The Erie Canal." George M. Towle gives a sketch of Thiers; and those who are familiar with her portrait will be glad to learn something of the "Countess of Potoka." Edward Eggleston begins a serial story, "Roxy," of which the scene is laid in the land of the Hoosier Schoolmaster; and readers of "Lodusk" will find a curious counterpart of that character in Nancy Kirtley, one of the characters in "Roxy." Henry James, Jr., has a story; Bret Harte a poem; "His Inheritance" is continued, and there are a variety of other sketches, poems and stories.

**Appleton's.**—In the first illustrated paper Mr. J. W. Murphy describes, in a pleasant way some "Summer Ramblings in Washington Territory." The author finds abundant material in this almost terra incognita and has combined, with graphic pictures of the great rivers, forests and snow clad mountains, much that will enlarge our knowledge of the great Northwest, and will prove of value to future tourists. We have not for a long time seen a more fascinating subject than that treated by Mr. J. L. Burlingame, who, in his paper on "Dead Magazines," fittingly recalls the memory of the by-gone magazines of America. In short stories the number is strong. The sombre sketch, "A Whip of Scorpions," by Edgar Fawcett, contrasts with the brighter and highly edifying idyl "Extra-Hazardous," by Edward Bellamy, in which the tramp figures prominently and makes a most favorable impression on the reader. "The Game Knut Played" is a cleverly told poetical version of a clever trick, after the true orthodox order of the disguised prince wedding the haughty but pacified princess. The serial, "By Cella's Arbor," is continued; "Concerning Autumn" is by B. F. De Costa, and "Down the Valja," a bit of foreign travel by David Ker. There are a score of other good things, and the whole number is of exceptional merit.

**Lippincott's** opens with the concluding chapter of Lady Blanche Murphy's "Chester and the Doe," in which the old Roman ruins of that historic locality are described and illustrated. Then follows another illustrated paper on Baden and Allerheiligen, by T. Adolphus Trollope. These

## WHAT PRAIRIE OIL IS BEING USED FOR.

MR. KENWARD PHILLIP, late Dramatic Editor *Brooklyn Eagle*, Brooklyn, N. Y., was unable to walk without the aid of crutches, owing to a severe attack of Rheumatism. After the third application of PRAIRIE OIL the crutches were thrown aside, he having no further use for them.

Says the Proprietor of Niblo's Garden, New York: "PRAIRIE OIL gave me relief from inflammatory rheumatism after first application; and after the third I had no further use for my cane."

PRIOR ROSE, Esq., ex-Building Inspector, DeKalb avenue and Fort Greene Place, Brooklyn, says: "For acute or inflammatory rheumatism it is a wonderful remedy; has been in use in my family for over a year."

M. C. EDEY, Esq., the well-known chemist, 319 Court street, Brooklyn, manufacturer of Edey's Carbolic Troches, etc., says: "I find PRAIRIE OIL to be a most wonderful preparation in cases of rheumatism, having seen it tested in a case of years' standing. The patient obtained relief at once, and was ultimately cured."

MR. JOHN H. SNEDIKER, of Telfair & Snediker, oil merchants, 105 John street, New York, was cured of Pleurisy by the use of PRAIRIE OIL.

MR. G. PADDON, tobacco merchant, 992 Fulton street, Brooklyn, lost the use of his right leg by Sciatica, got relief at once after first application of PRAIRIE OIL. This gentleman had become so depressed by his affliction that he had given up all hopes of recovery.

CAPT. JOSEPH LA FIURA, Merchant Court, near Remsen street, Brooklyn, was cured of a stiff joint, of years standing, after a few applications of PRAIRIE OIL.

MR. BERTSON, publisher, 16 Beekman street, New York, says: "I find PRAIRIE OIL to be infallible in many serious complaints."

PRICE FIFTY CENTS AND ONE DOLLAR PER BOTTLE.

Ask your Druggist for it.

P. O. Box 2907. "THE PRAIRIE OIL CO.," 132 Nassau St., N. Y.

Sent prepaid by express on receipt of ten cents additional.

STEVE.

BY J. C. BURNETT.\*

"WHAT do I call the mule? His name is Steve,  
And you may hunt the country round  
For one that's got his sense. I don't believe  
A smarter beast's on top of ground.

"Ont on the plains, or over in the hills  
He's right at home, on any trail,  
And in the work that other cattle kills,  
To him there's no such word as fall.

"For five years now we've roughed it, Steve and I—  
He was a gift from Mountain Jim—  
And ever since that time, through wet and dry,  
He's stood by me, and I by him.

"We've had some hard old times, and that is so,  
In cold and rain and snow and heat;  
We've known exactly what it was to go  
For days without a bite to eat.

"And yet the old boy never said a word;  
He moseyed right along the same,  
And rose a hill as lively as a bird,  
To show me that he was game.

"You see those scars there, five or six in all?  
He got them over on James Peak;  
For once he missed his hold and got a fall  
That laid him up for many a week.

"The way it came was this: somehow, he hears,  
Or smells an Indian more'n a mile,  
And when there's any near he shakes his ears,  
Or twists them round in curious style.

"He does that, too, whenever his saddle slides,  
Or when his sinch is getting slack—  
A dangerous thing up on the mountain sides,  
Two hundred pounds strapped on his back.

"That day we climbed the Peak and started down  
Where first you see the river Grand;  
Just as we turned the mountain's snowy crown,  
Steve shook his ears and made a stand.

"'Aha!' said I, 'there's something he has spied;  
I'll go ahead and note the signs.'  
And so I left the mule securely tied,  
And went alone down to the pines.

"And that is where I made a big mistake,  
Because I feared some Indian rear,  
For Steven, by the signs he'd learned to make,  
Meant only that his pack was loose.

"The trail was narrow there, and very steep;  
The wind blew like a hurricane;  
In places snow was piled up awful deep,  
And clouds were threatening hail and rain.

"You may believe it was a lonely tramp;  
At last—the storm was getting nigher—  
I turned about to bring the mule to camp,  
At timber line, and make a fire.

"'Twas tiresome work, a-climbing that old Peak,  
It tries your nerve, as a general rule;  
And when I reached the spot, I couldn't speak,  
There wasn't a sign of any mule!

"Just how he came to fall is hard to tell;  
He likely turned to face the sleet,  
And missed his hold outside the trail, and fell,  
And down he went two hundred feet.

"Of course, I gave him up as dead enough,  
And went again the lonely tramp,  
Then struck a fire and thought it mighty rough,  
Steve out there dead, and me in camp.

"For hours I sat before the fire awake,  
With troubles piled up rather steep,  
Until at last, just as it came daybreak,  
I turned them loose, and fell asleep.

"I slept about an hour, and that was all;  
And when the sun began to gleam,  
I could have sworn I heard my old Steve call,  
Or else it was a curious dream.

"Straight up I sat, and then I couldn't stir,  
But listened while I held my breath;  
A little breeze was brushing through a fir—  
Excepting that, 'twas still as death.

"At last I heard the welcome call again—  
No dream this time, you'd better believe—  
And darn me if I didn't say Amen!  
As on the trail I met old Steve.

"The pack was gone, but that had saved his neck  
The ugly scars are there to tell  
How near he came to being a total wreck,  
And how I nursed the old boy well.

"Sell him? Well now, I rather reckon not,  
Not if I know myself, you see;  
To speak it all out plain, you haven't got  
The stamps to get that mule from me."

### The Lake Region of Finland.

ST. PETERSBURG, RUSSIA, Oct. 11, 1877.

EDITOR OF FOREST AND STREAM AND ROD AND GUN:—About one hundred and thirty miles northwest of St. Petersburg lies the lake region of Finland, if such a name can be applied to a system of water which covers about one-half of the country. The water is deep, clear and cold, and the bottom is of rocks and gravel. These lakes have many outlets into the Gulf of Bothnia, but one of the largest outlets is by the Imotra River with Lake Tadaqa, and so by the Neva into the Gulf of Finland. At the outlet of Lake Saima, where the Imotra begins its rapid and broken course, beautifully situated on a wooded knoll overlooking the rapids, stands an English club house, the "Naraka Club," composed of a few English gentlemen residing at St. Petersburg, who love the "gentle art." It was the writer's good fortune last month to be invited by Dr. —, one of the leading members and founders of the club, and one of its best fishermen, to pass the closing week of the season at Naraka. For, owing to the unwearied efforts of the club, there is a close season in that country of forest and lake, and the 15th of September sees all fishing, whether with rod or net, summarily stopped, and the fish left undisturbed during the five months of the spawning season.

Almost every peasant in Finland is a landed proprietor—rough and poor land generally, yielding a few stalks of oats or barley. Long before the sun can ripen the grain come the autumn rains, and then it must be cut and kiln-dried. Of course it is unsaleable, but it answers for the food of the family, and supports them through the long and trying winter. When the land of these peasant-proprietors adjoins the water they own to the middle of the stream, or to a certain distance into the lake. These riparian rights the Naraka Club hires from the peasants, paying what to us seems a trifle, but is a very large sum to the Finns. They thus become keepers for the club without wages, and make excellent guardians of the water. The owners are permitted to fish with hook and line, but not with nets. During the summer months they easily avail themselves of this privilege, for they are hired as boatmen by members of the club and by their guests, at about 75 cents a day—far more than they can make by fishing.

Leaving St. Petersburg by the Finland railroad at ten o'clock one evening early in September, dawn found us landed at a wayside station in the woods not far from Wiberg. There we were detained two hours, for the posthorses which ought to have been in their stables, were grazing or rather brousing in the woods, each with a bell hung to his neck to keep away the wolves. About five o'clock, however, five little two-wheeled carts, each drawn by a spirited Finnish pony, driven by its peasant proprietor, drev up at the station. The posting system in Finland is peculiar. Each proprietor must furnish so many horses with their drivers per annum, and have them always ready. They do it very willingly, for in that poor country they are very well paid for the work at three cents a mile. One passenger, with his traps and the driver, was allotted to each cart, so off we started. They are very tough and active those little ponies, and wonderfully sure-footed. The regulation speed is ten verots, about seven miles an hour, but civil words and a judicious "backsheesh" will easily raise the speed to nine or even to ten miles. But I do not recommend this mode of traveling to the fastidious. The carts have no springs, and as you jolt through the ruts you must hold on with both hands or be thrown out. My back was bruised for three days after my drive.

The roads in Finland are generally excellent, well graveled and well drained. The cross road we were on was an exception. A drive of two hours and a half brought us to Lake Saima. There we took a steamer—such would be a

better name for her. We coasted in and out among the islands in a channel as intricate as that through the Thames and Islands of the St. Lawrence, till two o'clock brought us to the landing near the club house. There two members who had preceded us, met us with the startling intelligence that one of them had just caught a true salmon. Then arose a discussion. For whether the true salmon is found in Lake Saima is as much a *questio verata*, as whether it is found in Australia. It is generally conceded that it is impossible for the fish to ascend the Imotra Rapids. There are reaches of a hundred yards or more, where there is not an eddy or a pool, where he may rest his weary tail—in unbroken rush of waters between rocky perpendicular banks. The Imotra Falls, by the way, are one of the sights of the country. People come from St. Petersburg to see them.

But, argued the pro-salmon party, the fish can come into the lakes by the Gulf of Bothnia, and so through the water system till they reach Lake Saima. This explanation, however, the opposition would not accept, contending that salmon did not run up the Gulf of Bothnia. So we left the subject where we found it. Each party perfectly satisfied with its own views, the usual result of all discussions.

Of course our first care after our arrival was for the inner man, which had been somewhat neglected *en route*. The question of food at Naraka is considerably involved. The country furnishes milk and excellent butter, and eggs of dubious character, for the Finns like them a little high. It furnishes good potatoes, too; and if you are on friendly terms with an adjoining proprietor, and compliment him with an occasional fish, he will compliment your in return with an occasional quarter when he kills. But he kills so rarely! Your principal articles of food, therefore, including corn bread, you must bring from the city.

After lunch a boat was assigned to each sportsman, and we paddled into the lake. You may fish with a fly, or troll with artificial bait. I tried both. With a fly you are quite sure of a nice mess of small trout, but if you go in for the big ones you must troll. On the edge of the rapids, just before the water breaks, lie the trout. Your boatman takes you as near as is safe, and you let your line drift with the current into the rapids. A jerk! and you reel in. You think from the strain on your rod that you have hooked a monster, but you soon find that it is the current that gives weight to the fish, and when you have reeled him well out of the rapids you discover that you have a little fellow of one or two pounds only. After taking five or six of these gentlemen, you pull further up to the point where the lake narrows into the river. There are the big ones. "Lochies" the natives call them, no matter what species they may belong to. Lake and brook trout, grayling, salmon, all are "Lochies" if they rise over six pounds in weight. There you let out more line, twenty or thirty yards, and await the result. Your boatman pulls gently, and wets or greases from time to time the plaintive oar-lock. A bite! and you quickly throw up the end of your rod. For a moment you are in doubt whether he is a big or a little one. For a moment, too, the fish pauses as if amazed, then off he goes like a shot. And now the sport begins. You are seated in the stern of the boat, you drop upon your knees, so as to face the enemy, your reel hums, your pliant rod—and you need a pliant one—bends as if it would break. But you keep the end well up that he may not rub his nose against the bottom, and if you feel that he is securely hooked you even check him a little lest he should reach the rapids. "There he is," as he leaps from the water in a vain effort to free himself from the hook—a brook trout of at least fifteen pounds! "Leap again, old fellow; the more you do of that the sooner you will tire yourself out." "There he goes again!" And now your line suddenly slacks, and you cannot help feeling some painful misgivings. You reel in as if your life depended upon your speed, when suddenly there is another rush, and off he goes again.

In the meantime your boatman, if he is a good one, has been quietly aiding you as you play your fish. Turning the boat so as always to keep your face to the enemy, pulling quietly when the fish is pulling hard, and rapidly when the line is slack, but all the time gradually approaching some well known spot on the shore where the water is deep and free from those harrows, snags and rocks. At last you feel the keel grate under you, and you land. And now the fish is getting tired, and you reel him slowly and carefully in, looking

\* MR. EDITOR:

WASHINGTON, Oct. 31, 1877.

I cannot agree entirely with Mr. Ingersoll in what he says of the total depravity of the mule. My experience has shown me that when they are well treated, and not abused, one can get a good deal of service out of them.

J. C. B.

out for his final rush when he catches sight of you or your boatman. The boatman takes his gaff and stands in the stern of the boat, or on a jutting point. Gradually the fish comes rolling in, but as the boatman raises his arm he is off like a shot. But you are on the lookout and let the line run freely. It is his last effort. You reel him steadily in. The boatman with one motion strikes the gaff into the fish, and raises him into the boat, and at your feet lies a spotted beauty of sixteen pounds and a half.

The broken water below the rapids is full of fish, though here they run small. I took two, one of two and the other of three pounds, at the same time. One with an artificial minnow of India rubber, the other with a salmon fly. The minnow is light, and plays with the rapid stream on the surface of the water. But the end of the season was approaching. We had considerable discussion whether it ended on the evening of the 14th, or on that of the 15th, as the law was not clear upon the subject. But we decided that all laws should be interpreted in a liberal sense, and concluded to fish all the 15th. And glad enough I was that we did so. All day long there blew a nasty, cold, northeast wind, the worst for fishing that can blow. The fish would not bite; but at dark I tried them again. I suppose they had got hungry by this time, and wanted their dinners no matter which way the wind blew. Pretty soon I landed a two-pounder. He was a lively little fellow, and made so much play that I thought in the gloaming that I had a big one. Then came a jerk and a rush, and I could just distinguish, thirty or forty yards off, a dark object throw itself into the air, and hear its splash as it fell back into the water. Fifteen or twenty minutes of conscientious work landed him safely. Another jerk and rush, and after twenty minutes more another big brook trout lay alongside of his brother. These two fish weighed thirteen and a half pounds each, and so closed the season. These fish are as delicious as they are gamy. I never tasted such high flavored trout—entirely free from the muddy flavor of so many of our fish at home. The Finnish women, too, though not exactly "cordons bleus" in the Catholic sense of that term, cook fish deliciously.

We were fortunate in our company at Nara. We had among us gentlemen who had seen much of the world, and especially of the Russian world, and their conversation was interesting and instructive. We dined late, for the best time for the big fish is when it begins to grow dark. Then they feed, and then, too, they are more easily obtained by the mimic minnow. We were not without poeks, too, among us. When the fish would not bite during that northeast blow on the morning of the 15th, one of our poets sang as follows:

#### THE SONG OF THE FISHES.

New joy at Nara, new glee in the lake,  
No longer shall M—y our big Lochies take,  
Close season has come, for months we are free,  
And we flop our fish tails at the parting Tengies.

Nara, Sept. 15, 1877.

The Doctor whose name should fill the blank in the above poem, completed the poem as follows when I returned late in the evening with my three Lochies:

P. S.

Too soon, alas! my joyous fish,  
Did boast we had escaped the dish,  
A Yankee came with cruel hook,  
And from our midst three Lochies took,  
And now our joy and glee we hide,  
And dop our tails on t'other side.

As I have not a copy of the Doctor's "Lament" by me, I may do injustice to its poetic merits, but I give it as I remember it.

Deep in Lake Saima there lurks a large fish. He is sometimes seen on a summer's evening as he gambols with elephantine playfulness on the surface of the water. We saw him leap, and an English M. P. of our party spoke the general sentiment when he said that he "was as big as a donkey." Innumerable are the hooks he has carried off, and the lines he has snapped like pack thread. The bottom of his den is strewn with hooks and lines and broken bits of rods, as the cave of Polyphemus was strewn with the sad proofs of his prowess. I am going for that fish next summer. W. H.

## Fish Culture.

**TROUT PROPAGATION AT PALENVILLE.**—The trout hatchery at Palenville, built under the superintendence of A. W. Marks for the Committee of the Board of Supervisors, is copied after the New York State hatching-house, designed by Monroe A. Green, who is the most successful fish-culturist in the country. Mr. Green is now at Cape Vincent, Jefferson County, superintending the taking of salmon trout. Mr. Marks is now progressing finely at Palenville, taking spawn daily. From the sources of supply now open to the committee, it seems probable that the hatchery will distribute to the various towns in the county from 300,000 to 400,000 young trout next spring. The committee, Supervisors Breasted, Mulford and Holcomb, aided by Mr. Hopkins, have proceeded carefully and made no mistakes, and the result of their labors will be of substantial benefit to the country. Mr. Marks pronounces the streams of Ulster County the best he has ever seen for trout purposes, and it is not unlikely that the supervisors of Ulster may conclude to stock their streams also.—*Catskill Recorder*.

**VEGETABLE GROWTH IN FISH PONDS.**—Our respected friend and well-informed editor of the *Germantown Telegraph*, gives his readers some really valuable information, gathered from his own experience, in regard to the kind and quality of weeds to be cultivated in fish ponds. We have endeavored for years to inculcate upon fish breeders the absolute necessity of planting something of the kind. No fish pond should have an entire gravelly bottom. It should have some mud. Aquatic plants grow from mud. Our readers who angle for trout will recall to their remembrance that the best natural trout streams which they ever fished had a growth of weeds and lily-pads at their mouths. Such a stream generally runs over a gravelly bed, but it carries with its current particles of mud, silt, seeds, pollen and earthy matter, which, floating down to the point where the force of the current expends itself, is deposited on either side of its debouchure. Out of this deposit the weeds grow in a semicircle, their tops floating in a mass upon the surface, and leaving an oval space of clear water. Our readers will recall the fact, also, that in all natural ponds, which are fed by bottom springs, the weeds and lily pads

grow in circles around the spring-holes, the gushing water throwing off particles of earthy matter on all sides. Expert anglers will always fish in the open water along the edges of these weeds, not only because the trout are attracted to them by the purity and coldness of the water, but because the plants breathe out oxygen, and supply food in the shape of larvæ and mollusca, as well as shade, shelter and security to the trout. Some plants are more attractive than others; and just as the gardener selects and disposes his plants with a view to utility and beauty, so will the aqua-culturist use like judgment in placing plants in his ponds. But let us hear what the veteran editor of the *Germantown Telegraph* says about this:

No fish pond should have an entire gravelly bottom. There should be some mud. Here the water-lily should be planted. All fish in a pond like this plant, and its flowers floating on the surface make a very beautiful appearance. Then there is the calla lily, which can be set with the pots where the water is not too deep, and will grow and bloom all summer. We have tried both and find them always surrounded with gold fish and others. Next allow the grass to grow along the edges of the pond into the water. It will be a cover to the fish in protecting them against the sun, and will admit of their eating fresh soil and some of the tenderer fibres of the grass-roots. By these the water becomes much more life-sustaining by reason of the oxygen supplied.

We thank our contemporary for his courteous reply to our inquiry for light on this subject, and trust that other intelligent gentlemen will follow suit. We have much yet to learn on the culture of aquatic plants.

BEDFORD, O., Nov. 9.

MR. EDITOR:—The last number (Nov. 1st) of *FOREST AND STREAM* is received, and, like every number, without exception, is good. I like the article on the growth of trout, but still think those six and seven inch fellows were old fish. I also think Mr. Page's half pound trout was at least three, if not four years old. Brook trout do not grow rapidly before they are two years old—at least, that is my experience with them. I hope this subject will be thoroughly investigated, as it is of some importance.

The immense size of the Maine trout have always been a marvel to me—why they should be so much larger than the trout of the Lake Superior region I do not understand—six pounds three ounces being the largest brook trout I ever saw, taken at Sault Ste. Marie. \* Yours truly, T. GARIBOLD.

—The San Francisco *Sunday Chronicle* says: "The catfish have increased so much in numbers in Sutter Slough that it is proposed to remove the restriction upon catching them, the Fish Commissioners being satisfied that the fish have become so numerous there and in other waters in which they were planted that there is no danger of their being seriously decreased by ordinary fishing. They have also begun catching them in throw nets for stocking the Sacramento River."

Why don't they put up some of those anchovies which we hear about on the California coast around Santa Barbara? They can make the oil in the country, and there is no reason why we should not have American anchovies to compete with the French and Italian products.

**GROWTH OF BLACK BASS.**—Facts of interest regarding the growth of fish are gradually coming to light. Why don't the four score fish breeders and ichthyologists who take the *FOREST AND STREAM* jot down little items of information like following?

MORRISTOWN, Nov. 9, 1877.

#### EDITOR FOREST AND STREAM:

In your paper of Oct. 11 I saw an account of the rapid growth of trout from the pen of W. H. Hasbrouck, of Ellenville, N. Y. The statement which he makes is certainly very encouraging. I wish to say a word about black bass.

One year ago this fall there were placed in D. L. Miller's pond at Madison, in this county (Morris) fifty of these fish measuring from two and a half to four inches in length. On the 17th of October, about one year from the time of putting them out, Mr. Miller had occasion to draw the water down for some repairs. He had the dam arranged as to take any fish that might run out. Eleven bass were caught. They measured from ten to thirteen inches in length, and were undoubtedly the same fish which were put in the year before, as none of this variety of fish were ever known in the pond before. This is the first time that I have had an opportunity to observe their growth. This is a little fishy, but has the merit of being true.

CHAS. J. PEARSON,  
Fish Warden for Morris Co., N. J.

**BIRD HABITS.**—The Greensburg (Penn.) *Herald* of the 6th inst. says: "There are about 100,000—more or less—birds (black or cow birds) that have established a 'roost' in St. Clair Cemetery, and, just as regularly as the rising of the sun, these birds leave their roost between daylight and sunrise, and in one immense flock wend their way westward. Just exactly where they go we know not, and, after foraging all day, they return between sundown and dark and take up their lodging for the night on trees in the cemetery. Can any one give a reason why those birds selected the cemetery instead of other woodland for their roost? Or why they all congregate together at night and all leave at the same time, and all go west, and never east, south, or north?"

We can't give the be'causes of the birds roosting in the cemetery, but possibly there may be some winter wheat due West. The examination of the crop of one of those black birds would soon determine this question.

**DRUMMING OF RUFFED GROUSE.**—"Splasher" asks: "As it seems still to be a point of discussion how the ruffed grouse drums, would it be out of the way to suggest as a reasonable supposition that they do it with their drum-sticks?"

**A HINT TO CATERERS.**—The older men grow, and the more teeth they lose, the more oysters they eat. Cultivate the agent.

—The average mid-day temperature at New Smyrna, Fla., for the month of October was 79 deg. 4m.

THIS DEPARTMENT IS EDITED BY W. J. DAVIDSON, SEC. N. Y. HORTICULTURAL SOCIETY.

### ENGLISH NAMES OF WILD FLOWERS AND PLANTS.

THE following lecture by the Rev. W. Tuckwell before the Somersetshire (England) Archaeological and Natural History Society is so interesting and instructive that we offer no apology in placing it before our readers:

Eight years ago I was piloting a famous botanist from the east of England among the fields and lanes round Taunton, when he asked me the name of a plant which he did not at the moment recognize. I answered that it was the Gipsywort, and received a prompt rebuke. "This is the third time," he said, "that I have inquired the name of a flower, and you have answered me in English. The Latin names are universal, the English at best are local. It is to be wished that all English names of plants could be forgotten, and their scientific names become popularized instead." Unquestionably a foolish utterance, it was of great service to myself, for it set me to consider the real value of these names which my pedantic guest despised, and from that time to this I have never encountered the popular name of any English wild flower without questioning it closely as to its etymological history and meaning, and noting the passages in our literature where it occurs. It would be a great pleasure to me to believe that the knowledge gained by these inquiries, put together to the best of my power, could interest you to-night as much as it has interested myself.

It is no new thing to infer from the terms in use at the beginning of a nation's history the arts and customs of the nation using them. Thus the fact that in all or nearly all the Aryan languages the words for the Supreme Being, for the king, for brother and sister, for plowing, grinding, building, closely resemble one another, is admitted to show that our common forefathers in times when they were still one people, and had not yet scattered into India, Persia, Europe, had the beginnings of religion and government, possessed the family life, knew the simple arts which are most needed for the comfort of home life. Let us see what light will be thrown upon the habits of our Teutonic forefathers if we apply their method of investigation to the popular names of plants.

#### TEUTONIC NAMES.

The following words are common to all the Teutonic languages—must have been known, that is, to the race from which we ourselves, with the Germans, Danes, Swedes and Norwegians, are descended, on their first settlement in Europe, and before they broke up into sub-divided nations. The first I will take is birch, the kind of which must, we find, have been used for boat-building and for roofing houses; for boat-building, since the word "bark," from the same root as birch, stands for ship in English, Dutch, Icelandic, Danish; for roofing houses, since the old English *bergan* and the German *bergen*, also from the same root, mean to cover, protect, or shelter. From this simple word, then, we gather that our ancestors possessed the arts of building boats and of roofing or thatching houses. Houses could not be built without timber, and we find the word "tree" in almost every Aryan language standing for three things—for a tree, for timber, and for an oak, extending the use of oak wood for building purposes back to the first formation in Asia of our mother language, and presenting us with the additional facts that our European ancestors built of oak timber the houses which they roofed with birch. In Hazel a fresh fact lies buried. It is in all Germanic dialects the instrumental form of *hax*, command or behest, a Hazel stick having been used, as Jacobi Grimm informs us, in the earliest times as a sceptre or baton to keep order among slaves and cattle. Without dwelling on the fact that the old word *halsian*, to foretell, indicates the use of the hazel rod for purposes of divination, we have the additional probability revealed in a single word that our remote ancestors possessed slaves and cattle. In hawthorn, common to Swedish, German and English, we have testimony to the use of a haw, *hæg*, hedge, or fence, "honouring the holy bounds of property," and consequently to the division and appropriation of land, in the earliest Teutonic time. My next word makes some demand upon your etymological credulity. Without tracing particulars, I will ask you to believe that the Sanskrit *Ksh*, to dwell, passes through various forms in one direction to the English "home," in another to the word "heath," now meaning the plant which grows wild on open land, standing originally for the land itself. "My foot," says Robt. Roy, "is on my native heath," and the same idea was enshrined in the same word to the first Teuton settlers. In the forest he fought his enemies, hunted his prey, hewed timber for his fences, and peeled timber for his roof; his home was in the open land, or heath, from which, again, when ages had passed away and Christianity possessed the towns, he still worshipped his father's gods upon his father's heath, and gained, as Trench thinks, his ancient name of heathen. A sixth word lifts him higher than all the rest. The word beech, in Gothic, old High-German, modern German, Norse, Danish, Dutch, English, is identical with beok, the Runic tablets of our ancestors having been carved upon this wood. In sloe, the wild plum, we have the root of "slay," its tough wood having been used for bludgeons; dogwood is daggerwood, from *dag*, to strike; from ash, whose wood was therefore used for spear-shafts, came the old English *æsc*, a spear; sedge is allied to *scæg*, a sharp, small iron sword. And let us observe that while all these plants, bearing purely Teutonic names, extend far into Northern Asia, trees which stop short at a more southern limit—the elm, chestnut, holly, sycamore, plum, pear, peach, cherry—all have Latin names, showing that the Teuton squatters came from a colder country than that in which they are supposed to have settled near the Roman provincials on the Lower Rhine. The knowledge that wheat, barley, oats, corn, rye, are all Teutonic words, completes the historical picture given by the first list of names. They show us a race of men coming from a northern to a southern region, dwelling in timber houses, roofed and thatched, launching boats upon the rivers, possessing cattle and slaves, recognizing the rights of property and the sacredness of home, fighting with daggers, swords and spears, familiar with cereal agriculture, in some way not ignorant of letters. All these facts, just hinted at here, but challenging minute investigation, we owe to a dozen common names of English plants, whose Latin equivalents teach and commemorate nothing of any national interest to ourselves.

## GREEK AND LATIN NAMES.

These names and a few more, are as old as the English language; but from the conquest to the sixteenth century botanical inquiry ceased in England, and the rest of our popular names are little more than 300 years old. Most of these come to us from the Greek and Latin. Any scholar will detect in *Acacia* the Greek word for guilelessness; in the *Amaranth*, with which Milton's worshipping archangels wreathed their brows, the Greek for unfading; in the periwinkle the *periwinkle* used to bind about the head; in lettuce, the meaning of milky; in geranium, the descriptive name, crane's bill. In the plane he will see the *planatus* of the poets; in the rose, the *rhodon* of Homer and the *rosa* of Virgil; in the sycamore, the wild fig of the Bible, transferred in medieval miracle plays to the tree which now bears the name; in the vine, *vinum* and *cinum*, whose Sanskrit root is still present in our words *twine* and *twist*. He will understand that the basil, which poor simple Isabel planted in the pot which held her murdered lover's head, was the regal plant, used perhaps of old in some royal bath or unguent; that the *Angelica*, which now flavors our soups, and was once a specific against the plague, was given to mankind by angels; that the *belladonna* was applied as a cosmetic to make ladies beautiful for ever; that the cyclamen, which still grows wild in Devonshire, owes its name to its prominent circular tuber. He will not so readily discover that the tansy of our cottage gardens is the Greek *athanasia*—immortality, administered to Ganymede that he might become fit for his life in heaven; that the common Milfoil yarrow is the *hieracium*, or holy herb, pledged to heal all herbs with its fragrant leaves; that *Nasturtium* means nose-twister, from its pungent smell; that our Quince whortleberry is a corruption of *myrtillus*, myrtle-berry; that *Elaeagnus* is *avellana*, the prickly rose, or sweet briar; that the herb Bennett or *avens*, is the *benedicta*, blessed herb, kept in houses to prevent the entrance of the devil; that the hip of the dog rose is a form of the Greek and Latin words which, people afflicted with sore throats know as jujubes; that liquorice is an Anglicism of the Greek *Glycyrriza*, sweet root; that the larch is from the Latin *lar*, a house, in consequence of its use in building; that lavender, from the Latin *lavare*, to wash, was in the twelfth century Scotch and northern English for washerwoman, because then as now its sweet spikes were laid among fresh linen; that the service tree is the Latin *cerevisium*, beer—its leaves having been used to flavor ale before the virtues of the hop were known; that the little Squinancy wort was the ancient remedy for the disease *kyananche* or dog-choker, which we know in its modern sound as quinsy; that the mushroom is the muscarius or flybane, because a particular *Agaricus*, pulverized and mixed with milk, was used in Southern Europe as we now use the poison called "Keating's Insect Powder." Least of all will our scholar be quick to admit that the Narcissus owes nothing to the love-sick youth over whom Ovid sung and Bacon moralized, but is connected with the Greek *narkodes*, sluggish, a derivative from *narké*, the torpedo, itself sprung from the Sanskrit *narik*, hell; cited by Sophocles (Ed., Col., 632), as crowning the gods of Hades; gathered by Proserpine before her wedding tour into the same dark region, because its heavy odor (for by it the ancients meant the hyacinth) blunts the nerves and makes men sleepy and torpid.

(To be Continued.)

## MUSHROOMS AS FOOD.

EDITOR FOREST AND STREAM:

Some years since, while on a visit to my friend, Prof. J. T. Kirkland, in looking through his extensive library, I came across a rare old book written by a German naturalist on mushrooms. He stated that any mushroom that had a pleasant odor and taste when cooked was a perfectly safe mushroom to eat. I have tested this rule on a great variety of mushrooms, and have found it invariably correct. I do not know how many kinds of mushroom I have eaten, but very many, all good, some even better than the *Agaricus campestris* (the common pink-gill mushroom), while I have found very many that were not only edible, but delicious. There is no difficulty whatever in detecting a noxious or poisonous mushroom by its odor when cooked; its rank, narcotic odor informs you at once and unmistakably of its noxious character. In making the test by cooking, use no seasoning but salt; lay the mushroom, gills uppermost, on a hot griddle or coals, sprinkling over the gills a little salt; when cooked through lift it with a fork to the nose; if it emits a good you need not hesitate to gobble it at once. The object in using no seasoning but salt, is to avoid any artificial odor caused by false seasoning.

T. CHARLES, Bedford, Ohio.

[It is well, however, always to err on the safe side, and though we know that immense quantities of many varieties are used, more especially by the peasantry of Norway and Sweden, Russia and Austria, yet a paragraph like the following teaches us to be very careful what unknown sorts we eat, until at least we have given them a very careful trial. We believe our correspondent's method is a first-rate one. There is a much larger number of species of mushrooms edible than people imagine, but, unfortunately, few are intelligent enough to distinguish them.—Ed.]

**POISONOUS MUSHROOMS.**—"The neighborhood of Agen has," says a correspondent of the *Garden*, "been placed in a state of consternation by the death of eight members of the same family through eating mushrooms. This fatal example is a warning for those who persist in the use of mushrooms of doubtful quality."

**KEEPING ROOTS.**—To keep roots sound and plump, Mr Benjamin P. Ware, of Marblehead, a successful gardener, cuts off the fine roots close to the body, and pares away the crown of the turnip or beet sufficiently to destroy all buds or rudiments of buds. The thus doctored roots are then placed in barrels of sand or covered with earth in the cellar to prevent wilting. Removing the buds and rootlets prevents that corkiness so common with these roots when kept till late in winter, which is caused by the support of sprouts and rootlets using up much of the more tender and edible substance of the roots. Turnips and beets thus treated are as nice for the table in late winter or early spring as when first harvested.—*Seeventy Farmer*.

**W. PETERS, Louisiana, Mo.**—We find the *Bryophyllum*, or life-plant, offered by P. Henderson, N. Y., at 25 cents each. Its culture is similar to any ordinary house plant. It is really more curious than beautiful, yet its peculiar habit of making young plants at the serratures in the leaves gives it great interest.—Ed.

**THE CYPRESS AS A SHELTER TREE.**—In regard to trees for shelter, the cypress is thus recommended by a writer in the *Anaheim Gazette*: "I am convinced that for shelter and windbreak there is nothing equal to Monterey cypress, planted about twelve feet apart, and left untrimmed after the first two years. One near my house, twice changed in place, and not four years from the seed, and closely trimmed each spring, is now fourteen feet high and eight feet through. A line of such trees would dispose of the sun and raise the temperature. For beauty no tree can equal it. I recommend twelve feet apart, for we do not want to destroy the refreshing sea breeze, but only to control any undesirable blasts, whether from the sea or from the desert."

—The corn husks are thin, indicating a hard winter; the woods are full of mast, an unfailing sign of a long, hard winter; there are myriads of spiders, mild winter; acres of caterpillars, hard winter; the squirrels are idle and listless, mild winter; the squirrels are noisy and busy, hard winter; goose bone is white and gray, mild and hard winter; the woodchuck has gone in, mild winter; the woodchuck stays out, hard winter. It is, indeed, only a question of time, when the system of weather prognostications will become one of the exact sciences.—*Burlington Hawkeye*.

**NOTICE TO SPORTSMEN.**—Having received so many communications asking us for information in regard to our six-section bamboo trout, black bass, grise and salmon rods, we have prepared a circular on the subject, which we shall take pleasure in forwarding to any address. We keep on hand all grades, the prices of which range from \$15 to \$150. We put our stamp only on the best, in order to protect our customers and our reputation, for we are unwilling to sell a poor rod with a false enamel (made by burning and staining to imitate the genuine article) without letting our customers know just what they are getting.

P. O. Box 1,291.—[Adv.] ABBEY &amp; IMBRIE, 38 Maiden Lane.

## Natural History.

BRANT.

"Still harping on my daughter."

EDITOR FOREST AND STREAM:

Some months have passed since the brant question has been discussed in your columns. I have heard of many inland brant, and have requested that such might be sent to me for inspection. None have been received. From Dr. Coes' letters and other letters, I think the brant may have been found on our northern lakes. Can we not establish this fact, if it is a fact? If any person will send me by express to Kensington, Cook Co., Illinois, within the next three months, a specimen of the true brant, *Branta borealis*, killed in its wild state, one hundred miles from salt water, I will be responsible for the safe return of the specimen, and accompany its return with ten dollars, and pay all express charges. I trust that this article will not be regarded as pertaining to controversy; but, as it is, intended to lead us to facts, which every ornithologist should be desirous to reach. GREENE SMITH.

Petersburg, N. Y., Oct. 27th, 1877.

[See Coes' Birds of N. W., p. 537.—Ed.]

Mr. Greene Smith's enthusiastic prosecution of this interesting subject ought to be respected. We trust our Western friends will comply with his request. We are personally aware that the question is of great interest to them. They have told us so. However, we have not conversed with a single gentleman in Michigan, Wisconsin or Minnesota who was prepared to say that the so-called brant of the West was the true brant with which Mr. Smith would doubtless be glad to identify it.—Ed.]

**BREEDING OF THE WILSON SNIP.**—In his recently published list of the birds of Connecticut, Mr. Merriam speaks of a nest of this species being found in that State. He says:

"Mr. W. W. Coe and Mr. J. H. Sage inform me that they took a nest containing three fresh eggs of this species at Portland, Conn., May 13th, 1874. The eggs were fully identified, as the parent bird was found on the nest. It was not previously known to breed so far south as Connecticut. The nearest approach to it is a set of eggs in the Smithsonian, labeled *Oncida* Co., N. Y. Mr. Coe tells me that there was a number of snipe in the field at the time, and he thinks there were other nests which they did not find."

**RUFFED GROUSE, PHEASANT AND PARTRIDGE.**—Mr. C. O., of Ronceverte, West Virginia, a well-known writer of intelligence, sends the following excerpt from the *Germantown Telegraph*:

We agree with the *Sunbury Gazette* that we should call game birds and game fish by their right names. What do we want better or more distinctive than partridge, pheasant and grouse? Why say quail, pinnated grouse and ruffed grouse, when the pheasant is no grouse at all?

C. C. asks: "Is it not a little 'rough' on the grouse? and if so, what becomes of the statement that the pheasant is no grouse at all? I should say a 'roughed' grouse most assuredly—wouldn't you?"

We can hardly believe that the editor of the *Germantown Telegraph* endorses the nonsense in the *Sunbury* paragraph. He knows better. We are all liable to slips of pen and tongue; but one slip ought not to hang a man, although it is apt to do so when the rope don't break.—Ed.]

**THE CAPECALIZIE AT PLAY.**—The *Capercalzie*, or "cock of the woods" (*Tetrax uro-gallus*—Linn.) is the largest bird of the grouse family, and inhabits the pine and spruce forests of northern Europe. He performs his play in spring-time, at the break of day, on some of the lower branches of a tree. Each song or play consists of three different notes, the first expressed by the word "pellet," which is repeated a number of times, and wound up by a single guttural note called the "klunk," immediately followed by a hissing noise, which may be imitated by opening the lips slightly and drawing the breath through the closed teeth. During the first part of the play

the bird is wide awake and looks sharp around to discover any danger, but after the "klunk," and while emitting the last cadence he is perfectly dead and blind, giving the hunter an opportunity, while it lasts, to take three or four rapid strides forward, and thus gradually approach within range.—*John Swainson, to F. and S.*

**SHELLS IN RED HEAD DUCK'S CRAW.**—Mr. J. R. Sutton, of the San Francisco Packet Line, 117 Wall Street, has kindly informed us that the shells we have twice referred to are not *Forminifera* as we supposed, but that they are *Littorina* *ombica*, and inhabit the Gulf weed. During strong easterly gales these weeds are blown toward our shores, so we cannot see from these or the seeds whence came the ducks in whose craws the shells and seeds were found.

**ARRIVALS AT PHILADELPHIA ZOOLOGICAL GARDENS FOR WEEK ENDING WEDNESDAY, Nov. 6, 1877.**—Three ring doves, *Turtur risoria*, presented; one kangaroo rat, *Hypsigymnus rufescens*, born in garden; three common marmosets, *Haipale jacchus*, purchased.

A. E. BROWN, Gen'l Supt.

—Holabird, the shooting suit man, of well-known fame, writes us that, notwithstanding the great competition in business, he is still as busy as possible.

## The Rifle.

**MEETING OF THE NATIONAL RIFLE ASSOCIATION.**—The Board of Directors of the National Rifle Association held a meeting on Tuesday last, Judge Stanton the President, in the chair. Treasurer Wylie showed the receipts for the past month to have been \$3,480 61; expenditures, \$3,329 18; balance on hand, \$160 23. Col. Ward, on behalf of the Prize Committee, submitted designs for a trophy to be presented to the winning team in the Inter-State Long Range Match last Fall, together with a gold badge for each member of the winning team. The design for the team trophy represents a large and handsome silver urn. Col. Wingate, in behalf of the Range Committee made a report in which grave charges were preferred against the action of Gen. Millen, at the range on a certain occasion, and a statement denying the charges was read by Gen. Millen. The matter was then laid on the table until the next regular meeting of the board. Col. Gildersleeve, on behalf of the Committee on "Alias" Names, offered a resolution abrogating the privilege to competitors in rifle matches at Creedmoor, of using assumed names in matches. The motion was adopted. The report of the Committee on the American team of 1877 in favor of paying each member of that team \$200, in accordance with the resolution passed last spring, guaranteeing each member of the team that amount to defray expenses, was adopted. Gen. Woodward, the executive officer in the late Fall meeting, presented a voluminous report, in which it was shown that the receipts from all sources at the meeting amounted to \$9,592 45. He recommended that in future prize meetings all members should be limited to seven shots, each shot to be fired within one minute, and that "ties" should be shot off between competitors for first prizes. A motion to increase the salary of the Assistant Secretary was referred to the Secretary, and a similar motion reducing the salary of the Superintendent of the range was referred to the Range Committee.

**MASSACHUSETTS—Worcester.**—On Friday last a match was shot at the Greenwood Range for a prize of a heavy gold badge, presented by N. Washburn, Esq. Distances, 800 and 900 yards. Fifteen shots at each range. Heavy storm prevented the whole match being shot. The following are the scores:

|                               |                                |
|-------------------------------|--------------------------------|

| D. Kirkwood.....24     | 44 | 26 | 104 |

At a friendly competition between the Attleboro' and Walpole rifle clubs, the Walpole team won by 130 points.

**Boston, Saturday, Nov. 10.**—A match took place at the Walpole range, in Walpole, between the Walpole and Massachusetts Rifle Associations. The weather was bad with strong head wind from the East, and, in the latter part of the contest, rain. At the 800 yard range the Massachusetts led their opponents 26 points, but at the 900 and 1,000 yard ranges the Walpoles took a lead, and eventually won by two points. The highest score at the three ranges was made by A. P. Clark—201. The shooting by both clubs was good, considering the weather. Following is the score:

| WALPOLE TEAM.                  | MASSACHUSETTS TEAM.            |

would certainly win where a united team has lost; but we believe that experience has shown that an Irish team, as such, can do better work than when commingled with men of whom little is known. Let us take the conditions under which a united team is formed, and we shall see that they are utterly opposed to the theories laid down by Mr. Rigby and by Major Leech, and to the practice of the most successful rifleman alive. The best of the English, of the Scotch and of the Irish are taken; but what do they know of each other? The men find themselves shoulder to shoulder; but there is no interwoven sympathy, the result of steady practice and mutual assistance. We believe our United Kingdom team is in its very essence a mistake; and we object to the Irish having to add to their already long list of disabilities the woeful honor of sharing in a defeat which is pretty well a foregone conclusion. That this is not mere presumption is evident from the fact that the late Irish team fought far better at Creedmoor than the united team, although the experience gained prior to the contest was far inferior to that attending the other. We hope that in future our Irish team, pure and simple, will maintain the reputation we have won in the matter of rifle shooting. We think this session of distinct nationality worse than a mistake—we regard it as a very ingenious absurdity. We do not wish to harbor suspicion unduly; but we believe that Ireland was allowed to participate so that the defeat might be borne the easier. Had success crowned the effort, very little would have been heard of Ireland; the praise would have been for the British team. If there is such a burning anxiety to be joined with us, let the Queen's prizes at Wimbledon be opened to Irishmen, and let our country be recognized as existent. When this is done, we may consider the wisdom of going to America under the English flag, taking our share in the loss, and being ignored in the victory.

The *Volunteer Service Gazette* contains some very interesting correspondence. Mr. Herbert P. Miller writes an excellent letter to the journal, from which we make the following extracts:

"It appears that during the last ten years but little, if any, improvement has been made in the manufacture of small arms. The result of this is, Mr. Rigby points out, the Americans have stepped in front of us, and are now monopolizing a branch of industry which once belonged to this country; so we now see British honor and 'British interests' affected at one and the same time. I do not mean to assert as a matter of fact, that the American rifles are more accurate than those used by the British team; but I do say that, under the circumstances, there is a fair presumption that they may be so. Whenever this match is shot, the contest is sure to be a very close one; and if the Americans have ever so slight an advantage in the way of rifles, it will be quite sufficient to turn the scale against us. Of course, it may turn out, on investigation, that our rifles are as accurate as the Americans'; but, at any rate, this should be clearly ascertained before another match takes place; we shall then, in the event of another failure, be able to put the saddle on the 'right horse,' and know where to look for a remedy. Mr. Rigby thinks my suggestion, that both teams should be armed with the same rifle, would be difficult to carry into practice; perhaps so, as regards the Americans, but with us the matter ought to be easy. Surely, the maker of the selected arm would be able to loan a few rifles for the purposes of this match. Again, *why do our team stick to the muzzle-loader? How can we possibly create much in the performance of an arm which, in a military sense, is as obsolete as night-watchmen and stage-coaches?* In the event of a victory but little attention will be given to the matter by 'foreign governments,' unless it is gained with a breech-loader. Match small-bore shooting will not receive much permanent encouragement unless it is shown that some practical good may follow. Wimbledon itself would soon dwindle away if there was no other object than the mere pleasure of shooting. May I offer the following suggestions for consideration."

[The italics are our own.] Another correspondent, a "Snider Man," writes:

"From all accounts I think it is clear that the days of the muzzle-loader are ended, and the Americans have solved the problem which our gunmakers have tried in vain to master. The extraordinary performance of Sergeant Gilder in making sixteen consecutive bull's-eyes at 1,000 yards, with a Sharp's breech-loader, the first and the last of the series of eighteen shots being centres to the left, is worthy of notice; and these, too, with a perfectly strange rifle. Does it not follow that all our small-bore men must provide themselves with breech-loaders? From what I have gathered from the newspapers, and the evidence of competent eye-witnesses, I believe that our team had not yet learned the very A B O of organization; but although this was the case, it must not be imagined that all teams of English shooting men fall equally in elementary knowledge."

All we have to say is, that we think that Mr. Miller and "A Snider Man" are in the right direction. No one can be more conscious than ourselves of the advantages of drill and the American supremacy in team shooting. Such *tout ensemble* may be thirty per cent. in the achievement of success, but the other seventy per cent. is in having the right kind of a gun. When "A Snider Man" writes "How can we possibly create much in the performance of an arm, which, in a military sense, is as obsolete as night-watchmen and stage-coaches," this rifleman has hit it exactly. We predict quite a revolution at Wimbledon before long.

GLLEN DRINK RIFLE RANGE.—At Pelhamville, on the 17th of the Wright medal will be shot for. On the 20th subscription, and other matches, including a prize rifle. Matches to commence at one o'clock.

WOLVES IN THE OTTAWA VALLEY.—Writing from the Wakefield Mountains under date of October 15, Mr. Venner says: "Wolves are at present abundant on the rocky hills and mountains of Templeton and Wakefield. Some thirty sheep have been killed within the past few days in the neighborhood of our quarters. In Portland Township and along the Priest's Creek hardly a night passes without the howl of the wolf being heard, and here also the sheep have been killed in large numbers. Mr. Pelissier, of Wakefield, informs me that two years ago an army of wolves came down along the valley of the creek just referred to, and destroyed everything in their track. Some two hundred sheep fell victims to these blood-thirsty creatures in Portland alone within a comparatively few days. In the Gore of Templeton these animals are just now particularly abundant, and this locality is barely fifteen miles from the East Templeton wharf on the Ottawa River,

## Game Bag and Gun.

### GAME IN SEASON IN NOVEMBER.

Moss Alesse, *maclitis*.  
Elk or wapiti, *Cervus canadensis*.  
Hares, brown and gray.  
Wild turkey, *Meleagris gallopavo*.  
Woodcock, *Philohela minor*.  
Ruffed grouse, *Bonasa umbellus*.  
Plover, *Charadrius*.  
Godwit.  
Rails, *Rallus virginianus*.  
Snipe and Bay Birds.  
Caribou, *Tarandus rangifer*.

Red Deer, *Caracus virginianus*.  
Squirrels, red, black and gray.  
Quail, *Opiz virginianus*.  
Pinnated Grouse, *Cupido Cupidonia*.  
Curlew, *Numenius arcticus*.  
Sandpipers, *Tringa*.  
Willetts.  
Reed or Rice Birds, *Dolichonyx orizivorus*.  
Wild Duck.

"Bay Birds" generally, including various species of plover, and piper, snipe, curlew, oyster-catcher, surf birds, phalaropes, avocets etc., coming under the group *Limacole* or Shore Birds.

MASSACHUSETTS.—*Thunton*, Nov. 9.—The birds in this neighborhood have been less scarce this fall than usual, but very wild. The woodcock frequent the dense swampy thickets of which there are so many about here. The oldest hunters and best shots complain that, unlike good little children, they are heard, but not seen. I saw, however, the other day a fine lot of birds which fell to the gun of a man who has had experience in every State from here to California, five plump woodcock and six ruffed grouse, fat and tender. Very few quail have been shot. The ducks are beginning to fly over the Middleboro ponds. A party of three got two canvas backs, fifteen black ducks, twelve coots and one wild goose in eighteen hours, and the season may be fairly said to have begun. There has been some good fishing during the summer in the ponds about here. I got nineteen black bass one day, all over a half-pound and under two pounds. A small boy of eight years, with a stick, a little twine and an hook and a worm, "playing catch bass" along the shore of Assawamset Pond, is high hook with a five-pounder. Strings of 200 and 100 odd white perch in a few hours have been caught. H. D. J.

Wareham, Nov. 10.—Quail and partridges are unusually plenty hereabouts.

CONNECTICUT.—*New Haven*, Nov. 8.—A party of well-known business men, among whom were F. A. Gilbert, E. S. Kimberly, Charles Kimberly, Frank H. Hooker, H. S. Holcomb, George E. Spare and two or three gentlemen friends from New York, returned yesterday from a hunting excursion to Colchester. They brought back a dozen partridges, eighteen gray squirrels, twelve red squirrels, a fine lot of quail and three gray coons. A party of students shot a deer at Lake Saltentail the other day. Possibly the animal had escaped from some collection, as deer are now rare visitors in this neighborhood.

Hartford, Nov. 9.—The Hartford Fox Club, consisting of Dr. David Cray, David Clark, J. G. Lane, E. C. Kellogg, Martin Bissel and George Downing, with their dogs, visited Talcott Mountain Monday morning, and before they returned, Dr. Cray had the good fortune to send a charge from his Parker gun into a fine fox, which was bagged and brought to town as a trophy.

RHODE ISLAND.—*Newport*, Nov. 7.—There are plenty of coots lying in our bay, and the shooting is good over at the Dumpings. Castle Hill, Dyer Island and Hope Isle are fine places for black ducks. No end of black ducks have been shot there. Some sport has been had shooting teal. Some snipe and yellow leg shooting has been had here, but think it is about over for the season.

NEW YORK.—*Bloomburgh*, Nov. 10.—The shooting good. Had fine sport this week. Mr. Werzel, Mr. Junk of Hoboken and myself making a fine bag in two and one-half days' shooting; nine partridges, nineteen rabbits, ten quail and eleven woodcock. Woodcock are becoming scarce now; partridges plenty. MILO.

Cayuga, Nov. 9.—The ducks are scarce just at present, but cold weather is expected to bring great flocks of them to the lakes. The game constables are rigidly enforcing the law, and the batteries have been effectually banished.

Glens Falls, Nov. 11.—Mr. A. B. Abbott, one of the managers of the Hallock Sportsmen's Association, was on Tuesday last elected Member of Assembly from Warren County, "by a large majority." A hundred or more geese passed over yesterday, bound South. Ruffed grouse have not been as plenty as usual this fall, owing to the forest fires at nesting time last spring. GLEN FALLS.

NEW JERSEY.—*Kinsey's Ashley House, Barnegat Inlet*, Nov. 6.—The shooting up to date has been fair. Black ducks very plenty; sprig-tails, until last few days, ditto; sheldrakes never more plentiful; broadbills are making their appearance in large numbers, and 80 per cent. young birds. The young growth of mussels in the channel affords them excellent food, and will afford us some fine shooting this fall, as every day increases the number. Your correspondent bagged 20 Saturday.

Very few geese yet, and I have only noticed some half dozen bunches of brant. This looks fashionable, as the old gunners say they are holding back for their young ones. We always notice the later the brant are the larger proportion of young birds, and consequently better shooting. B.

PENNSYLVANIA.—*Dunn's*, Nov. 6.—Two men here last week killed 21 ruffed grouse, 6 pigeons, 3 rabbits, 1 duck. Game is moderately plenty for this part of the country. P.

Centre.—Mr. Sam. Weis, of Centre township, according to the *Sunbury Gazette*, brought down three wild turkeys, and wounded a fourth, at one shot.

Greenville, Nov. 10.—Capt. Nelson, E. Christie O. Luke and A. Bright and myself have just returned from a three-weeks' duck and chicken hunt in Western Ohio and Indiana, Huntsville, Ohio, and Syracuse, Indiana. Nelson and Luke shot four wild turkeys. Ruffed grouse are quite plenty in this section. A fine bag was brought in to-day by three of the club.

—The *Wayne Democratic Press* says: "The number of woodcock and partridge that have been shot by our sportsmen this fall exceeds that of any other year within a space of five years."

VA.—*Bellefonte, Nottawac Co.*—Our correspondent, Capt. John M. Taylor, writes us that he is off for a hunt, and has taken with him his setters, retrievers and foxhounds, so as to combine all the pleasures of the chase. Now, if quail, duck or deer come in Captain Taylor's way, he will be fully prepared.

TENNESSEE.—*Nashville*, Nov. 10.—Ducks are abundant above the reservoir and at Shelby's Pond.

LOUISIANA.—*New Orleans*, Nov. 6.—The *Times* devotes a column to the field sports about the city. We learn that no time has yet been fixed for the proposed hunting match between the New Orleans and Montgomery gun clubs. The hunt is to be confined to the marshes, bayous, lagoons and lakes for some ten miles around Lake Catharine, and limiting the varieties of game to be killed to the snipes, geese, brant, rails and the twenty odd varieties of ducks that are found in that region. It will, in short, chiefly be a grand match duck hunt.

Game is still scarce. The southward flight of ducks has been unusually backward this year. Game at this season was never before so scarce. This is an indication of a mild winter at the north. Crack wing shots, who are usually good for thirty to sixty ducks in a day at Lake Catharine find it difficult to bag half a dozen. The cold weather of the last few days, however, is bringing the flocks in, and shortly the shooting will doubtless be quite good. A great many snipe, in excellent condition, have recently been killed within the city limits, on the upper side of the new canal beyond the white bridge. Most of the ducks in the market come from Labranche, up the Jackson railroad. Quail and woodcock from the highlands of Tagilape are scarce and high. Large rabbits from the Mississippi swamps, and small ones from the pine woods, are plentiful, as are also the delicious ground doves from across the lake. Reports from the Attakapas country represent game in that paradise for sportsmen as plentiful. Great bags of woodcock, snipe and ducks are being made, especially in Vermilion. There is good snipe shooting at Kennerly. Labranche is a noted place for ducks, particularly the plump French or mallard. Frenete is good for snipe and ducks as well as squirrels, while Maubach is a favorite resort for deer, interspersed and seasoned with adventure by an occasional wild cat, and, at rare intervals, black bear.

MICHIGAN.—*Belleve*, Nov. 4.—Shot three woodcock yesterday, all plump and fat. Very late for the birds. We are to have a game protective club here soon.

KANSAS.—*Rosedale*, Nov. 7.—Quail plenty; pinnated grouse, woodcock and ducks scarce. T. D. J.

MINN.—*Ashland*.—Deer shooting is excellent this fall. C.

CALIFORNIA.—Brannan Island and the lower half of Andrus Island are fairly overrun with ducks and geese, and sportsmen can not desire any better sport than can be there obtained.

San Francisco, Nov. 4.—Ducks are reported plenty in the San Joaquin Valley, and at other places in the interior, but are rather thinly scattered on the bays and marshes yet. In two weeks more they will probably be plenty at Alameda, Sausalito and San Bruno. D. S. L.

—They are doing a great deal of moonlight duck shooting in California. There can be no better plan to entirely exterminate the ducks. Some day their moonlight duck shooting will be all moonshine.

BLUE ROCKS OFF THE COAST OF IRELAND.—We have the following interesting facts from the well known pigeon shooter, Ira Paine, Esq.:

Perhaps it may interest some of your readers to know about shooting the true and original blue-rock as found in its wild state. Of course we all know that the blue rock is the swiftest of the pigeon family. But there is the greatest difference between the blue rock as it is bred in a domestic condition, and the wild one. The wild bird is rather bigger, has greater stretch of wings, and consequently a more rapid flight. The prepared skins of two wild blue rocks I sent to your office last week, will also show you some other slight differences. Off Queenstown, from ten to twenty miles, are cliffs rising up from the water side some fifty to two hundred feet. These cliffs are high and perpendicular. Just above high water, or where the surf might strike, there are clefts or crevices, small caves as it were, due to the decomposition of the stone. Just here is where the blue rocks breed. I took a boat, manned by four good oarsmen. The shooting is only possible when the wind is off shore; when it blows on, the risk of being swamped precludes all sport. You have to shoot from the boat, and approach these places where you can see two or three pigeons, then you strike the guwale of boat with a stick, and away sky-rocket the birds. It won't do for me to say what kind of a shot I am, modesty would prevent that, but what with the teetering of the boat, and the lightning-like rapidity of the birds, it was as nice shooting as I ever saw. The speed of the birds was terrific. My companion was Mr. E. Hodder, the son of Dr. Hodder, of Toronto. We killed together some thirty-six birds. Mr. Hodder has killed as many as sixty on a favorable day. Save shooting birds over dogs, shooting blue rocks is the finest sport I know of.

—In reply to a correspondent who wrote to us complaining that he could not obtain the \$17 gun, advertised in our columns by Hyde, Shattuck & Co., that firm writes that they are now making only the twist barrel gun, price \$20.

—The editor of the *Virginia City Chronicle* is a noted Nimrod. On arriving at his favorite field, one day last week, and finding that some one had mischievously cut the mouth of the bag of live birds stored with his usual foresight under the buggy seat, he rushed back to his sanctum and penned and printed the following sarcastic item: "Live quail are being shipped to this point in considerable numbers. They are a necessity to every hunter's complete equipment."

TIT FOR TAT.—A farmer in Chester County, Pa., prosecuted three hunters for trespassing on his premises, for which they were fined. They retaliated on him by telling him they would give him three days' time to remove all the noxious weeds from off his farm, and, in case he did not, they would institute suit against him for a violation of a special law for Chester county, which is punishable with a fine of \$50. The farmer, taking the hint, has four men busily engaged in cutting and pulling weeds.

AN OLD PISTOL.—Mr. Otis Fellows, of Hornellsville, N. Y., has an old rifle, captured during Napoleon's campaign before Berlin. It is 33 inches long, the length of the barrel being but 18 inches. It is heavily made, and weighs 8 pounds. It carries a two-ounce ball. There is also a pistol made by the celebrated gunsmith, "I. Patrick, Liverpool, maker to the Duke of Gloucester." It is said that it has been carried by the Duke and by Aaron Burr. He also has a powder horn which was carried in the French and Indian war, and in the Revolution.

This is from our most charming contemporary *La Chasse Illustrée*, of Paris, France: "One day last week, a rich merchant of Paris went out to Martz intent on sport. A quail popped off almost between his legs, as 'did the gun in his hands. The quail cleared a hedge, apparently in no ways disturbed, save, perhaps, having lost a feather or so.

The sportsman eagerly got over the hedge, hoping to stoop down and pick up a dead bird.

There was not as much as the shadow of a bird. A countryman was near.

"I say, my friend, did you hear a quail fall anywhere about here?"

"Not the least bit of quail in the world."

"That is strange—I could swear I saw the feathers fly!"

"I saw it, too—a feather or so, but those feathers flew away on the liveliest bird I ever saw."

**A MISFORTUNE.**—*New York, Oct. 29.*—DEAR FOREST AND STREAM: The many friends of that prince of good hearted sportsmen and crack shots, Fred Goodhue, will deeply sympathize with him in his sad affliction, having lost the sight of his right eye. Dr. Agnew, of New York, under whose care he has been for the past month, hopes to be able to restore the sight of the eye again. May the doctor's hopes be granted is the wish of one who has known Fred for years, and a more generous, whole-souled man never lived, always having a kind word for every one, and ever ready to help a friend in need.

Yours sincerely, J. B. A.

**GLASS BALL SHOOTING.**—That remarkable shot, Mr. Ira A. Paine, commenced an engagement at Tony Pastor's new theatre on Monday last. To the sound of low music, there is the accompaniment of the quick discharge of the breech-loader—in fact, a kind of running bass. Mr. Paine breaks the balls with the greatest ease, concluding by hitting two balls, sent from the traps at the same time, with his right and left barrels. We should suppose that in the theatre breaking glass balls would be more difficult than in the field; firstly, because the lights are not good, and secondly, the flight of the ball is restricted. All the shots have to be very quick ones. Those unacquainted with glass ball shooting would do well to witness Mr. Paine's performance.

## SHOOTING AROUND MONTAUK.

SHELTER ISLAND, L. I., Oct. 21, 1877.

Dear Hallock—A gloomy northeast storm is to-day sweeping over the hills and valleys of Shelter Island, and the scowl of the sky and the tapping of the rain against the window panes, while they admonish us to seek the sheltering roof, at the same time invite us to ponder over the sporting success or failure of the few past months. The woodcock shooting on the eastern part of Long Island has been rather a failure, owing, perhaps, not so much to the scarcity of the birds as to the copious rains of May, June and July, which scattered the flocks over a wide space of woodland and upland, and left but few in the swamps of the brooks, where in collected numbers they are most sought and found. The Hampton gunners were out in numbers on the opening, 3d of July, but, so far as we personally know, the birds were scarce, the bags light, and the success much less than in former years.

We have just returned from a two-months' visit to once-famous Montauk, so celebrated for its bird, duck and geese shooting, and once so eagerly frequented by sportsmen who could find their way to that remote locality. Such men as Mr. Roosevelt, Frank Forester, and others of sporting fame who used to rejoice in their ancient successes, would have been sadly disappointed in this year's sport after the birds, nor would they now have enjoyed their usual triumphs against the duck and geese could they be present in the coming November and December. The glory of Montauk, with its sunny plains, its grassy slopes, its salt meadows, once swarming with the plover and bay-snipe, has departed, and the wild geese no longer gather around the Great Pond, Port Pond and Fresh Pond in clamoring battalions as of yore. The old stumps of trees and the hollows dug out by the shore, where they laid in ambush to thin out the flocks winnowing their way from place to place, from feeding-ground to landing-place, are still there, but the noble game are absent. Great Pond, their once favorite haunt, with its wild expanse of nearly 400 acres of water, has been drained off by the eelers, and the salt tides having been admitted have destroyed the fresh-water grasses, the choice and natural food of the duck and geese. A few years since they collected there in spring and autumn in immense numbers, making splendid shooting over all that part of eastern Long Island, and around the ponds and bays of the neighboring Gardiner's Island, but such is the case no longer. In those days the plover, the snipe, the greenbacks, the blackbreasts, gray plover, the yellow-shank, brant bird, dowitcher, robin-snipe and others, were found in countless flocks from the marshes at the head of Napeague Bay on the west, to Gin Beach and Great Pond on the east; but during the past season, from July to October, we found but very few of them in their old places of resort. They must all have taken some other route in their annual migration. It is true that the grasshoppers, the plover's natural food, were very scarce this year over the plains, which may partly account for the scarcity of plover; but the salt marshes and pond holes were there as ever before, but the snipe were not feeding or flying over them as in years past. We patrolled the plains and the marshes this year on frequent occasions, but the expected flocks never darkened the air or uttered their shrill whistle though we arranged our set of bird stools in our most artistic manner, and awaited impatiently for their approach. Let us hope that the next year, and many more of them, will be more favorable to the sport with the birds, and that the Great Pond may be enabled to shut out the in-flooding bay tide; that the succulent fresh grasses may again take root and flourish, and that the myriad of wild geese and duck may re-visit their ancient haunts, there to enjoy their favorite food, and that the fowler's gun may be again heard by the waters.

Montauk, as you probably know, is a long, narrow region of hill and valley, interspersed with woods, extending from the little village of Amagansett to Montauk Point, a distance of twenty miles. The light-house is stationed on the extreme easterly point, and there are but three other dwelling-houses throughout all that distance. These are the comfortable homes of Messrs. Stratton, Conkling and Osborne, who will hospitably accommodate the fowler or fisher. These men cultivate many acres of land, and have the general supervision of the great herds of cattle, sheep and horses, which range over those miles of pasturage. A part of these herds are driven by horsemen, on the 10th of October, from the summer-grazing places on the east as far west as Easthampton, where their several owners come to claim and drive them homeward. The balance of the herds are collected and driven home on about the middle of November.

But a small remnant of the once powerful tribe of the Montauks still

survive in their ancient possessions. They are dwindling away, year by year, and must be soon extinct. They are allowed by the trustees to occupy, fence and cultivate as much land as they select; but the Indian is not fond of labor, and seldom vexes the land or himself with the work of the plow.

The whole Peconic and Gardiner's bay shore, from Shelter Island to Montauk, an extent of twenty miles, is lined with the stakes and seines of the pound-fishermen, and those wide bays are whitened with the sails of the bunker fishers. There are several fish factories along the shore where the oil of the fish is pressed out, and the "scraps" prepared for manure. Two large factories of that sort are located in Napeague Bay, and employ many laborers and fishing vessels. They have been unusually successful this season, but the fish have been of poor quality.

The wild fowl, such as the varieties of coot, old squaws, sheldrake, etc., are collecting in numbers now in Peconic and Gardiner's bay, and around the shores of Shelter Island. Our friend, Capt. Ben. Cartwright, a few days since, killed thirty of them in a short time, and if you, dear Hallock, and myself had been in the boat with him, I think we should have enjoyed better sport than we had on that sharp November day when we laid in ambush together for deer in the noble woods of Blooming Grove Park. Pleasant is the remembrance of that period we passed together, in company with Giles, Scott, Whitehead and other congenial spirits, famous with the pen, the gun and the rod.

We learn that the ducks are beginning to collect in great numbers in Shinnecock Bay, and soon the broad-bills and brant and geese will afford good sport to all who seek for them, in company with Will Lane, the Pennys and the Posters. Success to their breech-loaders.

I have not yet sought to find a publisher for that volume of poems on sporting topics which I have prepared for the press, and concerning which I asked your good advice a year or two since. Possibly, when times improve, you and I may find some one willing to usher it into the world. Very truly yours, ISAAC McLELLAN.

"MONTAUK."

## SPORT IN IOWA.

EDITOR FOREST AND STREAM:

I have often longed to spend an Autumn on the prairie, where I could shoot the pinnated grouse, the sand-hill crane; and to know something of the habits of the latter. In my boyhood days I have lain for hours at a time, on some bright September day, and watched them as they circled slowly around, high in air above the reach of gunners' hopes, and then sail away on their annual southern flight, till lost in the blue of the sky.

I have done considerable hunting since then, but not until the present season have I been lucky enough to shoot a sand-hill crane. They are so vigilant that it is almost impossible for a hunter to approach near enough to shoot one while they are feeding, unless they alight near a corn field. First one will rise from the ground to the height of a rod or so, and take a view to see if an enemy is approaching, and after alighting a few minutes, another of the flock will do the same; and thus they do all the time while feeding, unless they are on some knoll, or high ground, where they may see all around them.

I had the good luck to shoot two from a corn field; also, a white one, which are still larger than the sand-hill. It was snow white, with the exception of the wings from the first joint on, which were black. I should like to know whether they are counted a game bird, and if any of the States have laws to protect them or not. The farmers here think them as good as roast turkey, and I wouldn't pass them by when served the same way.

This is a good place for game for about three months—from the 15th of August (when the law permits the killing of grouse) till the middle of November. The prairie is covered with ponds or lakes, and from the first of September until they freeze up, may be found most all kinds of snipe and water fowl in and around them.

Most of the smaller ponds are grown up with reeds and rushes around the margin, so that you cannot detect them until close upon them, but you may know where they are by the large number of hawks, which are always sailing over their surface, in search of a wounded duck or snipe, and at times, the musk rat falls a prey to their sharp talons. Deer are quite plenty yet, but will soon be driven away by the hounds the hunters are bringing in. I saw one party of hunters a few days ago, with ten deer that they had killed by the aid of their hounds.

Many of the farmers make a business of trapping musk-rats in the winter, as the ponds and most of the streams are full of them. There is a law here that prevents the killing of them until the first of November.

The ice broke up on Cedar Creek in February this year, and a trapper, in floating down a few miles on it in a boat, shot sixty musk-rats, for which he received a shilling apiece for their pelts. If there's anything in the sign of the muskrat building large houses expecting a severe winter, I think the coming one will be so, as I never saw them build larger ones than they are doing this fall.

I hope to shoot game the coming winter on St. Mary's Lake, in the southeastern part of Missouri, where I spent the winters of '71 and '72 and by the light of the camp-fire, read FOREST AND STREAM.

SANDPIPER.

Cedar Creek, Calkins Co., Iowa, Oct., 30, 1877.

[Sand-hill cranes are excellent eating, and considered rare game birds. They are not protected by law. They seem to be able to take care of themselves.—Ed.]

## SPORT IN MEXICO.

EDITOR FOREST AND STREAM:

Under this heading one must not understand bull-fighting, cow-tailing, cock-fighting, or other sports of like nature, in which the natives of the Spanish-Americas generally indulge; but our own healthful and exciting sport with the gun, which after comparison with what amateurs enjoy here, I cannot but say redounds greatly in favor of the former.

On the Northern frontier, bordering on the Rio Grande River, game abounds from the months of October up to March, comprising geese, deer, turkey, duck of all kinds, jack snipe, quail, papabote (a kind of plover) and the "chachalaja," of which bird I will give a slight description.

It is essentially peculiar to Mexico, and only found in thickly wooded parts of the country and also on banks of rivers. It is the nearest approach of any wild fowl to our domestic "cock and hen," about the size of a spring chicken, with a longish tail, and of a dirty brown color. It derives the name from its call or cackle, resembling much that of a wild parrot, and which can be heard at nearly the distance of half a mile. It is prized as game chiefly for its unsurpassed flavor for the table. Its flight is slow, and to get after his game one has to beat his way through the "monte," or jungle, and then, with rare exceptions, be satisfied with a "pot shot" from off the trees. One is generally satisfied with having had a reasonable day's sport after bagging from ten to twelve brace of snipe, quail, canvas-backs, mallard, teal, etc., with as many quail, snipe, plover, and occasionally a brace or two of wild geese, and that without necessity of having covered much ground.

Duck are generally found in the "resacas," or small ponds, where water collects from the September equinoctials, but as the feeding is

poor they deteriorate in flavor by about January. Jack-anipe and quail also are very plentiful, the former especially in swampy places, though I have met with them in plowed fields. Sometimes about mid-day, when the sun comes out hot after a cool morning, one is promised such sport as generally to cause a postponement of lunch.

If there were more facilities attending the transit to the country and safety in going about and camping out, many of our sportsmen from New Orleans and other large cities of the South would undoubtedly avail themselves of such sport where no game laws exist, nor license nor trespass observed; and where, as I have frequently seen, if a covey of quality too far one leaves them and proceeds in search of another.

Matamoros, Oct. 1, 1877.

PEDRO.

## MY FIRST SWAN.

EDITOR FOREST AND STREAM:

The winter of '77 and '78 was a cold one, and we had anxiously looked for spring and the birds. Where—Oh I've forgotten; we were on the then frontier in Northern Iowa where to-day is located one of the liveliest towns in that section. The winter had been tedious indeed, and spring had come at last, the Red Cedar, with full banks and strong current was the resting-place of thousands of weary wings which were beating their way toward the lakes and marshes of Northern Minnesota. The sloughs on the prairie, so honest John Butler said, were "jest live with duck and geese, you bet."

Charlie and I needed no second invitation to accompany him on an expedition to a certain slough that he had in mind. John was a Rocket River man, schooled in the woods and on the lakes and streams that have since become the haunts of the angler and his brother of the gun. He was an unerring shot with the rifle, and a better woodsman I never met. Peace to his ashes—he rests in a soldier's grave. The place John was to take us to was six or eight miles from the settlement. It was a little past noon when we heard John's whip crack merrily as he approached the store with his ox team, for he said we could "jest git rite onto 'em with the cattle." I had hunted on horseback and had hunted chickens in a wagon, but not till then had I hunted with oxen. The road was across the prairie, and we had to pursue a devious course to avoid sloughs; so it was nearly four o'clock before we were in sight of the promised land, or rather water. We at length reached the crest of the Prairie from where it rolled gently down to acres of flooded land connected here and there by narrow necks, and stretching off to the south for miles covered literally with water fowl, ducks and geese, and in fact everything that could quack or gabble.

After resting we concluded to take a pond some hundred yards wide and as many more in length, for our point of attack. John drove the team so as to skirt the shore of the pond, while Charlie and I walked beside the wheels on the off-side. As we approached, the flock looked up inquiringly, but did not seem to be alarmed; and John was right, for here we were "rite onto 'em." It was a right royal sight. I had noticed one bird larger than the rest, that rested quietly on the surface of the pond apparently undisturbed by the clamor around it. As we came still nearer John whispered, "its a swan; its pelt's with ten shillin'!" I had a rifle, and as true a piece of metal as you could wish, and I was a little proud of my ability to handle it—John had been my teacher.

I had never seen a swan so near before. John wanted its pelt, and I was under the eye of my master. John stopped the cattle about ten rods from the magnificent bird, which momentarily grew bigger and bigger to my vision. Ducks were plenty; geese were thick; but I saw nothing but that swan. "Fire!" says John, "or he'll git scak." I drew the rifle with which I could shoot off the head of a chicken or partridge at half the distance, to my shoulder, and rested over the wheel and fired. I distinctly saw the bullet strike the water at least ten feet from the swan (John said "ten rods," but I never believed that). A rush of wings, a discordant noise, the report of Charlie's gun as he brought down two out of as many hundred geese, a sharp crack from John's whip, and an ejaculation from John for force of language and absence of compliments was a gem in its way, and my eyes lost sight of the swan, from which they had never been removed after he took his flight, and rested on the disgruntled countenance of John. My looks must have touched him, for he never afterward referred to that swan—Charlie does, however.

Reader, have you shot (at) your first deer? Then I need not appeal to your sympathies in vain; for the first swan resembles the first deer in this particular—you seldom hit it.

MUS-QUA-QUA.

## HOW TO CLEAN A GUN BARREL.

EDITOR FOREST AND STREAM: My chief incentives are to express my approval of such communications as that of "Edisto's," in your issue of Oct. 18, and to ask him what kind of cheap powder he finds satisfactory. Will he be so good as to tell me? Years ago I used to find the Hazard Kentucky Rifle powder good enough every way. It was cheap, and at the same time clean and strong. But finally I could not obtain it good and was compelled to try other makes with no better success. I believe that any of the leading manufacturers can make a good article of powder when they wish to; but I do not think that generally they regard it to their interest to make a good, cheap article, though their profits on the higher grades must be extremely large. No false notions of property or of self-interest ought to prevent sportsmen from knowing who makes the best powder. As I have had some experience with dirty powder I will tell your readers how in a great measure to obviate its defects. The plan may be new to some of them at least, and could, no doubt, be employed to advantage with the better grades of powder, as well. In using a muzzle-loader, when the gun begins to load dry and rough, charge your barrels with powder, carefully wadding with one or two wads, to prevent the water from reaching the powder, then pour in, and quickly turn out enough water to thoroughly wet the inside of the barrels; now fire off the charges of powder and the gun is ready to reload for use. But as being more convenient, and, so far as I can see, practically just as good, I have generally loaded with both powder and shot, putting the water in on top of this, turning it out quickly, and going on my way ready for a shot. But in this case care should be taken to carry the muzzle downward until there is an opportunity to shoot; as sufficient water might remain in the barrel to reach the powder if carried otherwise. By repeating this process as often as may be necessary it is wonderful how long a gun may be used without cleaning. So far as the shooting qualities of the gun are concerned I find them much improved by this means. No doubt it would be of equal advantage in breech-loaders, and could be applied to them with much greater facility.

SPLASHER.

## RECOIL THEORIES.

Of explanations of recoil there is seemingly no end. Many of these, which appear positive demonstrations in the eyes of the authors, are really but crude guesses at what might be the truth of the matter, and we drop them aside. It would be interesting and satisfactory to have a solution of the problem, but it must be wrought out through more exact methods and more scientific modes than many of our correspondents employ. A Toronto reader says:

Any recoil that can take place must be at the delivery of the shot.

This is the second time that Madison has won the Club

These are properly all the flies necessary for an angler's repertoire, though there are choice patterns highly prized by experts which will not be found in the stock of the tackle shops. We are very glad to be able to speak of these flies of Mr. Hally as very carefully and conscientiously prepared productions. Probably we have never possessed better. We know that any gentlemen ordering from him will receive full satisfaction. We always order our flies made in winter. The manufacturer has more leisure then, and can do his patterns better justice. In the spring every one applies at once, and are not as liable to be so well served.

**ANOTHER BEAUTIFUL ROD.**—Verily, we are favored among sportsmen! Mr. Chas. F. Orvis, of Manchester, Vt., whose reputation as the maker of fine trout and bass rods has grown deservedly wide within the past three years, has kindly presented us with one of his finest trout rods. It is made of lancewood throughout, silver mounted, with metal reel seat, and whipped with silk throughout like split bamboo rods. These silk windings prevent the rod from breaking, and add much to its beauty. In some respects the rod before us is a novelty. It is a "combination" rod, but it is the only combination that we ever took kindly to. The first joint is about sixteen inches in length. This includes only that portion which is held in the hand, commonly designated as the bulge. Behind the bulge and near the extremity of the bit is the reel-plate, which holds the reel. Into the ferrule of this joint can be fitted at option either one of two sets of joints, making a complete rod, either for trout or bass fishing. In other words the angler is provided with two separate and distinct rods, with a handle common to both. Thus the uniform elasticity and play of each is preserved throughout; whereas in the old-fashioned combination the quality of one or all must be impaired. We understand that Mr. Orvis can manufacture rods of this kind to order for the low price of \$15, and we can most readily recommend them to the attention of any who find economy in expenditure to be a consideration, or who prefer wood to bamboo. For this gift so generously bestowed, the donor has our sincere thanks. It shall be put to no ignoble service.

**ORVIS'S SHOW CASE FOR FLY PATTERNS.**—We are gradually collecting at our office quite a museum of sporting materials. Sometime ago we were presented by the Hazard Powder Company with a magnificent mahogany case displaying the several kinds of powder manufactured by them, and more recently a similar case with the sizes of shot made by Tatham Bros. These are of great service to sportsmen selecting their ammunition for various kinds of game and calibres of gun. Of like service is a beautiful case presented to us last week by Mr. Charles F. Orvis, of Manchester, Vermont, displaying the several varieties of trout and bass flies made by him for the use of anglers. The name of each pattern is attached to it, so that the puzzling nomenclature of the profession is at once made intelligible to the tyro, and he has only to make his selection and send in his order according to the patterns desired, merely giving the name of such and size he may want. We think if all dealers would adopt the plan of hanging a similar show case in their shops they would not only facilitate the transaction of business and satisfy the purchaser, but largely increase their sales. Mr. Orvis' flies are very carefully tried, while the materials are selected with scrupulous care. That buyers are pleased with his work is shown by the fact that he is constantly filling orders from every State in the Union, however remote.

**A FISH SHOWER IN CANADA.**—The story runs somewhat as follows, and it all happened to a school-marm in Harwick Township: Having dismissed her school, she was walking to her boarding-house on or about the 8th of this month, when in the grass [Query—Is there grass in or around this part of the Dominion in November?] the lady came across another school of fish, this time in a pasture. Having been "brought up at the sea shore," where she first undoubtedly saw a fish, she took them to be rattlesnakes; then her marine ichthyological knowledge being of great use to her, she instantly knew the fish to be a kind of pickerel. [Query—Does the *esoc* frequent the sea shore?] Anyhow, after a few screams, being a thrifty young woman, she came to, and having gone back to a pail in the school-room, she collected a bucket-full of fish. "The circumstance," writes a paragraphist to the *Toronto Globe*, "is unique, apart from its strange surroundings." Now had the fish been smoked herrings or desiccated cod, the whole matter would have become quite plain; but a fish shower of pickerel in Canada, it must be confessed is puzzling. Perhaps the Provinces are jealous of the richness of the States. Since we have had a sausage storm in and around Cincinnati and a hash hurricane in Illinois, why should they not have a pickerel avalanche in Harwick Township?

**CURIOUS CAPTURE OF A SEAL.**—One Thomas Morris, while standing upon the high cliffs of Ramsey Island, Great Britain, perceived a seal asleep on the shore below. Descending, he succeeded in getting between the animal and the water before it awoke. As it made for the beach, he seized it with his hands, and after a long and severe struggle succeeded in tying a handkerchief around its flippers. It proved a very troublesome pet, snapping at every one who approached it, but curiously enough is far more incensed at the sight of its captor than any other person. The cliff where Morris descended seems almost impracticable, and how the man got down, and still more how he got up, carrying a struggling and snapping seal is a mystery.

**COD FISHING IN ICELAND.**—*Chambers Journal* gives an interesting account of the French fisheries for cod in Iceland:

The fishermen, it seems, are sometimes rather impressed than serve as volunteers. Most of the men come from Brittany. The duties when fishing are very heavy, and the accommodations for the men miserable.

In a cod fishing craft it is necessary to have as many men as possible, and twenty are usually taken. The arrangements are woefully insufficient. There are only sleeping-places for a third; one sailor resting while two are fishing. Thus, after six hours spent on deck without shelter from rain, wind and snow, the waves washing over and the heavy line in their hands, the men go down stiff with cold and worn out with fatigue. Yet they must lie, dressed as they are, on a hard, damp mattress; and frequently the clothes are never changed from the beginning to the end of the voyage. After five voyages a man is authorized to take the command, and though styled captain, he is nothing more than the head of the fishermen. It is his work to keep the account of the number of cod caught; the sailors taking care, as they hook a fish, to cut out its tongue and place it in a bag hung to their belt. When the hour of repose comes the tongues are taken to the captain, and about ten centimes is allowed for each. The second in office is only chosen as being the most skillful with his line; then comes the man who cuts off the cods' heads, opens and prepares the fish for the salter; and lastly the one who lays them in the barrels and closes them for sale. Those ships that have chosen their position for fishing take down their sails and lie as quietly at anchor as the wind will permit, the men standing in a close line at the side of the vessel. They are clothed from head to foot in knitted or flannel garments, with waterproof capes and hats. A petticoat of strong linen is tied around the waist, descending below the knees, and to preserve the feet from wet they wear woolen stockings and waterproof boots. Thick woolen gloves, lined with leather, save their hands from the injury of constant friction from the heavy line. The whole forms a curious picture of ragged, patched, greasy, well-tarred habiliments, which a comic pencil might rejoice to portray. The men, indifferent to their appearance, seek only to be saved from moisture. The lines they use are necessarily very heavy to bring on board a fish weighing, say forty pounds. There are two hooks baited with the entrails of fish; but the voracity of the cod is such that it is scarcely necessary to be too particular as to the lure. Thus the men stand for six hours consecutively, gently moving the line, and when a shake indicates a catch, lifting the heavy weight on board. The fatigue is very great, and much of it is pure loss, as the line too often brings up another fish, called the *fletan*, which, though very good to eat does not bear preserving. The sailors look this interloper in extreme aversion, as it often breaks the line by its weight, and gives them much trouble to heave on board.

**THE USE OF PIGEONS IN THE FISHERY BUSINESS.**—We have already spoken of the employment of carrier pigeons in the fishing industry. From the *Fishing Gazette* we take the following:

The experiment which was tried last year of employing carrier-pigeons for the purpose of bringing early intelligence each morning from the fishing-ground of the result of the night's labor, is again being resorted to this season, and with the most satisfactory results. One of the birds is taken out in each boat in the afternoon, and after the nets have been hauled on the following morning and the extent of the catch ascertained, the pigeon is despatched with a small piece of parchment tied round its neck, containing information as to the number of crabs on board, the position of the boat, the direction of the wind, and the prospects of the return journey, etc. If there is not wind to take the boat back, or if it is blowing in an unfavorable direction, a request is made for a tug, and from the particulars given as to the bearings of the craft, she can be picked up easily by the steamer. The other advantages of the system are that, when the curers are apprised of the quantity of herrings they may expect, they can make preparations for expediting the delivering and curing of the fish. Most of the pigeons belong to Messrs. Moir & Son, Aberdeen. When let off from the boats, the birds invariably circle three times round overhead, and then sweep away toward the land with great rapidity, generally flying at the rate of about a mile per minute. Two superior birds in Messrs. Moir's possession have occasionally come a distance of twenty or twenty-five miles in as many minutes; and on Tuesday one of these pigeons came home sixteen miles in the same number of minutes. Another of Messrs. Moir's pigeons flew on board the *Heatherbell* on Tuesday afternoon off the Girdleness, bearing a slip of paper containing the intelligence that the boat from which it had been despatched at 11:54 had a cargo of twenty-five barrels of herrings. The pigeons require very little training, and soon know where to land with their message. A cot has been fitted up on the roof of Messrs. Moir's premises at the quay for the accommodation of the birds, and they invariably alight there on their return from sea.

## CONDITIONS FOR GOOD BASS FISHING.

EDITOR FOREST AND STREAM:

If sportsmen would give the practical features of their knowledge, experience or observation, it would add greatly to the value and interest of their writings. One may tell of glorious sports in fishing for black bass, but how much more acceptable it would be if the conditions under which success was achieved, or which led to success, were given. The time of year, a description of the day, the temperature, direction of wind, the sky, conditions of water, stage of moon, time of day, kind of bait, depth of fishing, kind of tackle, and any observations that may have been made. Here I will mention some items of experience in regard to bait. I have learned by repeated trials and careful notice that there is no minnow, of all the kinds to which I have had access, so good for black bass as the shiner; unless I except one that resembles it in color, but which is harder and lives longer on the hook. I have heard many assertions adverse to this from persons who ought to know, and whose assertions proved only a hindrance to me in arriving at the truth. A minnow marred or disfigured in the slightest degree will be refused when a perfect one will be taken. I am well aware that when

bass are plenty and hungry they will take almost any kind of a minnow or even a piece of one, but when they are shy and hard to tempt the above remarks will apply. One frosty October day, when bass were biting freely and continuously, I discovered that when I baited with a very small minnow, not more than an inch in length—so small indeed that they were regarded as useless until a prospective scarcity of bait induced a trial of them—I took the largest sized bass, weighing from two to two and a half pounds, while with minnows from three to four inches in length I took them weighing generally less than a pound. This occurred under circumstances admitting of so many trials as to prevent the conclusion that it was accidental. Since then I have not noticed the same thing, but my opportunities have never since been so good. This is contrary to all that I ever heard from fishermen on the subject, they always advising large minnows for large bass. I should like to be informed if any one else has had similar experience.

SPLASHER.

## THE ROUTE TO THE UPPER MAGALLOWAY.

JAMAICA PLAIN, NOV. 9, 1877.

EDITOR FOREST AND STREAM:

Having just returned from the Moosehead Lake Region, where I have been busy on my forthcoming "Guide to Moosehead Lake and Northern Maine," I naturally, as soon as I could find time, looked over the file of your valuable journal that had collected during my absence. In the number dated Oct. 18, I found an article headed "The Upper Magalloway River," some statements in which I do not agree with. The writer, speaking of the route to the Magalloway River and Parmachenee Lake, via Upton, Me., spoken of in my "Richardson and Rangeley Lakes Illustrated," states the conveyance between Upton and Errol Dam to be by stage. This statement is wrong, as all traveling that route take the steamer Diamond at Upton. In the morning, after arrival by stage the night before, and having a delightful sail to Wentworth's Location, touching at Errol Dam on the way. If "W. C. E." will refer to page 72 of the Guide, he will find set out in the book that the conveyance is by steamer, and not by stage, as he wrongly quotes. He will also find the route by way of North Stratford and Colebrook, fully described on pages 63 and 67, chapters 14 and 16. I have been both ways, and the Upton route is certainly the easiest and cheapest. The scenery via Colebrook is undoubtedly the finest, as by that route one passes through Dixville Notch. I would recommend that to make a pleasant trip one should go by Upton, and return via Colebrook and North Stratford. By Upton one has a great deal less staging than by North Stratford. The distance from North Stratford to Wentworth's Location, via Colebrook, is 40 miles, and even if you take the steamer at Errol Dam you have 34 miles of staging against 26 miles via Upton. The stage from Bethel to Upton reaches the Lake House at the same time at night as the stage from North Stratford reaches Colebrook, although the distance is 13 miles more. At the Lake House one can sleep until half-past six the next morning, and then be in time for the boat. They do not have to turn out at half-past four, as "W. C. E." says he did at Colebrook.

But I have said enough on this matter, as it is immaterial to me which route sportsmen take to Parmachenee. They will find them all fully described in my "Richardson and Rangeley Lakes Illustrated," and can choose for themselves.

One last correction in regard to the boat on Lake Umbagog. In June and August and September it makes four daily trips per week, instead of three, as "W. C. E." states, and in July only three trips per week.

In regard to the trout up the Magalloway, I would state that they run small on that river, on Parmachenee Lake and the ponds in the vicinity, as compared with those in the Richardson and Rangeley Lakes. A four-pound trout is a big fish for Parmachenee Lake and that vicinity.

The small pond in front of Flint's Camp two years ago contained nothing but small trout, although Mr. Flint has since stocked it with larger fish. But I think it would trouble "W. C. E." to prove that a six-pound trout ever came out of it, or ever was in it, as six-pound trout in that immediate vicinity are as scarce as black flies in January.

In closing, I would suggest to "W. C. E." that the next time he visits the Magalloway, he had better try the Upton route, for if he has never been that way he will find it offers some advantages over the other.

CHARLES A. J. FAIRBANKS.

## HEXAGONAL SPLIT BAMBOO RODS.

EDITOR FOREST AND STREAM:

In your issue of last week, in answer to a correspondent from Leesburg, asking the relative merits of the round and hexagonal split bamboo rods, we observed you give judgment in favor of the former. As our experience as manufacturers is directly opposed to the conclusions you draw, may we, if it will not be considered a presumption on our part, be allowed to state wherein we differ from you, and the reason for our opinion?

You are undoubtedly correct "that the value of a rod depends on its mechanical construction, materials and its working power." You state that "the hexagonal is the easier made, and, therefore, about forty (40) per cent. cheaper."

Our experience is, that it costs as much to make the hexagonal as the round. To make the six parts forming the joint exactly of the same size, so that when put together they will be perfectly fitted, requiring no outside reduction (which would remove a part of the enamel) is a very fine job, and one that only a highly skilled workman can accomplish. The workman who can make a perfect hexagonal joint can make the round equally as well, but there is more skill required in the former than the latter. In the former, if the parts are not closely fitted, any imperfection is readily detected; while in the latter, as the enamel, in part, is necessarily removed to make it round, and the grain of the bamboo exposed, it is a difficult matter to distinguish a defect in fitting from the wood itself, and a poorly constructed rod may appear as well made as the best.

Again, as it is universally admitted that the essentials of a good split bamboo rod—its strength, elasticity and durability, are mainly due to the enamel, it follows, that removing any part of it lessens the value in all these vital points. You state that "the most experienced workman can make the round joint entirely of enamel." That it is an impossibility to make a round joint and preserve even the larger part of the enamel, we know to be the case. The natural bamboo, as you are aware, is not low; to make from this a solid joint in six strips, suitable for a trout or salmon rod, the original circle of the bamboo is so much reduced that the strips, when placed together, do not form a "round" but a hexagon. Now, to form this into a "round," a very great part of the enamel has to be removed. To show this plainly, if you will draw a hexagonal figure, and from its centre describe a circle covering its sides, you will see at a glance the large portion of the enamel destroyed and how impossible it is to make a "round" joint and yet preserve the enamel intact. As the hexagonal form preserves all the enamel, it follows that this is the strongest form in which to make the rod.

As to the "working" of the two forms, the hexagonal having all the enamel and no weak points, gives a uniform swing throughout, while in the "round," from its want of uniformity, the action is unequal.

If a weight is placed on the tip of a hexagonal rod, and the butt is turned in the hand, the deflection will not vary. This ensures proper delivery of the line and case in casting.

Again, the hexagonal, being braced on all sides by the enamel, is preserved from the action of the water, and is therefore far more durable, and will keep its elasticity and straightness under a heavy strain.

We intrude on your space, not for the purpose of advertising our hexagonal rods (for this we do in another part of your paper), but simply that the anglers who use split bamboo rods may have the advantage of our experience in judging the relative merits of the two kinds of rods. We would add that we have, during the past season, placed over ninety (90) of these hexagonal rods in the hands of as many fishermen, and not a single one has been returned to us for any defect.

Respectfully yours,

CONROY, BISSITT & MALLESON,  
Manufacturers, 65 Fulton street, N. Y.

## Answers to Correspondents.

### No Notice Taken of Anonymous Communications.

**137.** A number of anonymous correspondents will understand why their queries are not answered, when they read the lines at the head of this column.

S. P.—The gun advertised is a good one for the price.

M. H. B., Greenville, Pa.—Bogardus lives in Elkhart, Ind.

M. S., Carrollton.—Will do our best, but always a difficult thing to do so many people want just such a dog.

H. P. A., Boston.—When were the Bogardus rules on glass ball shooting published by you? Ans. Aug. 30.

W. S., Rouse's Point.—Will you give me load of gun for different kinds of game? Ans. "Sportsman's Gazetteer."

C. L. J., Texas.—The arm advertised is a good one for the price. Of course, you must not expect a fifty dollar rifle for five.

J. W. W., Brookline.—Where can I get a good rabbit dog, and a beagle? Ans. See advertisements of some weeks ago.

G. A. L.—Will the inquirer about Conlin's gallery give his name and address, as we cannot notice anonymous communications?

A. C. H., Beloit, Wis.—Can you inform me which is the best work on breaking dogs? Ans. Col. Hutchinson's work on the subject.

Dix, Unseland.—What powder shall I use in loading shells for my 45-70 rifle barrel 26 inches, Springfield model? Ans. Hazard F. G.

A. B., Brooklyn.—Does G. W. Simmons sell his tan-colored pilable leather water proof suits in New York? Ans. Most of the principal dealers sell them.

E. W. D., Providence.—Can you tell me if Prang is on the "Turf Register"? Ans. Yes, and raised by S. T. Drane, of Eminence, Ky. Inquire of Mr. Drane as to pedigree.

J. A. C., Hillsboro.—Have had numerous inquiries for what you want but though it is made have not found out where it is to be had. Write us again in a month about it.

W. H. C., Brattleboro.—Why use a black bull's eye instead of a white one? Ans. A white bull's eye would be confusing, and would not stand out in such distinctness as a black one.

W. N. B., Troy.—What is the distance apart of rings used in the target between Helvetia and Zeittler? Ans. By measurement of target now in office, three quarters of an inch.

J. E. H., Millington, Pa.—Where can swans' eggs be purchased? Ans. Swans' eggs are out of season now, and not to be had. Write us in the Spring and we can procure them.

W. and A., Millin.—Can you put us in communication with any one of whom we can procure live quail? Ans. Live quail can be bought at Reichle's, Chatham street near William, New York.

M. M., Reading, Mich.—My Irish setter had distemper last February; at intervals has hot nose, and makes a peculiar noise with his nostrils. What is the matter? Ans. Give the dog no meat for a month or two and exercise him freely.

W. E. S., Bethel, Me.—Is there any market for such a thing as a live eagle? If so, can you give me an address? The bird is a young bald eagle, measures six feet ten inches tip to tip. Ans. Chas. Reichle, 54 Chatham street, New York.

C. G. J., Howell.—I want to buy a breech-loader for turkeys, ducks, pigeons, partridges and woodcock. Please advise me as to bore, weight, choke-bore. Ans. You want a general kind of gun. Choose a 10 gauge, 30 in. barrel, to weigh from 8 to 9 lbs.

C. L. N., Gilhertsville.—1. How soon is it advisable for a young setter to be a bitch? Is good stock the result of crossing a thoroughbred Irish setter with an English bitch? Ans. 1. Not earlier than one and a half years old. 2. There is no objection to such a cross.

CASE, New Jersey.—My pointer bitch's ear is all swollen or puffed up near the head. It seems to be soft as if full of wind. She has had cancer in her head. What is the disease, and what the cause? Ans. Abscess in the external ear. Open with sharp pointed knife.

C. S., Rock Island.—Where can I buy buckskin, and what is it worth? Is there a standard of measurement? Ans. J. P. Powell & Co., of New York. Price about \$3 a pound. Impossible to give a standard, as it varies with size of skins, a dozen weighing from 5 to 20 pounds.

C. W. B., Westboro, Mass.—1. How do furs taken in Florida compare with those of New England? 2. Will it pay to trap in Florida? 3. In what part of the State are the animals most numerous? Ans. 1. Lighter pelts. 2. Quite doubtful. 3. In the middle and western portions.

TEACHER, Lawrenceville, N. J.—Is there any essential difference between position of pointer and setter? Ans. There is no essential difference in the position of pointer or setter in standing frame. For peculiarities of position see any good description of pointer or setter.

AUSTIN OPHIR, New York.—Would like to go to Jacksonville via Nassau, Key West, to west coast of Florida. How shall I go? Ans. A steamer will leave here about Dec. 15th for St. Augustine direct, thence to Nassau. Apply to Murray, Ferris & Co., South st., near Wall.

COCKER, Pittsburgh.—My cocker spaniel, 6 years old, has from three to five attacks every day, with violent jerking and twitchings. Think he must have been poisoned. Ans. Your dog has Epileptiform convulsions. Strychnia must be the exciting cause. Hardly think a cure possible.

H. H., McKeesport.—My dog, two years old, has eyes slightly inflamed. Nose cool and moist. Sneezes frequently; appetite good; restless when lying down. Ans. Looks very much like worms from the symptoms. Give him area nut, followed by an emetic, or some common salt the day afterward.

P., Galveston.—What do you know about the F—gun? Ans. It is a reliable gun in every way, and is all that it is represented.

P. B. T., Tilsenburgh, Ont.—I have a litter of pointer puppies, three weeks old, much bothered with fleas. What shall I do? Ans. Rub them over with kerosene and wash with tepid water, or use Persian insect powder.

ROVER.—What point in Delaware would you advise as good for duck, quail and partridge shooting? Can stay a week; intend leaving the city about the 19th. Ans. Take the railroad from Wilmington, Delaware down the peninsula and any one of its lateral branches will give you the shooting you want.

W. A. L., Great Barrington.—1. Is 50 grains powder enough for a pellet of 270 grains, 44 cal., 500 yards? 2. Will a rifle shoot better with a thin wad between powder and ball? 3. Will the score be much greater with 70 than 50 grains? Ans. 1. Yes. 2. Advise using a wad. 3. Recoil increases with powder.

R. H. L., Raleigh, N. C.—My gun, 12 bore at breech and 13 at muzzle, suddenly grows larger three inches from the muzzle and contracts again at the muzzle. Is that the way a gun is choke-bored? Ans. Yes, it is a choke-bore. Have seen them made expanding to half way down the barrel and then contracting.

TILSON, Ont.—What do you think of pin-fire breech-loaders; are not the shooting qualities, rapidity, etc. nearly as good as the central-fire? Ans. Pin-fire guns are getting out of date, although their shooting qualities were good. Rapidity perhaps as great as of centre-fires, but the trouble was in the preparation of the ammunition.

W. O. W., Charlottesville.—Can the Beach combination sight be used to advantage on a 32 cal. sporting rifle? If the peep sight is put on the barrel where the regular open sight is usually that will it not be too forward to use it in off-hand shooting? Would you advise my having a Beach combination sight on my Remington rifle? Ans. 1. It can. 2. It would be. 3. We would advise it.

YALE, New Haven.—Dog has some kind of mange; skin is red and sensitive, eyes inflamed, danks drawn in, vomits sometimes after eating. Ans. Use a small quantity of proto-iodide of mercury ointment once a day over the parts most affected, for 4 or 5 days; then rub the dog thoroughly with kerosene, and two or three hours after, wash with tepid water and carbolic soap. Repeat this treatment if necessary, and in the meantime, give the dog no meat.

C. R. H., Boston, Mass.—From the description of the case—puppy looking stupid—our answer would be that you had been over-feeding the animal, and that he has simply distemper, for treatment of which we refer to our columns. [With the best disposition in the world, we beg to state to this correspondent that it is utterly impossible to answer by letters questions sent us. If we transgressed from this rule, six extra clerks could not keep up the correspondence.]

MAMBATAN.—I want a receipt for staining wood to resemble mahogany, also a good remedy for distemper in young dogs. 1. Boil ½ pound madder and two ounces of logwood chips in a gallon of water, and brush well when hot. Go over the whole with a solution of pearl-ash, two drachms to the quart. 2. The treatment is long and adapted to the violence of the disease. Commence with some flour of sulphur; give a gentle purgative. See article on distemper in the "Gazetteer."

BACK ACTION, Norton.—Do you think an 8½ lb bore B. L. gun too light for ducking, and how much powder and shot would be a proper charge for such a gun? 2. Is 20 snipe out of 26 shots good shooting for a person who has had only two years' practice shooting on the wing, and also, is 3 out of 5 quail and 3 out of 5 pigeons good? 3. Do you not think a 9 bore, 10 bore gun large enough for a boy of 17 to carry on ducks? Ans. 1. Rather light, but will do very well; 4 drs. powder, 1½ oz. shot. 2. Yes, good enough. 3. Rather heavy for a boy.

JOHN, Hornellsville.—There are a number of gentlemen here advocates of the muzzle-loading rifle, who would like to hear about the Fisher muzzle-loader through your columns; weight and shape of ball, calibre, etc., and also about the Warner rifle. Ans. There is no rifle called the Fisher rifle. Some years ago D. Fish made a good rifle. Very few went into the market. They were of various calibres. Think Messrs. Schuyler, Hartley & Graham, of New York, have some few. The Warner arm was a carbine and is entirely out of the market.

ANXIOUS SUBSCRIBER, Grand Rapids.—My cocker spaniel seems to have had a fit after having been attacked by a cur. He is a plucky dog, but has acted stupidly since. There is a sore on the back of his neck, as if from a bite. What is the matter? What shall I do for him? Ans. Your dog's fit was probably the result of over excitement in the fight and fatigue from running. It is also possible that distemper may have been developing. If he has the latter you must consult proper authorities for treatment. In any case keep him warm and quiet and give him simple diet.

F. G. L., Boston.—I want to have a new pair of barrels made. Is there any difference between the penetration from Damascus twist and laminated barrels? 2. Would I be able to get as much penetration from a 23 in. as a 30 in? 3. For brush shooting is it possible to have a gun under 8 lbs. weight to shoot as strong as one over that weight? Ans. 1. No difference. 2. More with a 30 in., as it could take more of a charge. 3. About 23 in. is what we would advise; the weight you mention would do. Of course heavier guns carrying more powder shoot stronger.

J. B. A.—1. Will a 44 cal. rifle rim fire shoot a ball made with patch? Would the patch be torn where it took the riding which is intended to take a patched ball rammed out any at the breech end? How are the grooves in a bullet mould for grooved bullets made? Why, in a rifle which has open sights and a rear peep sight, when you look over the open sights through the peep sight, does the open sight look so much clearer? Ans. 1. Shoot the naked ball. No more than is intended to take a naked ball. 2. Turned into the metal of the mold. 3. A question of optics, and would require diagrams and three columns of text.

DOCTOR, Boston.—I have a setter bitch, 6 years old, who for the last four years, has had something the matter with his nose. Scales form, which seem to go away under treatment, and then return. Have thought it a case of favus, caught from a cat. Have looked for parasitic spores with microscope. Ans. You are probably right as to your Nosological Diagnosis. The causes must be looked for in malassimilation of food. Probably an alteration of diet, tonics and plenty of sharp exercise in the open air may do good. How often do you cure eczema (chronic) among your patients? Possibly the dog may prove more amenable to treatment—glycerole of lead externally.

SPLASHER.—Please give the best way to hook the living hellgramite. Is the hellgramite capable of biting the hand painfully or injuriously? Also, give the conditions of a first-class day for black bass fishing. Ans. The hellgramite is harmless. He is carnivorous as well as herbivorous, and can bite, but he never seems to wish to. Put him on the hook so that his tail will be downward and his head up. Tie him on with silk, if you prefer. It is more trouble, but answers better. We always tie our meat and grub bait and worms upon our hooks. It does not make much difference whether the day is bright or cloudy, so that the wind ruffles the water—this is essential. Water should be clear.

BONSTAY, Chester, Pa.—We have repeatedly told our correspondents that there was really no proper American Yachting Manual. What we require is a work something like "Vanderdeken's Yacht Sailor," published in London. We have a list, however, of thirty-six works, which treat on ship-building, navigation and nautical subjects of more or less value. Brady's "Kedge Anchor," published in 1864, can possibly be bought at the nautical stores. Marrett's "Yachts and Yacht Building," 1873, is very serviceable; also, Butt's "Sailmaking," and Meade's "Naval Architecture." These can be bought of John Wiley & Sons, 16 Astor Place, New York. Rankine's celebrated work will cost \$35.

F. H. Y., Fishersville.—Does a breech-loader shoot harder and closer than a muzzle-loader? What do you think of the W. breech-loader? Do you think concentration improves close shooting? What kind of paper shells are the best? My dog has spots on his nose and body—looks like mange. 1. Not necessarily—the preference is now given to breech-loaders. 2. As good gun. 3. Certainly. 4. Many kinds are good. We use the U. M. C. 5. Wash the dog with Hazard & Co. juniper tar soap. If this does not answer, use sub-carbonate of potassa, two drachms; water, an ounce; olive oil, one half ounce, green camphor, two drachms, and sublimate sulphur, five ounces. Mix and rub in well.

A. F. DRESSEL, Spadia, Ark.—Please tell me whether the goose described below is the young of Hutchin's goose, and if not, what it is? Size about the same as *albifrons*; legs and bill orange; upper part of neck and head grayish brown, darkest at base of bill; becoming a little darker on back, where each feather is tipped with gray; under part of neck lighter than upper, fading to grayish white on breast with white upper and under tail coverts. Tail feathers 16; color, black tipped with white, wing black, white quills; wing covert dark gray, some feathers with white edges. No white at all on head, with the exception of a narrow strip, about an inch in length, on the throat, commencing at the bill. Ans. Certainly not the young of Hutchin's goose. Probably the young of *Anser albifrons* var. *gabekli*, though we could not say positively without an examination of the specimens.

READER, Chicago.—1. Please give directions for making snow-shoes. 2. Please state the names of the trees likely to be found in the northern central part of the U. S. and lower central part of Canada. Ans. W. H. Gibbons' "Complete American Trapper," published by James Miller, New York, says on page 353: "The framework should consist of a strip of ash, hickory or some other elastic wood, bent into the required shape, and wound around the ends with twine or strips of hide. The length of the piece should be about six feet. If the bending should prove difficult, it may be rendered easy by the application of boiling water. Across the front part two strips of stout leather, or other tough hide, are then fastened, and these further secured together by three or four bands on each side of the middle. In the original Indian snow-shoe the network is constructed from strips of moose hide, which are interlaced much after the manner of an ordinary cane seated chair. To attach the network to the bow, the latter should be wound with strips of cane or tough skin. Run the first lines across the shoe from side to side, passing through the windings of the bow. Across them, in the form of a letter N, the other cords should be interlaced. Another method of attaching the lace-work is by a series of holes bored at intervals through the wood; but this tends to weaken the frame. 2. The kinds of trees you inquire for are beech, birch, poplar, ash, hickory maple, and all the varieties of the conifers."

## PAPER SHELLS.

Manufactured by the Union Metallic Cartridge Company, are Superior to any Shells of the Same Grade in this Country or Europe.

They are SURE FIRE, will not burst in the gun, and are warranted to shoot as well with the same charge of powder as any shell in the market. A letter published in the *Chicago Field*, Sept. 22, giving the result of a trial made with No. 12 St. Louis Shells which are claimed to save 25 per cent. of the powder, and give almost no recoil to the gun and No. 12 Bridgeport Paper Shells, says:—

"Four of each loaded with 3, 3¼ & 3½ drachms of Ladin & Rand's powder, and all with 1½ ounces by weight, or 363 pellets to the charge counted, of No. 7 Chicago-shot. Distance 40 yards to muzzle of gun, target a circle 30 inches in diameter, a bull's-eye center, 1½ inch circle penetration pads 9½ inches by 1½, 30 sheets to pad, made of heavy, hardware paper, 30 sheets large enough laid on each other making 34 pads. The gun was shot resting across a bag filled with straw. The following is the result:

| ST. LOUIS PAPER SHELLS. |                                |                |                         |          |
|-------------------------|--------------------------------|----------------|-------------------------|----------|
|                         | Pellets in Pellets in          | Pellets in     | Sheets penetration by 3 |          |
|                         | Bulls Eye, Pad, 9½ by 1½ inch. | 30 in. circle. | 1½ inch.                | Pellets. |
| 3 Dr. Powder.           |                                |                |                         |          |
| 1 R. B. ....            | 0                              | 54             | 240                     | 18       |
| 2 R. B. ....            | 2                              | 37             | 228                     | 19       |
| 1 L. B. ....            | 3                              | 54             | 213                     | 16       |
| 2 L. B. ....            | 3                              | 43             | 240                     | 17       |
|                         | 7                              | 183            | 958                     | 70       |
| 3¼ Dr. Powder.          |                                |                |                         |          |

All the shells were loaded precisely the same as near as I could load them, with one black and one pink edge wad over powder, and one black edge wad over shot. I have no comment to make on the relative merits of either shell, the figures stand for themselves. I could see no difference in the recoil of the paper shells. I think the reliability of the Bridgeport paper shell is worthy of mention, having used a large number in the past three years without having one misfire. I can't say as much for any other paper shell I ever used.—J. G.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL, NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INDOOR AND OUT-DOOR RECREATION OF MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND SPORT.

PUBLISHED BY

**Forest and Stream Publishing Company.**

—AT—

No. 111 (old No. 103) FULTON STREET, NEW YORK.

[POST OFFICE BOX 2832.]

TERMS, FOUR DOLLARS A YEAR, STRICTLY IN ADVANCE.

Twenty-five per cent. off for Clubs of Three or more.

#### Advertising Rates.

Inside pages, nonpareil type, 25 cents per line; outside page, 40 cents. Special rates for three, six and twelve months. Notices in editorial columns, 50 cents per line.

Advertisements should be sent in by Saturday of each week, if possible.

All transient advertisements must be accompanied with the money or they will not be inserted.

No advertisement or business notice of an immoral character will be received on any terms.

\* \* Any publisher inserting our prospectus as above one time, with brief editorial notice calling attention thereto, and sending marked copy to us, will receive the FOREST AND STREAM for one year.

NEW YORK, THURSDAY, NOVEMBER 15, 1877.

### To Correspondents.

All communications whatever, intended for publication, must be accompanied with real name of the writer as a guaranty of good faith, and be addressed to the FOREST AND STREAM PUBLISHING COMPANY. Names will not be published if objection be made. No anonymous contributions will be regarded.

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions.

Nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for dereliction of the mail service if money remitted to us is lost. NO PERSON WHATSOEVER is authorized to collect money for us unless he can show authentic credentials from one of the undersigned. We have no Philadelphia agent.

Trade supplied by American News Company.

Western Manager.

HOW WE SUFFER AND THE REASON WHY.—Messrs. Dudley & Co., of Poughkeepsie, has sent us the following very complimentary sockdolager:

POUGHKEEPSIE FOUNDRY, POUGHKEEPSIE, N. Y., Nov. 9, 1877.

EDITOR FOREST AND STREAM:

We wish you to discontinue our advertisement of the "Dudley Pocket Cartridge Loader" till further advised, for we have orders now on our books (and most of them paid for in advance) that will take us three weeks to fill. If any one doubts the value of an ad. in the F. and S., we do not. Yours, DUDLEY & CO.

P. S.—We will notify you when to resume our ad.

—Professor Baird's sojourn in Halifax this summer, where he upheld the interests of the American fisheries, seems to have given new health and vigor to the Secretary of the Smithsonian Institution. We are very glad to acknowledge our indebtedness to Professor Baird for many favors.

A ROBBERY.—We are sorry to learn that the store of Mr. J. F. Marsters, of Brooklyn, has been robbed of a large amount of valuable cutlery. Mr. Marsters still advertises in our columns, and we are quite sure that the thieves did not make a clean sweep.

SALE OF OLD ARMS, ANTIQUE FOWLING-PIECES, ETC.—We would call particular attention to the finest collection of ancient arms and armor ever offered for sale in this city. The Cognat collection will be disposed of at auction by the Messrs. Leavitt at their Art Rooms, 817 Broadway, on Nov. 17th and 19th, at 3 o'clock. This museum of arms, it must be remembered, was one of the most prominent features of the Metropolitan Museum of Arts, having been exhibited there for the last two years. Here may be found weapons used by the Crusaders, genuine Toledo blades, and others which preceded the use of gunpowder—crossbows, the rare halberds, the carefully wrought steel weapons of Spain and Turkey.

To the sportsman this collection offers the greatest inducements. In it may be seen early guns used for fowling-pieces, with bird bolts, and the lighter crossbows that Florentine ladies used hunting with. There is a collection of powder flasks which is unique. From a personal study of the collection we can safely state that the authenticity of each piece is positive and beyond a doubt. This sale should claim the attention of all gentlemen sportsmen and collectors of arms.

### THE NATIONAL RIFLE ASSOCIATION AND THOSE WHO DO NOT BELIEVE IN IT.

IT would naturally be supposed that the attention of the *Army and Navy Journal* would be called to the mistake made, upon which its attack on the existence of the National Rifle Association was based. We all make errors at times, and should freely admit when such blunders occur. Nevertheless, the *Army and Navy Journal* goes right ahead and devotes two columns to an elaborate endeavor attempting to demonstrate that the "Creedmoor Association" and the "N. R. A. of New York" is in no way or sense national, but "represents only the interests of New York City and Brooklyn, with so much of the State Militia as is covered by the ex-officio directors."

Truly the gentlemen of the National Rifle Association may well cry "Save us from our friends." We fancy that *The Turf, Field and Farm* is correct when it states that the present attack proceeds from parties who "had recognized the association for years and have always arrived at controlling its councils, and that the sudden change proceeds from a failure to dictate its course." It is difficult to explain the course of the *Army and Navy Journal* upon any other hypothesis. When the editor of that journal was the president of the National Rifle Association that paper was recognized as its organ. The latest information on rifle matters was always to be found in its columns, and it often spoke by authority. This position might have been retained by a little enterprise, but that is a quality for which journalists know that paper is not celebrated. While other newspapers have paid special attention to rifle practice the *Army and Navy Journal* has gradually neglected it since its editor retired from the presidency of the N. R. A., and its dicta, although oracular in form, have for some time been of no possible authority with riflemen. Having therefore abdicated its right to speak for riflemen it is not extraordinary that those who do understand their wants and wishes should decline to be guided by its advice.

A glance at the files of the *Army and Navy Journal* will show that no paper has been more prominent in asserting the national character of the Rifle Association. At the first conception of the association it stated that it was to be national in its character, as its name implied, regularly "incorporated, etc." In the address which was issued at the same time under Col. Church's auspices the object of the association was stated to be "to secure the adoption of rifle practice by national guards of this State through the military authorities, and to secure similar action in other States." In June 1873, the *Army and Navy Journal*, when it described the opening of Creedmoor, stated in an editorial "that the association is established on a firm basis and upon a scale which justly entitled it to the name National." Last fall in a discussion with the *Pacific Life* as to who was entitled to the credit of being the founder of the "National Rifle Association of America," the journal in claiming the credit for itself and Col. Church, (which was no more than their just due) asserted that the association was formed by them "as a National Rifle Association on American principles." It seems quite extraordinary in view of these repeated expressions that the *Army and Navy Journal* cannot now speak of the N. R. A. except with the addition of *New York*, or as the *Creedmoor Association*. This is scarcely dignified on the part of the journal in question, and what its object may be is quite a mystery. Its reputation once in the newspaper world was due more than anything else to its persistent efforts to establish a National Rifle Association: If it should now succeed in reducing this association to the level of a local club, as it now seeks to do, its own reputation will be destroyed. But this is its own affair. We would advise the N. R. A. not to unduly exercise themselves over this matter. The world is wide and time blunts the harshest censure. The public will estimate whether it is, or is not, national by the work it performs, not by what it calls itself, or others may call it. No one can deny that from its inception to the present time (and much of it was due to Col. Church) the National Rifle Association has been national in its aim and work, and has honorably and creditably filled its mission by representing the riflemen of America. So far no dissatisfaction has been expressed even by those who now oppose it. The steps it took last year in paying the expenses for places upon the American team was a movement in the right direction toward enabling the riflemen of the West and South to secure representation, and this action will certainly be followed in the future. Its exertions at this present time to secure and establish rifle practice in the different States is also of a national character.

So long then as the N. R. A. proceeds in the course which it has entered upon and labors to advance rifle practice throughout the union it may be certain that it will be looked up to as the representative body it rightly claims to be. It certainly cannot be deprived of this character by adverse criticisms based upon the utterance of a resolution which it never passed and which, even had the association passed, the FOREST AND STREAM AND ROD AND GUN believes would have been perfectly proper.

MAP OF MOOSEHEAD LAKE AND VICINITY.—Mr. C. A. J. Farrar, of Boston, has just completed his map of Moosehead Lake and Vicinity. The map is bound in convenient form in cloth covers, and will prove a valuable aid to the tourists in the Maine woods.

### SOME GOVERNMENT PUBLICATIONS.

CERTAINLY we in America have every reason to be thankful that our government preserves so wise and so liberal an attitude toward science and its achievements. No year within the past decade has gone by without some important contribution, through government aid, to our knowledge of the geology, zoology or topography of our country. And, indeed, for many years back expeditions have been sent out in all directions, equipped at great expense, furnished with the best instruments that money could buy, and accompanied by men trained for work in the field, to gather in the scientific treasures so abundantly scattered throughout the land. It is true that at first these expeditions were sent out only for a practical (sic) purpose; but as the years rolled on, and the importance of scientific research came to be more and more appreciated, the investigations were carried on for their own sake. Of the immense advantages which are constantly accruing to all classes of people through the progress of these government surveys it is needless to speak at length. The good service which Dr. Hayden's Entomological Commission has rendered in crushing out the grasshopper in several States will be remembered and gratefully acknowledged by all agriculturalists; and the advice and assistance of the trained geologists and mineralogists connected with these surveys is constantly sought for by miners in new countries.

Of the publications which have been sent forth from the government printing office within the past few years, the most noteworthy are those issued in connection with the two surveys under the control of the Interior Department, in charge of Dr. F. V. Hayden and Major Powell respectively, and the two under Lieut. G. M. Wheeler, U. S. Engineers, and Mr. Clarence King, which are published by the War Department. Among the names of the contributors to the volumes issued by these surveys will be found those of all the most eminent specialists in this country, besides those of many of the most noted scientific men of Europe—Leidy, Marsh, Meek, White, Cope and Scudder in paleontology; Allen, Coues, Yarrow, Henshaw, Packard and Thomas in zoology, who, with geologists, botanists and miscellaneous writers too numerous to mention, make up a company of scientific men of whom we, as Americans, have certainly every right to feel proud.

The publications of Dr. Hayden's survey extend back the farthest and are the most numerous of any of the scientific publications now being issued by the government. So far as published, they consist of no less than eight Annual Reports, supplemented by a number of volumes of Bulletins and Miscellaneous Publications. Then, too, Dr. Hayden, with a wisdom and liberality as far-seeing as it is enlightened, has enlisted in the service of his survey many of our leading specialists, who have undertaken to prepare for him a number of superb monographs on various subjects, which are to be printed under the direction of the geologist in charge. Some of these are still in course of preparation, but there have already been issued the following works: Prof. Leidy's Extinct Vertebrate Fauna of the Western Territories; Prof. Cope's Cretaceous Vertebrata; Prof. Thomas' Synopsis of the North American Arctidia; Prof. Lesquereux's Cretaceous Flora; the late Prof. Meek's Cretaceous Invertebrata; Prof. Packard's Geometrid Moths, and a Monograph of the North American Rodentia, by Dr. Coues and Prof. J. A. Allen. All of these works are quartos, and all are finely illustrated with lithographic plates. While most of these magnificent volumes are interesting only to the specialist, the Monograph of the Rodentia is to be mentioned as an exception to this rule; for there is much in it relating to the habits of the hares, squirrels, beaver, etc., which will be delightful reading for the sportsman. But, after all, it is hardly necessary to say this, for are not the names of Coues and Allen well known to all the readers of FOREST AND STREAM? The miscellaneous publications of this survey are many of them very fascinating, and are, besides, of vast practical importance. They include such volumes as Dr. Coues' Birds of the Northwest and Fur-Bearing Animals; Matthews' Hidatsa Indians; the Reports of the Entomological Commission, etc., etc. Here, too, are to be placed the many hundred photographs which have been secured of scenery, ruins, and of the different types of Indians, of the plains and mountains.

Of Lieut. Wheeler's report, only three volumes have as yet made their appearance, these being devoted to geology, zoology and paleontology. That on zoology—the one in which our readers will be most interested—is a grand work of over 1,000 pages, and is illustrated by forty-five beautifully colored plates. The mammals are ably treated by Dr. Coues and Dr. Yarrow; the birds by Mr. Henshaw; the reptiles and Batrachians by Coues and Yarrow, and the fishes by Yarrow and Cope. Yarrow, Verrill, Uhler and others pronounce upon the invertebrates, while the whole charge of the volume devolved on Dr. Yarrow, who has most successfully fulfilled the arduous duties in connection with its preparation. Issued by the same survey are a series of beautifully engraved maps, which are ultimately to cover the whole of the territory assigned to it for examination.

Of the volumes of Mr. King's survey, it need only be said that they are in every way creditable to those who have had them in charge. The last volume issued is by Prof. Ferdinand Ziskel, and treats of the rocks collected during the progress of the survey. Of this work a recent *Nature* says: "Mr. King may be congratulated upon the judgment he has shown in the allocation of his materials. He has enriched his

official publications with the most important contribution yet made to the petrography of America."

The country through which Major Powell has passed in his exploration of the Colorado River furnishes a constant succession of the most strangely beautiful scenery. Exploration here, however, is no light task, for the travel by boats down the swiftly flowing stream, through the deep canyons and over hurrying rapids, is fraught with great danger. The toilsome experiences of the journey are well told of in the reports of the survey and are often of thrilling interest, while the scientific results of the exploration will, when published, be of extraordinary value. Major Powell has devoted much time to the study of the ethnography of the various tribes with which he has come in contact, and the material which he has thus acquired will be elaborated in a future report. Dr. H. C. Yarrow, it is known, is preparing a paper on the Burial Customs of the North American Indians, which will appear in the publications under the charge of Major Powell. Dr. Yarrow has had a vast amount of experience in investigating these customs among the Indians of the Southwest, and his paper will be anxiously looked for by ethnologists.

It is impossible, in the limited space at our command, to attempt to give credit for all the good work that has been done by the various scientific men who have been connected with the explorations to which we have referred. We have therefore been obliged to content ourselves with naming only a few of the many who have assisted in the accomplishing of the great results which have been already attained. Let us hope that the work will continue to go forward in the future as bravely as it has in the past, and that the government may continue to do its part toward helping it on.

#### A SPORTSMAN'S REGISTRATION BOOK.

WE are indebted to a correspondent of the *FOREST AND STREAM* AND *ROD AND GUN* for what we deem to be a most excellent suggestion. We might as well remark right here how fully we appreciate the kindness of the many friends of the paper. We are ready to acknowledge the benefit we have derived from the numerous counsels we have received. A proposition is made that we shall keep in the office of this journal a regular book, in which parties who intend visiting any portion of the United States or Canada, for the purpose of shooting or fishing, may record their names and their addresses. Our correspondent says: "A man wanting to go to any particular locality and desiring company might enter his name, address and reference, with the locality he proposes visiting and the time he purposes to be absent. Thus any one who may desire company may obtain information that might not be attainable otherwise, without the expenditure of much time and trouble. There are doubtless, in this vicinity, many sportsmen who have few, if any, acquaintances, who would be glad to give some small fee to pay for the time and trouble of keeping such a book." As the time and trouble of the *FOREST AND STREAM* AND *ROD AND GUN* are quite at the disposal of the public, we shall be perfectly willing to open such a book without any remuneration. We believe such a plan as proposed would be of great service to sportsmen generally. Few days occur that we do not receive either letters or personal inquiries in regard to the whereabouts of gentlemen. As far as lies in our power we keep track of their peregrination. It is often difficult to follow their trails. We would not propose, unless parties should wish it, to give in print their names and destinations. Such a book as we are now ready to open at the office of the *FOREST AND STREAM* AND *ROD AND GUN* would be of a strictly private character, and only accessible to such gentlemen as are either known to us or could bring letters of introduction to the editor. To our numerous English constituency, who take long journeys West for the sake of sport, such a book of reference, informing them of the movements of their friends, might be of the most signal service.

We certainly think, then, that a trial of this method of registration might be of great service, and have opened this day at our office, No. 111 Fulton street, New York, a book for the purposes designated.

It is becoming for us to say also, in this connection, that we have very materially assisted in designating routes and programmes of sport for very many of the foreign gentlemen who have visited America during the past four years. Included among whom are Rosebury Dunraven, J. Shafto Hawks, the Turkish Consul-General at Boston, the members of the Irish and British Rifle Teams, and scores of others. The citizens of our own country who have sought and received our personal services are very numerous, and we feel thankful that the thirty years of a somewhat erratic life have not been wholly thrown away, and that the results of many wanderings over all parts of the continent can now be put to practical use. We say this modestly: we can no longer reproach ourselves for a misspent life.

CONGRATULATIONS.—We extend our hearty congratulations to the New York State Sportsmen's Associations, and to the sportsmen of New York on the excellent representation their interests are likely to receive in the coming session of the State Senate. Senator Pierce of Buffalo, the President of the Association, and Senator Wagstaff of Long Island, one of the standing committee were both on the successful ticket at the late election. We profess to know nothing of the political views of these gentlemen, but we are assured that the interests of game protection will be worthily represented at Albany.

#### DISAGREEABLE RESTRICTIONS.

INTERESTING TO SPORTSMEN WHO SHOOT ON THE ST. LAWRENCE.

Mr. John R. Wiltzie, of Newburgh, in this State, president of the Hudson River Association for the Protection of Fish and Game, has called our attention to what we consider a very rigid interpretation of the Canadian laws, which, being quite important to our American sportsmen, we give somewhat in detail. Of course, from his position as president of an association for the protection of game, Mr. Wiltzie has the utmost respect for the laws, whether at home or abroad, and is ready to abide by them.

Toward the close of last month, Mr. Wiltzie, being the guest of H. H. Warner, Esq., of Rochester, on board of his steam yacht *Olive*, crossed over from Clayton, N. Y., to Kingston, Canada. The object of these gentlemen in visiting this particular part of the St. Lawrence, was to shoot ducks. Fully aware that they might be subjected to some inconveniences from the authorities if they shot game without permission, they were only too desirous to put themselves entirely in the right. Treated somewhat curtly by the Custom House officers at Kingston, by payment of \$1.50 they obtained the following permission, an accurate copy of which we give:

The steam yacht *Olive*, with a party of two gentlemen, have reported to me, and have the privilege of shooting on Canadian waters for two weeks, on condition that she (the yacht, presumably,) reports to an officer in and out every night.  
(Seal of the Port of Kingston.)

A. MACALISTER,  
Surveyor of Customs.

Now, there is no possible objection to having sportsmen register their names, and even to pay for the privilege of hunting in Canada, but the final clause, the necessity to report the vessel "in and out every day," would be not only irksome, but often impossible; as, in the case of these gentlemen, sometimes the weather was so bad that after a day's shooting it was impossible to return and report at Kingston. It must be remembered that in case of non-compliance with these arbitrary orders, a penalty something like seizure follows, and the giving of bonds. Mr. Wiltzie, who is well known as a sportsman in this section of the Province of Ontario, informs us that he has been shooting there for fifteen years, and never knew such restrictions enforced before.

Somewhat astonished at the course of the Canadian officials, Mr. Wiltzie addressed a letter to the Collector of Kingston, and had the following answer:

CUSTOM HOUSE, KINGSTON, Ont., Oct. 20, 1877.

Sir—In reply to yours of the 16th inst., as to a new law supposed to be in force in this Dominion, making it necessary for persons from the United States to pass through the nearest Custom House and enter his boats, guns, etc., I beg to state that there is no new law in force, the notice referred to having been issued in consequence of American sportsmen imagining that they can come and go as if on their own side of the line.

If Canadian sportsmen or fishermen enter American waters to shoot or fish they are required to report at the nearest Custom House, and, in default, are liable to have their property seized, and subject themselves to a fine. In fact, cases have occurred in which their boats and goods have been seized for simply trolling in American waters.

By XL Victoria, Chapter X, Section 10—all goods imported into Canada, whether by sea, land, coastwise, or by inland navigation, must be brought in at a port of entry where a Custom House is lawfully established.

By Section 11 of the same act—if not so brought in and a permit given, such goods shall be forfeited with the vessel, etc., and the master or person in charge incurs a penalty of \$300.

By Section 2 of the said act, called the "Interpretation Clause," the word "vessel" means any ship, vessel or boat of any kind.

With reference to the manner in which these acts are carried out on both sides, I further state:

That on the American side I have always found a most liberal construction placed thereon, provided a report is made by a responsible person and a permit obtained;

That on the Canadian side the same liberal interpretation is also placed thereon;

That owing to the supposition of American sportsmen they can come in here as and when they please, the notice referred to has been issued to prevent misunderstanding, and to compel those who wish for a privilege to obtain it in a lawful manner.

Your most obedient servant, W. R. MINGAYE, Collector.  
J. R. WILTZIE, Esq., 43 Second street, Newburgh, N. Y.

Possibly some slight exceptions might be taken at the conclusion of Mr. Mengaye's letter. The Canadian officials may look at the visits of American gentlemen in their yachts rather as directed toward infractions of the customs than of breaking the game laws. Of course the manner and way in which such orders are carried out have a good deal to do with the subject. As the French say, "It is the tone which often gives the pith to the song."

—Judge Caton, of Ottawa, Illinois, so well known as a naturalist, and whose contributions have often graced our pages, will shortly visit the Pacific coast for health and recreation. He will remain during the winter.

THE SIMMONS SHOOTING SUIT.—We wish to call the attention of our shooting friends to the column advertisement in our paper of the celebrated outfitting house of G. W. Simmons & Co., Oak Hall, Boston. Some description of the popular shooting suit which this firm manufactures is there given. We have given one of their coats a very thorough test during a recent two months' vacation ramble in the West, wearing it constantly, and cannot speak too highly of the comfort it afforded us and of its perfect adaptation to the requirements of a rough-weather sportsman. It will shed ordinary showers like a duck's back, but does not fully answer the purpose of a bathing suit. It is practically waterproof to a degree. For convenience in carrying shells and game, it is not excelled, and in the bush it saves many a scratch and tear. We shall never hunt without some suit of this description.

#### VACATION RAMBLES IN MICHIGAN, WISCONSIN AND MINNESOTA.—No. 5.

By THE EDITOR.

NOVEMBER 15, 1877.

BRETHREN: Chroniclers say that the Indian name for Michigan is "Michisawgyegan!" Nothing niggardly about the old time aboriginals. They had no more letters in their alphabet than the palefaces had; but they found less use for them, and so gave fuller measure—more letters to the yard. "Michisawgyegan" means the Lake Country; a very poetic and proper signification in the vernacular, no doubt, but we modern philologists would expect more liquids (lake, water, liquid) among so many consonants.

The lakes of Michigan possess a beauty peculiarly their own. One who has never visited them cannot conceive their charming character. Some centuries ago the entire country was submerged. After that the water subsided gradually, leaving level benches or plateaus around the margins of many of them, which at the present day mark the stages of their successive recedings; so that nature has really laid out this delectable lakeland with a series of terraces already graded. She has clothed their sides and summits with beautiful forests of oak, hemlock, pine, beech, maple, radiant mountain ash, and fruitful hazel. She has encircled each crystal basin with a pebbly rim, and filled the teeming waters with toothsome and sportive fish. Gelled springs gush from every hillside, and the outflow leaps into the lakes in rippling rivulets, or min-gles in fuller and more quiet volume. Deer and wild fowl stroll into the cool of their quiet retirement for refreshment and undisturbed rest. On the lower terrace the sagacious farmer lays out his lines, and behind the shelter of the upper ridge finds security from the northern blasts. Flowers bloom there in an unwonted latitude; fruits of the orchard and vine redden and grow heavy; and Indian corn ripens in golden fruition in the warmth which seems more genial because it is so exceptionally bestowed.

I love the lakes of Michigan in their summer moods; but when the birds leave in autumn I would fain leave too. This is because I am myself a bird of passage. Others may elect to dwell there the entire round of seasons through. I cannot condemn their choice. Home is where contentment dwells, and without contentment it matters not whether we abide in snow-clad Michigan or in the balmy "isles of Ind." When my bird returns in spring from restless winter journeyings over tropical seas, I may hope that he will bring back an olive branch as a symbol of some place of final perfect rest—of some *Ark-adia*, such as I suppose Noah found after the dove came back to him.

Three months ago, when the little propeller, beneath whose awning I sat, steamed out from under the wood-crowned cliffs of Mackinaw on her regular trip to Cheboygan, the old guns were still bristling on the battlements of the ancient fort, but flowers and shrubbery almost hid them from view, and peace and perfume filled the air. No menacing enemy provoked their fire. They had survived their usefulness; but the little garrison had marched away for the hills of Pennsylvania to quell discussion among our kindred. So shall we never know precisely where we shall be called to fight the battle of our lives. The foes may be those of our own household, where the altar fires should burn the brightest and the lares keep sacred ward against intrusion.

I left Mackinaw with the regret a benighted traveler feels when a passing cloud obscures the moon. The strait was beautiful; its blue waters were everywhere flecked with the white sails of the many distant vessels that were passing through from one great lake to the other. Gulls circled aloft, and now dipped into the waves. Two or three followed us into the mouth of the Cheboygan River. Here the State has spent much labor and money in deepening its channel to make it navigable for such craft as ours and the many timber rafts and bark boats that are annually floated through to the saw-mills and shipping below. We encountered a jam of logs just above the town, wedged so tightly together that a profane man on board declared we would be jammed before we ever got through! Yet, with boat hook and setting poles we gradually worked our passage, pushing aside the pliant logs and occasionally crowding on steam "jumped" the obstinate ones, forcing the boat clean over them. Once when visiting the back lakes of Canada I remember an exciting occasion when we thus jumped a boom, which, having been stretched across the river and secured by heavy chains, barred all passage. Episodes of this sort are of so frequent occurrence there that the bows of the boats are sheathed with heavy planking to withstand shocks. The great boom-logs lay fully ten inches out of water, and to novices looked an ugly barrier. But the sturdy little tug-boat backed off for a proper charge, like a war-horse in a tilt, and gathering steam, drove head on and over the obstruction in a twinkling, bravely sustaining a shock that made her timbers shiver.

Cheboygan is situated on the Lake Huron side of the Michigan peninsula, a town of 3,000 people, lying chiefly along the northern bank of the Cheboygan River, which, we have already said, is the natural outlet of the inland chain of lakes, which stretches nearly across the neck from Lake Huron to Little Traverse Bay in Lake Michigan. The trout fishing in the vicinity is very fine. Black Creek enters the Cheboygan River from Cheboygan Lake at a point a mile above the town. In this stream; in the creeks and streams that enter Duncan's Bay, three miles east; in the Okeoc, fourteen miles east; and in the streams between Cheboygan and old Mackinaw,

brook trout can be taken in great numbers. So our friend Page says in his guide book; I do not speak from experience. On Bois Blanc Island, opposite Cheboygan, are two lakes, also said to abound in trout. Resuming our journey, we enjoy its novelty as we follow the course of the river for eighteen miles or so to Mullet Lake. There are no fish in the Cheboygan, the continual drives of logs keeping them out; neither do I learn that Mullet Lake affords much sport to the angler. It is little tested, however, possibly because there is better fishing ground elsewhere. I've heard of mammoth muscalonge being caught in it.

On a calm day like ours, the approach to Mullet Lake is entrancing. Like all the waters of the larger Michigan lakes, its color, when the waves are at rest, is a translucent green, but not as deep a green as the Niagara River, which most of my readers have probably seen. The effect of this peculiar hue is most charming. Upon approaching the lake from out of the wood fringed shores of the narrow river, we see it spread before us in a great expanse, luminous and gleaming in the sun like a sheet of beryl or chrysope. In the far distance, some twelve miles or so, the opposite shore is discernible like a line of haze on the horizon. While we sail, we smoke and contemplate, or indulge in harmless pistol practice at a brace of loons quite out of range. This breaks the monotony. Nevertheless we are glad when we approach the little landing on the verge of the unbroken forest, just below the mouth of Indian River, which flows out from Burt Lake, the second of the series. Burt Lake is full of bass, pike and muscalonge, and we shall stop at friend Williston's, the only house on Indian River, five miles distant, to try the adjacent lakes and streams. A Frenchman and his wife, named Contois—very nice people indeed—occupy the only house at the landing where our boat now lies, which they keep as a hotel. It is a two-story, unpainted house, but it is new and clean, and smells of the grateful odor of the pine. No carpets cover the floor, but one don't care for carpets in summer. The cool glass of iced lager beer which is proffered is far more to one's taste and comfortable feeling when he is hot. For fall shooting I would recommend the Frenchman's house as headquarters. Wild rice grows in the lower part of Indian River, and many ducks congregate there in the latter part of September. The woods are "full" of deer and bears, for no one traverses them except the lumbermen. Moreover, Pigeon River is close by, and in the early fall, after the logs have been driven out, the grayling fishing there is unsurpassed. The fish are large and few ever angle for them.

Just here we have to exchange steamboats, for we require a vessel of lighter draught. Although much dredging and deepening of channels and driving of piles has been done to promote navigation, the shifting sands of the bottom rapidly work into bars, and a foot of depth is often all that is offered to encourage attempted progress. Our new craft has a pair of spluttering sidewheels and is manned by a steersman, who is captain and collector of fares, and an engineer, both men acting as deck and shore hands when required. She is called the "Valley Queen," and her captain owns the house up the river which friend Williston keeps. However, there is comfortable cabin accommodations on board of her for twenty such persons as have been in the habit of traveling in New York street cars, and twenty more can stow themselves on the trunks aft. Sometimes the "Valley Queen" carries barrels and boxes of freight for the use of the lumbermen's camps which tends to cramp the accommodations, and very often a score of the brawny red-shirted fellows themselves; and a very civil set they are in the main, and intelligent within.

Now, let us imagine ourselves under way. Spread out before us for a mile on either side is a grass and rush swamp, with scattering patches of wild rice inclosing small ponds of open water. On its outer edge is the forest. Nature everywhere is in its wild state. A stray eagle flaps his leisurely way overhead, and an occasional heron rises out of the marsh. Muskrats paddle along the margin of the river, and dive when sufficiently alarmed by the approaching boat. In the bow of the boat is a statue, motionless, holding a gun. It is A. B. Turner on the lookout for ducks. At intervals a single one, or possibly two or three, rise out of a pool, and making a wide detour, return and fly past far out of range. Turner hangs at them but bags no game, as it is against the law to shoot ducks in August—any kind but wood-ducks. [Mem. All killed ducks are wood-ducks; those that are not hit are mallards or teal.] The sport of loading and watching for chances occupies the time until the boat draws out of the swamp. At length the forests close in, and the river narrows to a channel three times her width, with cedars, balsam and hardwood, impinging close and sometimes arching over. Pigeons afford frequent chances for marksmanship, and Brother Turner proves his skill with credit at wing-shooting. In due time we pass the mouth of Sturgeon River, a cold and rapid stream abounding in grayling; then two log houses presently come in sight on a bluff to the left, and directly afterward the whistle shrieks as if it would blow itself loose, and we round a bend and glide up to a substantial log landing in deep water. This is Williston's house, and here we tie up for dinner. Two ladies and a lad are still-fishing for bass hard by. There is an Indian camp on the shore opposite, with dug-out canoes hauled up. Burt Lake is visible over the point of land ahead, and the whole outlook is promising for sport. Here let us rest.

I can conceive of no more central point for sport than just here at this quiet log house in the middle of the wilderness, with only three other houses within a distance of twenty miles. There is the river flowing at your door, connecting

the two large lakes, each some twelve miles long; the forest around you, and game and fish to be had by the skillful with the usual amount of painstaking. It is not luxurious pastime nor child's play to hunt large game. For instance: We are to have a bear-baiting to-night, and will go out with Williston. Williston is an educated Massachusetts gentleman of the old Northampton stock. His family are above the ordinary type of "moss-backs," as the homesteaders are called in this section. The "bar" signs are plenty; only three miles back in the bush, but a three-miles tramp at night through a tangle, when the dew is heavy and the forest dark as Erebus and Nox, is not as pleasant as a stroll "on the beach at Long Branch." Besides, we shall have to lie out all night whether we get the bear or not, as it is more preferable to wait for daylight than to tramp through the woods in the gloom, and the bear must be cut up before he is carried out to the house. So we gather up some remnants of fox carcass and other wild meat secured for the purpose, and, shouldering guns, axes and blankets, made into a pack, take a few biscuits in the pocket and sally forth. We cross the river in a boat, kick aside the dogs at the Indian camp who intercept us, and plunge into the thicket. There is a blind trail for a distance, and after that comes travail of the worst sort. In daylight the natural obstructions of fallen trees, roots, briars, interwoven branches, swinging grape-vines, mud-puddles, spring-holes and brush would be sufficiently discouraging; but now we are throttled by the vines in the darkness, tripped by the roots, grasped and scratched by the briars, and upset by the fallen trunks; forked limbs jerk off the bundles of blankets, the brush catches the trigger guards of the guns, your ax falls in the mud, your boots stick in a spring-hole, and the dew and night dampness soak to the skin. By the time you are thoroughly thumped, bruised, scratched and wet, you are prepared to put out the bait and camp. The place where the bear has made the most sign is selected, the bait is deposited, and the hunter folds his blanket about him and awaits the denouement. Secreted in a thicket of brush, he holds his gun ready and resigns himself to patience and the pleasures of hope—like the gambler's wife in the story. After hours of anxious waiting, "the clock strikes twelve." No bear! "One o'clock!" Long time he tarries; the game grows interesting. "Two o'clock!" "He cometh not," she said. "Three o'clock!" The play is for high stakes now. Drowsiness rests on the heavy eyelids. "Four o'clock." The first gray of dawn pervades the woods. The vigilant watchers shake off their somnolence and rouse themselves. Ha! the bait is gone; the bear is *non comitibus in swampis*! "Five o'clock." Tableau at the garden gate. [Hunt to be continued.]

Fish are more easily captured than bear steaks. Yesterday a large pike lay under a root in the shallow water just opposite the landing. A fringe of weeds floated around the place and a lily-pod shaded the old fellow's head from the sun. Let us drop a bait there! no matter what sort of bait. These *esocida* are verdant and not up to the tricks of masters of the angle; they will bite anything. We have a minnow and will give him that. Phew! what a rush! He has it! Presto! the fish is gone—and the bait, too, the stout line bitten off short. N—w—give him a wire snood and try him again. There, we have him! No stopping on ceremony when a pike's fast is to be broken. He's fast enough this time at any rate, and makes brave play. After all a big pike on a rod is no mean customer, despite the bad name folks give him. They are lively enough at the first, but their pluck doesn't last. That's what's the matter! Now reel him in! A big stick would afford as much play. Here he is with the two minnows in his gullet—three feet long by my pocket tape measure. Now let's take breakfast, steak or no steak. Pike is not bad eating.

I doubt if the Indian River has ever been fished with a trolling spoon. Tourists don't stop, but pass directly through. Sometimes they let a hook trail in the foam astern of the steamboat, and frequently pick up a fish, almost under the splash of the paddle wheels. I never such a favorable place for pike. The entire river, and especially the last four miles, is lined with weeds and roots, under which the fish lie in multitudes. One day we took our boat down stream to look for pigeons, hoping for shots as they flew across the river. In the boat was a cut sapling and a short line, which a lad had used for fishing in his unsophisticated way. I fastened a spoon on it, and carelessly threw it over the side. In a twinkling a pike took it. We took twenty-seven fish without an effort as we drifted down—all caught within ten feet of the boat. Some jumped a foot out of the water, and seized the hook while it dangled in the air. All were large, and one four feet long. I've often thought I would like to try the experiment there, *secundum artem*, to see how many I could catch in a single day. I verily believe the boat would swamp before it would get the load home.

Just above our place at the landing, the channel has been dredged and deepened, and the sand thrown out on either side is kept from drifting into the stream again by long rows of piles and planking. The bottom is irregular, and from the deepest holes one can take bass with a fly while standing on the bank. But Burt Lake is the place *par excellence* for these splendid fish. They grow large there. Pike and muscalonge of enormous size swim in its waters, and the Indians keep their larders abundantly supplied therefrom. They can be taken with troll or minnow along shore where the shoals break off abruptly into deep water, making a shelf under which long weeds grow, stretching from the bottom to the surface.

Forty rods from Williston's house is an Indian burying-ground where the dead are buried who fell in battle at the

Island of Mackinaw during the earlier struggles. Their friends carried the bodies a long distance that the solitude of the inner wilderness might guarantee immunity from disturbance. Yet the canal diggers lifted out the boxes with their sacrilegious shovels until the cowed remnants of the tribe who still reside in the neighborhood mustered enough of their old fire to forbid the exhumation, and compelled them to desist by threats of vengeance dire.

I would like to convey to the reader in florid word-painting some idea of the beauties of the lake scenery around me, but Virgil and all the poets after him have sung bucolics until the books are filled with the familiar theme. So I will merely say that the beaches are shelving and the shores are bold, with only a settler at intervals of many miles. On one side of Burt Lake is a small Indian village, which we pass as we enter Crooked River, a stream more crooked than its name. So sinuous is it that it doubles on itself and worms through the forest like a snake, with many a twist and turn. Progress through it is helped by poles shoved against the bank, after the fashion on the Oclawaha in Florida, only this river is more crooked than that. Deer and bears are often intercepted by the boat while swimming across, and I've no doubt but that most of the denizens of these woods have never heard a gun.

Through Crooked River into Crooked Lake: At the head of Crooked Lake we take stages for Petoskey, now seven miles distant, having completed the circuit of the round trip since the reader started with me. There is an outlet from Crooked Lake into Round Lake, and thence into Traverse Bay; and perhaps some day a contemplated improvement will be made and the channels from one to the other be deepened so that boats may pass.

A year ago the road to Petoskey, which we now travel with comparative ease, was almost impracticable. How so good a road as it now is could be made through a tamarack swamp so dense seems marvelous. It would puzzle a bear to push through the jungle that characterizes the first half mile of the journey. But the forest grows gradually more open, and the monotony of the ride is broken by a dash along the shore of Round Lake. Then the stage dives into the wilderness again, and at a distance of two miles from town strikes a frequented road, passing the Methodist camp ground, where the underbrush has been cleared out, and thence leads into Petoskey. When I drove through, scattered fires were burning in the forest. Some were so near the roadside that the heat was fervent. It was pitch dark, and the lurid light of the leaping flames and their crackle among the pines and hemlocks, with the dust of the road and the thick smoke of the burning, made the journey seem like a passage through—through—well, you can imagine what it was like. We drove so fast that we had little time for imagination. The reality was all that we could manage for the time being. We were really in danger of being cut off if a wind had sprung up. The next day the fires had spread very considerably, and for several days after the smoke of the conflagration rose in a great cloud. Then a timely rain came, quenched the blaze, cleared the atmosphere, and tourists who made the passage had only the charred and blackened rampikes to contemplate and regret.

In my next I will take the reader through the southern chain of lakes.

HALLOCK.

BRONZES AND BRONZE ORNAMENTS.—We have too long looked to France for entire supremacy in works of art. Granting to a certain degree that our models are derived from foreign sources in the execution of bronze work, our metal-lurgical skill is beginning to assert itself. Ingenious methods of casting and working metals belong exclusively to our people. They have it within their own hands to produce at cheap rates ornaments of the most beautiful and varied character. In visiting the handsome show-rooms of the Bradley & Hubbard Manufacturing Co., No. 21 and 23 Barclay street, the extreme elegance of their most extensive collection of bronzes and ornaments struck us with astonishment. Here were the choicest models reproduced in endless variety. There were plenty of objects which would strike the sportsman's eye, such as models of dogs, horses, birds, stags and many other animals. As prizes for sporting contests, a great many of these subjects would answer admirably well. The Bradley & Hubbard Manufacturing Company also make in bronze and metals those beautiful *jardeneries* which the ladies delight in. It is not only the perfection of design which is to be regarded, but the price of such beautiful objects is within the reach of all.

"FRED BEVERLY" IN THE WEST INDIES.—We have already printed three letters from this indefatigable naturalist, giving some account of his scientific explorations in Martinique, Dominica, and other West India islands, and are promised more letters soon. The information which Mr. Ober is now gathering, is in behalf of the Smithsonian Institution, and will probably cover a period of two years in all. It will be eventually published in a volume, illustrated principally from photographs, and will be a work of much value, inasmuch as it covers ground almost wholly new, and much that has never been visited. In a letter dated at Antigua last September, Mr. Ober says:

I have visited and photographed the "Boiling Lake" of Dominica, and am the only American who has seen it; have lived among the Caribs two months (the only white man in the region); have made long excursions into the mountains, with only Indian guides, in search of the "Imperial Parrot," my specimens being the first ever sent to America. That was

a rich time I had, sleeping under a hut of palm leaves in the midst of a tropical, mountain forest, shooting parrots.

Mr. Ober has already sent to the Smithsonian lists of the specimens which he has collected on each island, which was hope to obtain permission to publish soon.

In the Antiqua letter referred to above, he says:

I have just returned from Barbuda, where I had glorious sport shooting guinea fowl, hunting deer, wild pigeons, doves and plover. Plover shooting commences here after the first northwest storm after Sept. 1. Golden plover come down in swarms. Everybody owing a gun turns out. Everybody has to have a license, not (two licenses), to shoot; costs ten shillings; I had to take out one before I could collect; that is, they collected from me before I could collect the birds. This is the "Collect" they believe in. Expect to leave here in a few days to plunge into the woods again.

**ALLEGED SWINDLING SCHEME IN FLORIDA.**—A correspondent sends us some useful information in regard to schemes of bad repute, which are apparently going on in Florida. We quote the following from the Philadelphia *Evening Telegraph*:

For some time past public attention has been directed to the efforts of certain people to induce men to emigrate to Texas, Florida and elsewhere, holding out such inducements as to lead to the impression that land can be procured for little or nothing. This morning the matter was brought to the attention of his honor, the Mayor, by the reception of the following letter, which fully explains itself: "Starkie, Florida, Oct. 29.—William S. Stokley, Sir: About a week ago I arrived at this place as one of a colony from Philadelphia, to locate in this place, under the title of Flora City Colony, managed by certain parties residing in Philadelphia. We came by way of Savannah, Ga., and Baldwin to Starkie; but what was our astonishment to find that there was no such place, and no one knew of such a place. I, with the rest of our party, bought land plots at \$5 each. It was represented to us that the land was all surveyed, and that was all we would have to pay. We find, however, that we have to pay \$5 more for having it surveyed. I have been here a week, and I have not seen one article of my freight. My wife and children are suffering for the necessities of life, and we cannot get them. I trust, sir, that they will use all the power you possess to stop others from being deceived, so that they may not leave their comfortable home to come to a desert among strangers, who hate them and charge two prices for everything they have to sell. I hope, sir, you will cause this to be published in the daily papers, so that others may not come. One of the parties is now here, and will shortly return to bring others out. I hope, sir, you will prevent him.

R. LITTLE, Starkie, Florida.

There are swindlers everywhere from Maine to Texas: It behooves of course everybody to look carefully at any project. It would perhaps be well for our Florida friends to get at the bottom of this business.

**THE YELLOW FEVER IN FLORIDA.**—As there may be some needless alarm about yellow fever in Florida, we take great pleasure in publishing a communication from a distinguished physician of Jacksonville, which must dispel all fears—such cases of fever as may have appeared, were entirely confined to Fernandina, and the cool weather has dispersed all danger long ago.

**Editor Forest and Stream:**—Many ridiculous stories and statements have appeared in the public press regarding the prevalence of yellow fever in Florida. It is a fact that yellow fever existed in the city of Fernandina for several weeks; but your readers must remember that the city of Fernandina is not the whole of Florida. It is located on an island at the extreme northeastern portion of the State. With the exception of four cases, one a quarantine officer, and the others refugees, the disease has been confined to the affected city. The city of Fernandina has been rigidly quarantined by the remainder of the State, and in consequence the disease has been limited in its ravages.

Persons desirous of visiting the State need not remain away because yellow fever prevails in one little corner of it. Jacksonville and East Florida can be reached by rail without approaching within sixty miles of the affected locality; and by water from Charleston and Savannah without sighting the island upon which Fernandina is located.

During the last summer, Jacksonville has maintained its reputation of being one of the healthiest cities east of the Mississippi. Our mortality during the summer months has been very small.

Among the hotel improvements I may remark that the popular Windsor has been doubled in size, and refurnished with every luxury and convenience, and is a palatial hostelry. It is under the management of General Lewis, of Cincinnati, a gentleman who knows how to run a hotel. The old and favorite Metropolitan has changed hands, and has been cleaned and renovated from stem to stern. It is under the charge of C. H. Edwards, who will be found an attentive host. The terms are moderate, and cleanliness is the order of the day. With regard to the table, I can assure your readers that I have tested it for four months, and have found it all a gourmand or gourmet can desire.

The old and favorite steamers are on the river and a new one eighty feet long and twenty-four feet beam, named the Border City, has been placed on the route between this city and New Smyrna. From an examination of the craft I feel assured that she is staunch and sea-worthy; and last, though not least, her accommodations are comfortable. A steamer called the City of Bridgeton has been placed on the route between Savannah and Enterprise, and will make weekly trips. She is a fine vessel, and possesses excellent accommodations for a large number of passengers.

In conclusion, I may remark that settlers, tourists and sportsmen run no risk and need not hesitate to visit this State on the score of yellow fever, for it is "cabined, cribbed and confined" on a small island at the extreme northeastern portion of the State, where it will be caged until Jack Frost ends its career.

Jacksonville, Oct. 29th; 1877.

**HAYES' POLICY.**—We wish to express our most hearty approval of the President's policy. Now, do not frown; we, of course, do not refer to politics. Whatever might be our reserved opinion of the Southern policy, the Civil Service policy, or the other fruitful themes of dispute, we certainly should not be so

stupid as to obtrude our opinions through these columns. But we do unhesitatingly indorse Mr. Hayes' rule of confining the official cares of his position to their legitimate place, as was set forth in an interview with Barnum the other day. The great showman, in his role of public benefactor, called at the White House to condole with the President over the cares of his office, and, of course, to invite him to the show:

"I sympathize," said Barnum, "with anybody who holds the office of President. Of course it is a high office, and all that, but I have known every President from Jackson down, and they all got your under it, except, perhaps, Grant. How well I remember poor Polk; his hair turned gray, his eye lost its sparkle, his face became pale and his body thin. They worry themselves to death." "There is no longer to me, Mr. Barnum," answered the President. "I do not intend to grow gray in office." "But you can't help it," said the showman. "You make a mistake; you see it when it is too late, and such things trouble you. You have a troublesome question, for instance, to-day; what do you do with it? It stays in your mind and follows you into your family and into your recreation, if you take any. Your mind is at work on it at night when you don't know it, and before you are aware you will be gray-headed." "You are mistaken there, Mr. Barnum," quickly replied the President: "I do not allow my official annoyances to follow me outside of this room. I go to my family, play with my children and forget that I am President. Nearly every day when I leave this office, usually from 3 to 4, I go for a drive, but sometimes I prefer to walk. I take with me in my carriage some pleasant gentleman, who is agreeable to me, and who I know will not talk to me of public business and politics. A long drive settles my nerves, banishes the sad cases that come to me which I cannot help, and gives me an appetite for my dinner. In the evening I see many friends, socially, and this is a diversion rather than a task. I am rarely troubled with politics in the evening. Those who come, both ladies and gentlemen, are generally known to us, and they come at our invitation. I retire reasonably early and rise early, and so there is little danger of gray hairs in my case."

**THE GREAT LONDON CIRCUS.**—A circus! That is just one of those things a man never tires about. It is said that a theatre depends for its support upon a younger generation. That is the fresher element which, ever being produced, takes in with ecstasy the pleasures of the drama. True your old, habitual, play-goer, at least in America, is a *rara avis*. But a circus! There, at least, there are no strangling conventionalities. The Lord made fine horses; one sees them in all the beauty of that strength and grace, which no amount of training or handling can efface. There is exhilaration in the smell of the saw-dust, and a whiff of it must always recall the time, long ago, when the Spanish quarter, with the pillars of Hercules on it, was spent, and the whole world, the *plus ultra* of delight, was opened. There is a charming simplicity about the downright foolishness of the regular old-fashioned clown, which is worth more than all the doubly-distilled wit of to-day. See the thews and muscles of the circus men! How they stand out like whip-cords! If you have not so much brawn yourself it makes you wish you had it. Another man's intellectual powers may be depressing; you may be weighted down by somebody else's brains; but one never envies him who possesses strength and agility. The fact is that we, all of us, are inclined too much at times toward those amusements in which the mental powers are called entirely into play. We seek recreation and are plunged all the time in a brown study. It is physical enjoyment, such as can be taken in by the eyes, that we oftentimes pine for. We don't know, it is true, always, what we want to find, but we often go for relaxation to the wrong places. We defy any one to see that famous lady, Miss Dockrill, in her four horse act, without being carried away in a perfect rush of enthusiasm. Every time she floats over a barrier or clears a narrow hoop, the heart of the spectator rises and falls in unison with her. Think of seven funny men cracking off jokes in seven distinct languages! Then there are baby elephants, and all Noah's ark of animals. The Great London Circus is an event, and Gilmore's Garden never had a more attractive show than the one we have but vaguely described.

## OUR WASHINGTON LETTER.

THE CORCORAN ART GALLERY—ART AND ANGLING—STATUARY AND SPORTSMANSHIP—DOGS AND DUCK SHOOTING—SAWMON FISHERIES OF THE COLUMBIA RIVER, ETC., ETC.

[FROM OUR OWN CORRESPONDENT.]

WASHINGTON, D. C., Nov. 3, 1877.

AMONG the many rare and valuable pictures in the Corcoran Art Gallery, that magnificent building at the corner of Seventeenth street and Pennsylvania avenue, a monument to the munificent benefactions of W. W. Corcoran to this community, are a number representing the pleasures of the chase, the sports of the field and stream—all true to nature, and many of them portraying such scenes as every sportsman frequently meets. Such pictures are sure to steal over one with all the charms of a personal reminiscence. This institution, which is a conspicuous illustration of the zeal of Mr. Corcoran in cultivating a love for the beautiful, and contributing to the pleasure of his fellow man, is maintained by an endowment fund of \$900,000, yielding an annual income at present of \$62,000. Doubtless the distinguished philanthropist reaps as much pleasure in distributing his wealth as he did in acquiring it. I will not attempt a description of the gallery and its valuable pictures, about which columns might be written, but briefly refer to such pieces as are of interest to all sportsmen. First, on account of its masterly treatment and its wide reputation, may be named "The Lost Dogs," by O. Von Thoren, an animal picture equal to Landseer's in point of close adherence to nature. It is quite large, and represents two beautiful setters lost at the close of a wintry day. The active distress of one, "the wail of the lost," and the mute resignation of the other are strongly portrayed. It is full of feeling, power and nature, and is much admired by all visitors. The picture was exhibited at the Vienna Exhibition in 1873, where it elicited much praise.

The next picture to attract the sportsman's attention is one representing "A Trout Brook in the Catskills," by W. Whittridge, of Ohio, an artist who has attained a high rank and I believe now pursues his art in New York City. Its exquisite tints, the burst of sunlight and coffee-colored hue of the water make it an effective picture. It is the only specimen of the work of Mr. Whittridge in the gallery, and is highly esteemed in that institution.

Another is a characteristic American Shooting scene, entitled "Duck Shooting." It represents two sportsmen engaged in that charming sport on the Jersey flats, and it is the work of Wm. Ranney. A handsome red Irish setter has just retrieved a canvas-back, and approaching his master, sits up to deliver the fowl. The master, however, is running home a charge (for the picture was painted in 1850, before the day of breech-loaders), and his companion holds out his hand to take it from the dog, but there is an evident reluctance on the part of the latter to give it to any one but his master. Several ducks which have been shot are shown in the foreground, all true to nature. The picture is full of vigor and truth. It was in the private collection of Mr. Corcoran, and was donated to the gallery with that collection.

"The Disputed Shot," by J. M. Stanley, an artist well known on account of his famous Indian portraits, many of which, it will be remembered, were destroyed by the disastrous fire at the Smithsonian Institution some years ago. This picture illustrates a scene of Western life. It is worked up with delicate details, and is perfect in drawing, finish and color. Three hunters having returned to their cabin from the chase, have just assorted their game, consisting of a deer, number of ducks and various birds; and while two of them are apparently disputing as to whose shot brought down the deer, they are watched with grave dignity by a noble setter in the background.

A very humorous picture is that of a fat, happy-looking monk fishing in the moat beside an old castle. He is surrounded by an abundance of tackle and a huge landing net, but the only evidence of his success are three bull-frogs lying by his side. The picture is the work of L. A. G. Lousenau, and came from the Paris Exposition of 1874.

Another picture entitled "Wood Scene with Hunters," by M. Bouquet, represents a party of sportsmen who have been engaged in the chase, resting in the forest surrounded by their hounds. The incident is admirably told, and every part of the work painted with great force and clearness. Mr. MacLeod, the curator of the gallery, has a specimen of his own work on exhibition. It is a picture of the Great Falls of the Potomac, the favorite black bass fishing locality in this section. The Falls and surroundings are given with strict local truth.

There are numerous other attractive works whose merits deserve an extended notice, but which time and space forbid at present. Among them may be mentioned "On Catskill Creek," by W. B. Boggs; "Dog and Parrots," by F. Lachenwitz; "Tiger Hunt" (water color sketch), by A. L. Barge; and "Scene in the Catskills," by Paul Weber. Of course, there are many grand pictures in the gallery by renowned artists, but I have referred to such as represent sporting scenes only.

In the display of bronzes, in a large hall to the left on the first floor of the building, are over one hundred pieces, comprising the collection of the late Antoine Louis Barye, of Paris, a famous sculptor and professor of animal drawing in the Jardin des Plantes, Paris, a position he held at the time of his death, in June, 1875, and one in which he gained an astonishing knowledge of the forms and habits, quiescent and ferocious, of the various animals there. He was perhaps over fond of showing the ferocious instincts of the brute creation, but their gentler moods are quite as successfully represented. Among the many attractive pieces in this collection are the following: Two Arab Horsemen Killing a Lion; An African Horseman Surprised by a Serpent; An Indian Mounted upon an Elephant Crushing a Tiger; Ape Mounted upon a Gnu; An Erect Bear; Two Young Bears; Theseus Slaying the Minotaur; Theseus Slaying the Centaur; A Wolf Seizing a Stag by the Throat; Lion Devouring a Hind; Lion and Serpent; Two Young Lions; Tiger Surprising an Antelope; Jaguar Devouring a Crocodile; Ocelot Carrying off a Heron; A Deer Dragged to Earth by Two Scotch Hounds; A Group of Deer; A Group of Rabbits; Pheasant; Virginia Deer; Wolf Caught in a Trap; A Frightened Hare; A Panther; Stag of Java; Couching Fawn; Tortoise; A Bear Flying from Dogs; Huntsman in Costume of Louis XV.; A Bear Overthrown by Bulldogs; Greyhound and Hare; Deer, Hind and Fawn; and many other beautiful pieces representing wild and domestic animals, birds and serpents, the whole forming a most interesting collection.

In the Hall of Antique Sculpture, among many grand works of art, is a statue of Diana, the Goddess of Hunting, from the original marble in the Louvre. The goddess is represented as snatching from Hercules the miraculous deer with golden horns and brazen feet, which he had chased for a year. The sculptor is unknown, but it is supposed to be the work of the same artist as the Apollo Belvidere, the famous statue discovered at Capo d'Anzo early in the sixteenth century, and placed by Michael Angelo in the Belvidere Gallery, Rome. This latter statue Byron describes as

"The lord of the unerring bow,  
The god of life and poesy an light—  
The sun in human limbs arrayed, and brow  
All radiant from his triumph in the fight."

The original of the Diana above mentioned is supposed to

have been made during the fourth epoch of Greek art, which extended from the death of Alexander to the conquest of Greece by the Romans, B. C., 140.

#### SALMON FISHERIES ON THE COLUMBIA RIVER.

The bill recently introduced in the Senate by Mr. Mitchell, of Oregon, authorizing the Secretary of War to grant permission to the proprietors of salmon fisheries, now located on Three Tree Point military reservation, on the Columbia River, in Washington Territory, to remain in said reservation until the same shall be required for Government purposes, is to prevent the removal of two large canning establishments now located on that reservation, which is not used for any purpose whatever by the military authorities. The proprietors of these establishments, when they located there, did not know that it was a military reservation. They purchased the right to conduct salmon fisheries there from a person who claimed to have pre-empted the land, and expended about \$40,000 in the erection of buildings and for the necessary machinery used in canning establishments, and then learned, for the first time, that they were occupying a military reservation. The matter was investigated, but the books of the Land Office did not show that it was such reservation. The War Department records did, however, and the Secretary of War ordered them to remove. Subsequently all the facts were brought to his attention and he revoked the order, issuing, in lieu thereof, one allowing the parties to remain there for one year, which will not expire until after the close of the next fishing season. One of the proprietors was recently before the Senate Committee on Military affairs when the bill above mentioned was considered by that committee, and explained at length all the facts connected with their occupancy of the reservation. There are about thirty salmon canning establishments on the Columbia River, and the two at Three Tree Point are among the largest.

The markets of this city, I notice, are already quite plentifully supplied with game, but, as the season advances and the weather becomes colder, the supply will be more abundant. There is an extensive business here in ducks and other aquatic fowls from November to March, the Potomac, from Alexandria to Point Lookout, a distance of a hundred miles, being a favorite feeding locality for them, and thousands are killed every winter for market. Mr. James H. Skidmore, probably the oldest and one of the most reliable dealers in game and fish, not only does a thriving business here, but ships large supplies North. Upon his stand in the Centre Market a few days ago, I noticed wild turkeys, shot in Virginia, which were retailing at \$1.50 and \$2 each. Partridges, \$3 per dozen;uffed grouse, \$1.25 a pair; woodcock, 50 cents each; snipe, 25 cents each; plover, 37 cents each; canvas-back ducks, \$2 a pair; red heads, \$1.50; black heads and widgeon, 75 cents a pair.

Mr. Henry Herbner has on exhibition at his restaurant on King street, in Alexandria, Va., a most remarkable specimen of fish. It was caught in an oyster dredge near Piney Point, and still remains alive, eating freely of crackers and bread. The fish is shaped somewhat like a turtle and has a hard shell. It has eyes in the shell, and its under side is furnished with a number of arms or claws, terminating like those of the ordinary crab, while the rear portion of the stomach is covered with jointed scales like the common cockroach. It has a tail like a turtle's, and about a foot long. Altogether it is a very singular fish, and old fishermen say that they never saw anything like it.

R. F. B.

#### GAME PROTECTION.

INFRINGEMENTS OF THE GAME LAWS WEST AND EAST.—In a capital article which appeared in the *Chicago Field*, entitled "On and After," violations of the law in selling game are fully discussed. Chicago is exactly the centre which draws to itself the game of the West, while New York is the point of general distribution. Our contemporary deserves the thanks of all sportsmen for his efforts in this laudable direction. With the *Chicago Field* at one end of the line and the *FOREST AND STREAM* and *ROD AND GUN* at the other, there may be good reason to suppose that before long exposing game for sale out of season, and in violation of the laws, will be prevented. Let Brother Rowe stop shipments from Chicago; we will see to it that whatever escapes his vigilance there will receive an attention when it reaches New York.

THE GREENWOOD LAKE ASSOCIATION.—At a meeting of the Greenwood Lake Sportsmen's Club, held in this city, Nov. 7th, Messrs. Olcott, Cooke, Olcott, Jr., Millsbaugh, Verman being present, with McDowell, chairman—it was resolved that,

The executive committee and officers of the Greenwood Lake Sportsmen's Club be, and hereby are, instructed to transfer, set over and deliver to the Greenwood Lake Association, all the property and effects whatsoever of the Greenwood Lake Sportsmen's Association, upon the Association agreeing to recognize as their members all members of the Greenwood Lake Sportsmen's Club.

At a meeting of the newly-formed Greenwood Lake Association trustees, Messrs. Olcott, Cooke, Roe and Verman, it was resolved, on motion of Mr. Cooke, that the condition of the above proposition be accepted; and it was also resolved to allow the delinquent members of the former club thirty days in which to pay their initiation fees and monthly dues. A meeting is to be held in Brooklyn, at the residence of Dr. C. Olcott, Dec. 10th, for the purpose of presenting the forin of certificate of stock, and to take measures for the erection of a club house at the lake which will be built as soon as the snow goes off the ground in the spring. The officers elected were:

Dr. C. Olcott, Pres.; A. S. Roe, Vice-Pres.; H. C. Cooke, Treas.; Wm. O. McDowell, Sec.

PROTECTION IN VERMONT.—The Vermont Association for the Preservation of Fish and Game held an interesting and very successful meeting at Rutland, Nov. 6. The rolls of the association show the names of more than 100 members, among them such men as Chief Justice Pierpont, Senator Edmunds, Dr. Goldsmith, Gov. Stewart, Col. Cannon, Hon. Jo. D. Hatch, Gen. Foster, Lieut.-Gov. Proctor, Hon. M. G. Everts, Gen. W. Y. Ripley, Gen. E. H. Ripley, Col. Merrill, Col. Colburn, Hon. Charles Barrett, S. B. Pettengill, editor of the *Rutland Herald and Globe*, in which journal the society has a valuable and influential auxiliary; William Rix, Esq., C. N. Davenport, Esq., Dr. Edmunds, President Buckingham, E. J. Phelps, Esq., Gen. Grout, Col. John W. Newton, Rev. Henry Fairbanks, Hon. N. T. Sprague, Dr. Guild and others. After the banquet (advocates of protection are always most eloquent on that theme just after having been well fed on roast venison, ducks, prairie chicken, partridge, etc.) reports were read, which show that several rivers and ponds have been stocked with black bass and other fishes, and an increase of game in many parts of the State is adduced as a result of the society's efforts. Among the papers read one by Judge Everts on the importation of the Messina quail, of which importation, it will be remembered, a full account was given in *FOREST AND STREAM* of Aug. 2d and 9th. The 100 birds having hatched their young, and having increased as it is estimated by over 500, started southward Sept. 1, since which time they have not been heard of south of Eagle Bridge, N. Y. The birds lived principally on grasshoppers and other insects. Judge Everts was directed by the society to correspond with Senator Edmunds, relative to the importation on an extensive scale by the Government or the States of these insects as an antidote for the grasshopper scourge. It was also voted by the society to recommend to the legislature an amendment making the open season for partridge and woodcock from Sept. 1 to Dec. 1. The officers elected were: President, Hon. M. S. Colburn, Manchester. Vice Presidents, George F. Edmunds, Burlington; J. W. Newton, St. Albans; George F. Gale, Brattleboro; Carrol S. Pitkin, Montpelier. Secretary, S. B. Pettengill.

THE RICHMOND ASSOCIATION.—We regret that we cannot chronicle an equally successful meeting of the Richmond Game and Fish Protective Association, which was to have convened during the late State Fair. There seems to be no lack of individual and local interest in protection among the sportsmen of the Old Dominion, if we may judge from frequent communication to the *Richmond Whig*, as well as from private letters received by ourselves. Whether the failures of the past cast a depression upon the late proposed meeting, or whether from other causes equally potent, the convention proved a failure. Among the papers which were to have been read was a carefully prepared address of Dr. Ellzey, of the Agricultural College at Blacksburg, which we hope at a future date to lay before our readers.

NEW YORK.—*Niagara Falls*, Nov. 10.—I wish to make some corrections in my letter of Nov. 1, as some persons have evidently misconstrued my meaning. What I charge, or meant to charge, was that the club, J. P.'s and policemen, took no measures to prevent or punish the violation of the game law, and the three persons in particular (whom I believe to belong to the club) in violating it by shooting quail out of season. I did not claim that all of the club, J. P.'s and police, etc., violated the game laws, but that they took no pains to prevent it. It has made quite a stir among them, and I have no doubt that it will do some good in the future.

C. S. RICE.

HOW LONG IS THE ARM OF THE LAW?—A correspondent writes us of deer hounding in the northern wilds of this State. We are glad to expose the names of these men and sincerely trust that the law may be made to reach them:

I was at Long Lake and Newcomb; just came from there. They are paying no attention to the law in regard to hounding deer. You can hear them all around, and even see the watchers on the public roads; where runways cross it. Not more than one in ten do they get, but a great many get their legs broken on the hedges, some become sickly, and die after running so hard and going into ice cold water. I can give you names of some that are hounding deer. They are Harrison Hall, V. Hall and Hank Parker, of Newcomb, N. Y. They say that the law does not come back to Newcomb and Long Lake. They say hundreds were crust hunted last winter and killed. Game constables are appointed through there, but are not sworn in because they are guides and like to hunt. Yours truly, JAMES E. ROBINSON.

Johnsbury, Nov. 6th.

KILLING DEER IN AN UNSPORTSMANLIKE MANNER IN WASHINGTON TERRITORY.—The following correspondence, with an extract from the Port Townsend *Argus*, explains itself. Deer are being ruthlessly slaughtered in and about Olympia. Go ahead, gentlemen, kill every thing right and left in an unsportsmanlike way, and in time there will be no game in the neighborhood! We decry such wholesale butchery, which is of the most potbunting description.

OLYMPIA, W. T., Oct. 25, 1877.

#### EDITOR FOREST AND STREAM:

I send you an extract from the Port Townsend *Argus*, which tells its own story. The deer were killed by driving them into the water with hounds, and shooting them from the shore while swimming for their lives. At this rate of destruction, it is only a question of very short time how long the deer will last in Washington Territory. On all the islands in Puget sound deer are found in great numbers, as their natural enemies, the cougar and lynx are not inhabitants of these islands they increase rapidly, and afford excellent sport for the still hunter.

Very truly yours,

Mr. G. M. Haller informs us that he, with Judge Lewis and others, who have been out on a hunting excursion for nearly two weeks, enjoyed the trip very much, although the rain for two days, in the early part of the tour, made it rather unpleasant. The party visited several islands in the course of the trip, and killed in all 25 deer.—*Argus*.

—Elkton, Md., has a new game club, which has been formed for the purpose of prosecuting any persons found on Elk River violating the ducking laws of the State.

The Cayuga County Lake and Forest Association deposited in Owasco Lake last spring, at an expense of over sixty dollars, 125,000 salmon or lake trout fry. On Saturday evening last, thirteen fishing boats were seen at one time out upon the lake with torches and spears, killing trout upon their spawning beds.—*Syracuse Standard*, Nov. 2.

#### SPLIT BAMBOO RODS.

To our customers and the public:—In reply to the damaging reports which have been circulated respecting the quality of our split bamboo rods, by "dealers" who are unable to compete with us at our reduced prices, we have issued a circular which we shall be pleased to mail to any address, proving the falsity of their assertions.

CONROY, BISSETT & MALLESON,  
Manufacturers, 65 Fulton Street, N. Y.

#### The Kennel.

TO CORRESPONDENTS.—Those desiring us to prescribe for their dogs will please take note of and describe the following points in each animal:

1. Age. 2. Food and medicine given. 3. Appearance of the eye; of the coat; of the tongue and lips. 4. Any changes in the appearance of the body, as bloating, drawing in of the flanks, etc. 5. Breathing, the number of respirations per minute, and whether labored or not. 6. Condition of the bowels and secretions of the kidneys, color, etc. 7. Appetite; regular, variable, etc. 8. Temperature of the body as indicated by the bulb of the thermometer when placed between the body and the foreleg. 9. Give position of kennel and surroundings, outlook, contiguity to other buildings, and the uses of the latter. Also give any peculiarities of temperament, movements, etc., that may be noticed; signs of suffering, etc.

#### THE TENNESSEE FIELD TRIALS.

NASHVILLE, Nov. 11, 1877.

AFTER three days of gloomy, drizzling, depressing weather, with a northeast wind which chilled the very marrow in one's bones, and made us apprehensive of a failure of the field trials to come off to-morrow, the clerk of the weather, however, relented, and yesterday sent us a bracing, spanking breeze out of the north, which soon swept away the lowering clouds and gave us a glorious sunset, the harbinger of fine weather, for our week's sport, in which our native pointers and setters are to contest with each other and settle the question of superiority with their foreign canine rivals, for whom their owners arrogantly claim the exclusive title to "blue blood." The Maxwell, where I am most comfortably lodged, is crowded with sportsmen from every quarter, each anxious for the triumph of his own kennel or section, and the excitement is already up to fever heat, more particularly on the issue between what a writer and importer called the American mongrels and the foreign blue bloods. I have had a most gratifying reception from Mr. V. L. Kirkman, the President of the Tennessee State Sportsman's Association, and Mr. Prechitt, the Secretary. These gentlemen will kindly afford me every facility and assistance for making you what I trust you will find to be a perfect report of the pending trial. They have, through the courtesy of General Hardin, secured several thousand acres of a magnificent country, amply stocked with birds, which have been vigilantly guarded by a mounted keeper in the employ of the association, and ample arrangements have been made for the transportation to the field of the sportsmen and their dogs.

I have devoted the whole of the morning to the inspection of the different kennels; among others visited was that of Mr. Gilling's, who has established himself here permanently. I should not wonder if Mr. Gilling's had the winning dog in Mr. George Colburn's magnificent dog Sank, by Foreman Taylor's famous one-eyed Sank out of Colburn's Kate, I believe. Young Sank is in superb condition, and will run high in the betting. His breaker is regretting the absence of Colburn's old Dash, to run in the trials with young Sank; the twain would certainly make the handsomest brace in the trial, and, as a brace, would be hard to beat.

Colburn's Bob, by Colburn's Dash out of Mullen's Belle, a superb fellow, is also here, but he unfortunately met with an accident, which will prevent his running in the trials. There are two other New York dogs entered by Dr. Fleet Spier, of Brooklyn, black, white and tan, both very handsome, with heads like Raymond's Pride of the Border.

As you go to press on Tuesday you can only publish the result of the first day, which I will send you by telegraph. I send the printed list of entries, corrected by Mr. Prechitt, the Secretary of the Association.

F. G. S.

ENTRIES FOR ANNUAL FIELD TRIALS SPORTSMAN'S ASSOCIATION, NASHVILLE, TENN.—The following are the entries for the puppy stakes, under eighteen months:

W. W. Tucker, of Arkansas, enters Kitten and Champ; Dr. Fleet Spier, of Brooklyn, St. Elmo; John Davidson of Monroe, Mich., Affton; Chas. Turner, of St. Louis, Berley and Biddy; J. H. Dew, of Columbia, Floss; P. H. Bryson, of Memphis, Gladstone; D. Bryson, of Memphis, King; Geo. W. Campbell, of Carter's Creek, Maury County, Tenn., Ida; J. K. Hughes, of Franklin, Tenn., Skip; Geo. W. Campbell, of Maury County, Floss. Entries for the Champion stakes, for all ages, prize \$500, to be run Tuesday: W. A. Wheatley, of Memphis, Floss and Countess; Van L. Kirkman, of Nashville, Tom, Jr.; Geo. W. Campbell, of Maury County, Buck, Jr., and Jo; L. R. Morris, of Guernsey County, Ohio, Mag; Geo. C. Colburn, of New York, Sank; Alfred Jenkins, of Baltimore, Hals; L. H. Smith, of Strathroy, Canada, Clip; D. C. Sanburn, of Baltimore, Mich., Nellie, winner of the Hampton, Ia., champion field trials; Dr. Fleet Spier, of Brooklyn, St. Elmo; Patrick Henry, of Clarksville, Pride of the South; P. H. Bryson, of Memphis, Whip and Gladstone; Dr. Fleet Spier, of

Brooklyn, Spiero; D. Bryson, of Memphis, King; John Davidson, of Monroe, Mich.; Chester; C. B. Whitford, of St. Louis, Thornton and Berkley.

Entries for the Dupont Powder Company Stakes for braces, to be run on Wednesday, prize \$250: W. A. Wheatley, of Brooklyn, Flint and Countess; Dr. Speir, of Brooklyn, St. Elmo and Spiero; Van L. Kirkman, of Nashville, Tom, Jr., and Kate; Geo. W. Campbell, of Maury County, Buck, Jr., and Jo; L. B. Morris, of Guernsey County, Ohio, Mag and Dash; Geo. O. Colburn, of New York, Sam and Hala; L. H. Smith, of Strathroy, Canada, Pride of the South and Chip; P. H. Bryson, of Memphis, Whip and Gladstone; C. B. Whitford, of St. Louis, Thoroane and Berkley.

St. Louis Kennel Stake, for puppies under 12 months old, silver cup valued at \$50, to be run Wednesday: John Davidson, of Monroe, Mich.; Tyne; W. W. Tucker, of Arkansas, Champ; J. K. Hughes, of Franklin, Tenn., Skip; J. H. Dow, of Columbia, Ill.

Nashville, Monday, Nov. 12.—Our correspondent in Nashville telegraphs us as follows: The success of the meeting is beyond expectation. There are so many fine dogs to see that as yet I have no chance of writing in full. Of the puppies entered for the puppy stake so far, Mr. P. R. Bryson's pup, Gladstone, by Lewellen's Dan out of Petrel, is the only one which has made a full score. The performances of the other puppies entered, however, have been very good. The hospitalities of Generals Hardin and Jackson at Bellmeade are without stint or limit. The weather is delightful, the country magnificent, and birds abundant.

## DOGS FOR TURKEY, GROUSE AND SQUIRREL SHOOTING.

### EDITOR FOREST AND STREAM:

It is not uncommon to hear theoretical and cockney sportsmen sneer at squirrel shooting as boyish and beneath their dignity, and yet if they would give the sport a trial in the only way it should be pursued—that is, with a grooved rifle and a single ball—it is probable they would find it much more difficult than they fancy. To bring down a squirrel, shot through the head, from the topmost branch of a tall tree, is to most men quite as difficult as to stop the quick flying quail in mid-air. If some of the gentlemen who make such stunning scores at Conlin's would give the sport a trial, perchance they would find it quite as fascinating as the pursuit of any feathered game. I know I found it so in my youth, when, with keener eye and steadier nerve than I can boast of now, I could, with the old-fashioned long rifle of former days, carrying 180 to the pound, bring down a squirrel from the top of the highest trees in the Blue Ridge almost at every pop.

In your issue of October 25 you recommend a correspondent, D. C. B., of Keosauqua, to hunt squirrels with a small cur dog. Now, I hope you will permit a constant reader, who admires your paper as by far the ablest published in this country on field sports and those cognate branches of natural science, without which no man can claim to be a thorough and accomplished sportsman, to dissent from your advice to D. C. B., and here are my reasons: In the first place I object to cur dogs for any purpose on general principles, and had I the legislative power I would tax them all out of existence, for through their racialities and villainies the nobler and more useful canine races are brought into disrepute.

Again, I most positively deny that curs, small or large, are the best for hunting squirrels. To establish such heresy you must first prove an impossibility—that your cur is superior to the thoroughbred in nose, stamina, intelligence and other desirable qualities. I have frequently shot both squirrels and grouse over small curs belonging to mountaineers in Virginia, and a few of these I admit were excellent, but the best of them would not compare with a pair of clever wire-haired Scotch terriers, belonging to my friend, De Witt Kent, of Maryland. The hospitable mansion of the late Governor Kent, on the western branch of the Patuxent, in Prince George county, was in the season much frequented by hunting and fishing parties, who would sometimes devote a day to the squirrels which abounded in the heavy timber on the river bottom. When this was the case these terriers would know it quite as well as the sportsmen, probably because the pointers were always put on the chain on these occasions. They would joyously scurry away to the woods, even before we left the doorestep, and by the time we reached the outer gate, their vociferous yelps would announce the fact that a squirrel was treed; but this was not all; these clever little dogs were never guilty of lying, as squirrel dogs so often are, and the intelligence with which they would turn the game to the shooter was marvelous, and if the squirrel ever reached his hole, as he always aims to do, they would abandon the tree immediately, and seek elsewhere for a fresh trail.

Once owned a dog, presented to me by the late Commander Ned Byrne of the navy, so famous for his social talents, and you will be surprised to learn that this, the very best squirrel dog I ever saw, was an immense greyhound! One would imagine that, with his feeble-seeming powers, a greyhound was the last dog in the world for such a purpose, but in this breed of hounds the visual powers and phenomenal speed more than compensate for a defective nose.

Mounted in air on his still-like legs, the greyhound commands a greater horizon than smaller dogs. Nothing within its range escapes his hawk-like vision, and his lightning speed compels the squirrel to take to the nearest tree, without making for his den as he invariably does when chased by a small and necessarily slow dog.

Again, a dog running by the scent will frequently take a solid trail and stop at a tree long after a squirrel has left it. With such a dog squirrel hunting is more vexatious than amusing. To the same inquirer you recommend the clumber spaniel for turkey and ruffed grouse shooting. Now though a noble, rare, and exceedingly valuable and useful race, the clumber of all the spaniel family is probably the best fitted for hunting either of these birds, simply because he hunts a peculiarity for which he was chiefly valued by the Duke of Newcastle, who originated the breed at Clumber castle. Both the turkey and the ruffed grouse are essentially forest birds. The latter particularly is usually to be found on the roughest ground and in the densest cover; and, for hunting both birds, a cocker that throws his tongue freely is incomparably the best dog. He takes the trail of either bird and runs upon it, giving tongue the while, like a beagle on the track of a hare, until he flushes his game. The turkeys

will generally scatter in every direction, when the hunter makes a blund, and from its concealment slaughters the birds in detail as they come in obedience to his call. The grouse usually take to a tree, and, perching low, will remain, as it were, stupefied by the yelping of the eager cockers until several are shot in succession. And here let me conclude with the remark that in Maryland and Virginia, shooting grouse perched on trees is held to be perfectly legitimate, as in nine cases out of ten the very best shot can bag them in no other way.

F. G. S.

ROBINSON'S JACK.—This famous red Irish setter, so well known among sportsmen throughout the country, has again come into the possession of his former owner, Mr. Walter Humphrey, of Newark, N. J. Jack, now eleven years old, is to be made as comfortable as possible for the rest of his life. Our readers will learn with pleasure that he is to be photographed, like other celebrities. The following is his pedigree:

| JACK.                |                      |
|----------------------|----------------------|
| Palmer's Belle.      | Putnam's Dan.        |
| F. Palmer's Belle.   | Putnam's Nell.       |
| D. Paul Mead's Dash. | D. Paul Mead's Dash. |

THE PHILADELPHIA BEACH SHOW, which is given under the patronage of the best gentlemen in that city, bids fair to be a grand success. Up to date several hundred entries have been made, a large proportion being sporting dogs. The prizes are of solid silver in each class, and are very liberal. Besides the regular prizes numerous special prizes have been offered, which will be competed for without extra charge. Every possible care will be taken of all dogs, competent men being in attendance day and night for that purpose. The judges are gentlemen of the highest position, and thoroughly conversant with the animals to be under their judging.

THE ENGLISH HUNTING FIELD.—The London Field, in its issue of October 27, gives its customary list, at the opening of the season, of the hounds, their masters, the huntsmen, the whips, the locality of the kennels, and the days of the meets. The whole statistics of the various hunting establishments, in England, Ireland and Wales, are presented. Starting with Her Majesty's noble staghounds of forty couples, of which the Earl of Hardwick is master, which meets at Windsor and Maidenhead on Tuesdays and Fridays, Frank Goodall being huntsman, Eldrup, Hewson and Bartlett whips, the category closes with a dozen couples of beagles, which are the delight of Trinity College, Cambridge. The total of the dogs used in the hunts amounts to something like 20,000. Of course, the absolute number of dogs must be larger, as for purposes of breeding, and to make up for replenishing the kennels, a stock in hand must be ready to draw from. We should suppose, then, that England, Ireland and Wales are ready to turn out into the hunting field, of staghounds, foxhounds, harriers and beagles, fully 40,000 fine-bred animals. The famous Pytchley and Quorn establishments are about up to their former number in dogs. The Pytchley, of which Earl Spencer is master, hunts with 65 couples, and the Quorn, under Mr. John Coupland's guidance, has 58 couples. It is generally conceded that the Pytchley has the largest number of hounds in England, though the Meath hunt, Ireland, of which Mr. W. Newcome Waller is master, has 70 couples.

THE FINISHING SCHOOL FOR DOGS.—Mr. E. S. Wannaker, who is one of the most competent and painstaking dog-breakers in America, is now at Fort Defiance, Virginia, about seven miles from Staunton, where he is stopping at the private house of a personal friend of the editor of this paper, to whom a proper letter of introduction was given. His object in going to Virginia is to select the best ground for breaking his dogs on game; and as quail, woodcock and ruffed grouse can be found in abundance within twelve miles of his location his field is not restricted. We were induced to take a personal interest in Mr. Wannaker's enterprise because we wish to encourage one who is so conscientious to his patrons and devoted to his business as to leave no method untried, however severe or taxing to his sense of comfort or self-indulgence. We have no doubt but that his school for dogs is the very best, and that he will so prove it, when he returns his graduates to their owners, that he will have gained their fullest confidence and that of the dog-loving and dog-retaining fraternity of sportsmen. If he fails to satisfy we shall make the fact known. As far as we know, Mr. Wannaker is the only dog-breaker in this country who takes his pupils into game countries for practical instruction and a varied course of study. We are not aware that his method is followed in Europe. However, it matters not whether it is his own and original with him provided it proves its own value to those who wish to have their dogs well broken, both in house and field.

Besides his own dogs, Mr. Wannaker takes with him the dogs Leaf and Branch, both red Irish setters, by Plunkett out of Stella; Promise, by Pride of the Border out of one of Mr. Dudley Olcott's bitches; Mr. Jno. F. Waters' imported orange and white setter, Ben Smith; Mr. E. A. Herzberg's Patii, blue Belton, by Pride of the Border out of Jessie; and Mr. F. H. Hall's red and white setter, Bess.

GUN SIV.—In the Chicago Field a Mr. Oyer finds some objections to the statement made in the "Sportsman's Gazetteer" as to the age when pointers or setters may become gun shy. Exactly on the same page of our Western contemporary there is a capital letter from Mr. S. H. Boughton, a good authority, who writes: "Mr. B. (Mr. Burgess) thinks the idea of old trained dogs becoming gun shy a ridiculous one. I do not quite agree with him here, for I have known at least one old

dog to become gun shy." [The italics are our own.] Mr. Boughton's opinion is worth much more than Mr. Dyers'. In fact Mr. Oyer is a very meddling busybody. In time, doubtless, Oyer will gain wisdom and learn that, besides himself, Hyers, this question as to the age when dogs may become gun shy is indicated. So much for Oyer. If Oyer will read the FOREST AND STREAM AND ROD AND GUN he will find scattered through its pages many interesting facts in regard to the time when dogs may become gun shy.

GOOD STOCK.—Mr. M. Von Culin, of Delaware City, has written us that his field trial setter bitch, True (Prince-Dora), was bred to Carlowitz on the 12th ult. The same gentleman's Colleen has whelped nine puppies to Rufus II, all blood red. Mr. Von Culin will exhibit at the coming Philadelphia show Carlowitz, Laverack setter; Queen and True, field trial setter bitches; Jacques, red Irish setter dog, and the red Irish setter bitches, Colleen, Jane, Clytie and Moll III.

THE SAN FRANCISCO DOG SHOW.—Our correspondent writes us under date of Nov. 4th: "I visited the bench show last evening and was surprised to notice the number of superb dogs on exhibition: You know that although we are paying the greatest attention to our setters and pointers, still as we hunt deer nearer to home than you do in the East, we are devoting a great deal of our time to breeding dogs for the chase. In stag-hounds and grey-hounds, the show was superb. The Gordon setters were a fine lot. I really do not think that New York could show such a variety of hounds. In a later letter I will give you fuller details."

D. S. L.

BILL.—P. S. Hackett, of the Kendrick House, Wareham, Mass., has sold his six-months' old white pup Bill to Mr. E. M. Coles, of Middleboro, for fifty dollars. Bill is out of Mr. Hackett's white Gip, and is sired by his celebrated white dog Sam, both being of pure English stock. Gip has now six dog sucklings, which are five weeks old, and strange to say she seems to grow fat, and is looking sleek and sound.

L.

## DOG POISONING.

SAN ANTONIO, TEXAS, NOV. 1, 1877.

### EDITOR FOREST AND STREAM:

I write to condemn a certain class of criminals who laugh at the law, and dog poisoners. Last night some miscreant poisoned my English setter, Rob Roy, a fine specimen, which I brought from the North, and one of the best workers I ever saw. A number of valuable dogs have been poisoned here within a few months. That there should be some law protecting property of this kind there can be no doubt about. The State makes dogs property by taxation; why should not the State protect them by law? I have several horses, and not one of them cost me as much as my dog. I would much rather have lost one of my horses—all are good ones; not Texas ponies—than this dog. We have no protection against such rascality. If a man steals a horse in Texas he gets from one to fifteen years in the penitentiary. Yet he can destroy a dog which may have cost from three to five hundred dollars, and the owner has to swallow his grief and loss. I believe the true sportsmen of the country should take this matter in hand and see that the proper influence be brought to bear upon our legislative bodies so that proper laws might be enacted. I hope you will agitate this matter through the columns of your journal, so that our people will awake to the importance of legal advice, and strive to punish those who kill our dogs.

H. I. BINGHAM.

[If a dog is taxed it is certainly property and is acknowledged as such. We refer our Texan correspondent to former numbers of our journal, where the matter was fully treated.—Ed.]

## DOG VS. PORCUPINE.

### EDITOR FOREST AND STREAM:

Here is an incident of Rangeley Lake twelve years ago. We were three in number—two humans, one canine—escaped on a small island in Moosemenagantic, near to a long stretch of dead water at lower end of a brook emptying into the lake. Plenty of ducks, plenty of fish, both lake and brook. The boys laughed at us like veritable lunatics all night, and the water was as clear as best glass. My mate on the day in question was gone away for an early morning fish in the dug-out. The dog and myself were as'leep in the tent under four big pine trees. I was awakened by what I took to be heavy rain striking on the canvas, but which proved to be bits of bark from the stem of the tree nearest the tent door. The dog was excited and looking up into the air. So I looked up too, and to my half opened eyes appeared an immense animal with fierce face coming down toward us. I was not long in giving the stranger the contents of my revolver, which failing to bring him to earth, I gave him one barrel of the duck gun, with the effect of minging a dog and a large male porcupine in an indiscriminate row in the clearing in front of the tent.

For now the day over quail time, however, and if ever a man was abused for a two weeks' time, that man was myself by my mate, because the shorter barbed quills were scattered in all directions, managing to insert themselves in our feet and legs at any odd moment, when for luxury the wading boots were thrown aside and "the stockings which our mothers gave us at birth" were used instead.

I never look on this porcupine's skull, now acting as pen-rack on my desk, without laughing at the wild ideas which came into my mind when first I saw him alive coming down that old pine tree with his quills well forward. Peace to his soul.

SAWBORES.

A CARD.—C. S. Westcott, of Philadelphia, whose name has been published as one of the judges at the coming Philadelphia Dog Show, requests us to publish the following card:

PHILA., Nov. 13, 1877.

### EDITOR FOREST AND STREAM:

I would ask you to publish in your estimable paper that, owing to the basis upon which the coming Philadelphia local show is to be held, I am obliged to resign all positions. I was led to accept, believing that the interest at issue would not admit of my name being used as a patron or judge of the same.

Very respectfully yours,

C. S. WESTCOTT.

Physicians diagnose ailments sometimes by very trifling signs. So with character; it is indicated by little moral straws. You may also detect the good, shrewd sense of people by noticing little facts about their household. If you see people use the new toilet soap, B. T. Babbitt's Toilet Soap, you may pronounce them to be persons of the greatest discernment. Why? Because this soap has in it every requisite of absolute excellence—purity, innocuousness, delicacy of flavor, and a feeling on the skin like the breath of a zephyr.—[Ad.]

Too SMART BY HALF.—A police inspector on being informed that a restaurateur in his bailiwick was serving game out of season, visits the restaurant in muff and orders dinner. "Waiter," says he, "can you give me a salami of partridge?"

"Satisfying, sir," replies the waiter, promptly, and yells to the cook, "Partridge for one."

The inspector finishes his dinner leisurely and then says to the waiter, "Ask the boss to step this way a minute."

"What for?"

"I wish to notify him to appear in court tomorrow and answer for selling partridge out of season."

"O, I guess it ain't worth while bothering him about that."

"Do as I tell you. I am the Police Inspector, and have secured the necessary evidence against him."

"O, I spotted you and guessed what you were after. It wasn't partridge you had."

Police Inspector (uneasily)—What was it, then?

Waiter (cheerfully)—Crown.

Tiffany & Co., Silversmiths, Jewelers, and Importers, have always a large stock of silver articles for prizes for shooting, yachting, racing and other sports, and on request they prepare special designs for similar purposes. Their Timing Watches are guaranteed for accuracy, and are now very generally used for sporting and scientific requirements. TIFFANY & CO. are also the agents in America for Messrs. PATEK, PHILIPPE & Co., of Geneva, of whose celebrated watches they have a full line. Their stock of Diamonds and other Precious Stones, General Jewelry, Artistic Bronzes and Pottery, Electro-Plate and Sterling Silverware for Household use, fine Stationery and Bric-a-brac, is the largest in the world, and the public are invited to visit their establishment without feeling the slightest obligation to purchase. Union Square, New York.

Flies tied to order from any pattern.

## NEW YORK SHOOTING COAT.

A stylish, handsome Coat. First-class in every particular. Pleasant to wear, durable, and in the end the cheapest.

### MADE OF BROWN VELVETEEN.

Pockets and lining made to take out, so that it may be worn for early fall and winter shooting. (Horace Smith, Esq., says: "It is my idea of a shooting coat. I have worn them for several years, and would have none other.") Price for Coat, \$25; Vest, \$6.50. Also the best brown corduroy pants at \$10 per pair. I make only the one grade, as the cheapest goods do not turn brats and will not give satisfaction.

Also, in addition to the above, I am making a Waterproof Canvas Suit, cut same style as the Velveteen; goods, not stiff and hard, but soft and pleasant to wear; guaranteed to turn water. Sportsmen who have seen it say it is The Best Vest, Coat, \$6.50. For full suit, \$14.00. I also make the Sleeveless Coat; Vest with sleeves if desired. Rules for measurement and samples sent upon application.

F. L. SHELDON, Rahway, N. J.

For Sale by Dealers in GUNS and SPORTSMEN'S SUPPLIES.

**Buffalo Pony Planer**  
NEARLY ONE THOUSAND IN USE.  
Buffalo Pony Planer. Will cut self and, pay expense of running in 3 days. Price from \$50 and upwards, each.

**SMALL STEAM ENGINES.**  
With Copper Boiler, to drive light Lathes, Scroll Saws, etc. Are all sizes from 1-hp up to 2-horse power; either plain castings, partly finished, or complete, ready for use.  
The "Scientific American" of June 30, 1895, says of the above, in an extended Editorial, introducing our manufacture to the public: "It can turn wingwheels, churns, washing machines, or ice cream freezers, run coffee mills, pump water through a house, actuate foot lathes, scroll saws or light boring machinery, run knitting or sewing machines, turn a grindstone or emery wheel, work venting or hand thrashing machine cutters, meat or feed choppers, or sausage machines, drive small blowers for pneumatic dispatch tubes in a building, or for a blacksmith's forge, or compress air or work an air pump on a small scale in a laboratory. These are a few of the purposes to which it can be applied."  
Also Engines and Boilers capable of propelling 15 to 25 horses. The boats have Keel, Steam, with rudder and tiller, row locks and oars. Those wishing a pleasure boat will find

**Buffalo Excelsior Pony Planer and Matcher.**  
Patented March 30, 1895.  
Best of its kind in use.  
Price, complete, \$295.  
Also Planing Machine Knives, which are recommended as superior and extra in quality.

ling boats from 18 to 28 feet long, 4 1/2 to 5 1/2 feet beam, with draft of water stern and rudder post of oak, pine planking, copper fastened throughout, fitted with all round the boat, lockers and coal bunkers, and have two coats of paint. These the safest and fastest, as they can be made to attain a speed of from 6 to 16 miles per hour.  
They are adapted to great variety of uses, such as Excursion, Shooting, Fishing or Pic-Nic Parties, for travelers, voyagers, boatmen and tourists, and especially owing to their light draft of

water for exploring expeditions and surveying parties. The Engine and Boiler can be easily detached from the boat, and is then available for Agricultural, Mechanical, Commercial or Domestic requirements or for the use of Amateurs, when power is needed for running light machinery.  
Price of 20-foot boat, complete, \$425.00  
Price of Engine and Boiler, without boat, including driving pulley, \$75.00

Illustrated Catalogue containing One Hundred Scroll Work Designs mailed to any address free on receipt of Stamp.

## SHONINGER ORGANS.

[PRONOUNCED UNANIMOUSLY AS THE

## Best Instruments.

Their comparative excellence is recognized by the Judges in their Report, from which the following is an extract:

"The B. SHONINGER ORGAN CO.'S exhibit as the best Instruments at a price rendering them possible to a large class of purchasers, having a combination of Reeds and Bells, producing novel and pleasing effects, containing many desirable improvements, will stand longer in dry or damp climate, less liable to get out of order, all the boards being made three-ply put together so it is impossible for them to either shrink, swell or split." THE ONLY ORGANS AWARDED THIS RANK.

This Medal and Award was granted after the most severe competition of the best makers, before one of the most competent juries ever assembled. New styles and prices just issued, which are in accordance with our rule, the BEST ORGANS for the least money.

We are prepared to appoint a few new Agents. Illustrated Catalogues mailed, postpaid, upon application to

**B. SHONINGER ORGAN CO.,**  
97 to 123 Chestnut Street,  
NEW HAVEN, CONN.

SHELLS LOADED FOR PARTRIDGE, QUAIL & WOODcock and \$10.00, \$4 per hundred, at MAISTERS, 125 Nassau street, New York, and 60 Court street, Brooklyn.

## Gunpowder.

## Warren Powder Mills,

MANUFACTURERS OF

BLASTING AND MINING, SHIPPING AND  
SPORTING GUNPOWDER.

**SPORTING BRANDS**—Bucka, Continental, "Border Rifle," Snap-Shot, and Warren Sporting Cannon and Musket, U.S. Standard. The above can be had of the dealers, or at wholesale at the office, 27 Doane street, Boston, Mass., and of the agents, JOHN P. LOVELL & SONS, corner of Washington, Cornhill and Brattle street, Boston, Mass. Jy19

THE

## HAZARD POWDER CO.

MANUFACTURERS OF

## GUNPOWDER.

**Hazard's "Electric Powder."**

No. 1 (fine) to 6 (coarse). Unsurpassed in point of strength and cleanliness. Packed in square canisters of 1 lb. only.

**Hazard's "American Sporting."**

No. 1 (fine) to 3 (coarse). In 1 lb. canisters and 6 1/4 lb. kegs. A fine grain, quick and clean for upland prairie shooting. Well adapted to shot-guns.

**Hazard's "Duck Shooting."**

No. 1 (fine) to 5 (coarse). In 1 and 5 lb. canisters and 6 1/4 and 12 1/2 lb. kegs. Burns slowly and very clean, shooting remarkably close and with great penetration. For field, forest or water shooting, it ranks any other brand, and it is equally serviceable for muzzle or breech-loaders.

**Hazard's "Kentucky Rifle."**

FFF, FFG, and "Sea Shooting" FG, in kegs of 25, 12 1/2, and 6 1/4 lbs, and cans of 5 lbs. FFG is also packed in 1 and 3 1/2 lb. canisters. Burns strong and moist. The FFG and FFG are favorite brands for ordinary sporting, and the "Sea Shooting" FG is the standard Rifle powder of the country.

**Superior Mining and Blasting Powder.**  
GOVERNMENT CANNON & MUSKET POWDER. ALSO, SPECIAL GRADES FOR EXPORT OF ANY REQUIRED GRAIN OR PROOF, MANUFACTURED TO ORDER.

The above can be had of dealers, or of the Company's Agents in every prominent city, or wholesale at our office,

88 WALL STREET, NEW YORK.

THE

## New Dittmar Powder.

THE CHAMPION POWDER OF THE WORLD

For all off-hand shooting at short and long ranges. Unsurpassed for Cleanliness. Pleasant to shoot on account of little recoil and report. Desirable for hunting on account of little or no smoke. Unequaled for rapid fire, as it does not foul and heat up the barrel as black powder. Great accuracy, penetration and good pattern. Safer than black powder. Address

JAMES BRADY, Manager and Proprietor.

## Sportsmen's Goods.

THE

## "Boston Shooting Suit"

Is manufactured only by

G. W. SIMMONS &amp; SON,

BOSTON.

## Flexible, Waterproof, Tan-Color, Duck.

Each article—coat, trousers, vest and hat—have the name and manufacturer's address stamped upon it, and no suit is genuine without it bears this imprint.

The suit can be sent, securely packed, by mail to any part of the United States or Canada on receipt of \$1.25 above the price of the suit.

We make no discount except to the trade. We make but one quality, and that is the VERY BEST. The price of the suit complete is \$13.

The suit consists of coat, trousers, vest and choice of either cap with havelock, or hat.

The material is of the best quality of duck, waterproofed by a patent process. The color is that known as "dead grass shade."

The seams and pocket corners are copper riveted and nothing is neglected to make the whole suit complete in every way.

This is what one of our best sportsmen says of it, writing from camp: "Miserable, drenching rain, pouring down in a perfect deluge, as if a second flood had come upon the earth, two portages to cross, and a swamp between them; that was the prospect before we reached our camping ground. Such a swamp, too; almost impassable, for where the ground was firm was an almost impenetrable thicket of thorns and what not, that looked as if it would tear you to pieces. Well, we got to our camp, and I must confess I was agreeably surprised on my arrival. Although I had been nearly eight hours under incessant rain, laboring and striving along yet I found myself comparatively dry, and my clothes without a tear. For the benefit of our brother sportsmen, let me advise one of Messrs. Simmons' (of Boston, Mass.) Waterproof Suits. Oh! what a relief it was to find one's tobacco was dry, and that one could light a pipe; that you could laugh at your miserable friend, who stood shivering and shaking as if he had the palsy; and then, next morning, oh! what fun it was to see him mending his clothes, while I had not a tear to complain of. Ventilation, also, that great bugbear of waterproof suits, is legislated for in the most ingenious manner. No sportsman should fail to supply himself with a suit which is at once cheap, practical, and will last an almost indefinite time."

Our New Overcoat—The  
"Plevna,"

Water-proof, Millieu-roof and Moth-proof, is attracting great attention. It is made and sold only at Oakhall, Boston. The price is \$13.

It is a long overcoat made to wear to cover, or when driving or walking in stormy weather. It is perfectly waterproof, thoroughly ventilated, and just the garment that every sporting man should have.

## Our Leather Jackets and Vests

are the great wind protectors. They are made from soft, pliable black leather, flannel lined, and sell at \$9 and \$7.

Our Flexible Tan-Colored  
Waterproof Leather Coats  
and Breeches

are considered the finest things ever made. They sell at \$22 and \$15.

An illustrated circular, containing full description of each garment, with sample of the material from which made, will be sent free on application.

Address

**G. W. SIMMONS & SON,**  
OAK HALL, BOSTON, MASS.

## Sportsmen's Goods.

Attention, Sportsmen!

Each Loader adapted to 10 and 12 gauge metal or paper shells of any length, each shell being accurately charged and wadded complete in one operation. Amount of charge readily adjusted. Highly indorsed by sportsmen and the press. Having perfected arrangements for manufacturing in large lots, we have reduced the price to \$45. Manufactured only by CAMP & WISE, Stoughton, Dane County, Wis. All orders for sample loaders must contain remittance.

## Fur, Fin &amp; Feather

CONTAINS THE

GAME LAWS of all the States and the Canadian Provinces and a list of Hunting and Fishing Grounds.

Besides, a Vast Fund of VALUABLE INFORMATION FOR ALL WHO EITHER SHOOT OR FISH.

It tells you everything you want to know about Hunting and Fishing, Where to go to get there, What Kind of Game and Fish you will find, What Kind of Shooting and Fishing Tackle to Use, Ammunition, Bait, &c., and is indispensable to all who use either Gun or Rod; it is in fact, a complete HUNTING AND FISHING DIRECTORY, and no matter how much or how little recreation you take in the woods or along the streams, you will find *Fur, Fin, and Feather* worth many times its cost to you.

Each number consists of 176 to 192 large octavo pages, and in addition to the foregoing contains numerous interesting sketches of Camp-Life and Sporting Adventure that renders the work entertaining and instructive reading for every household. Not an objectionable word appears in its pages.

*Fur, Fin, and Feather* is published every two months at \$3 a year; single copies, 50 cents, can be had of all News Agents, Gun Stores, Fishing Tackle Dealers, &c., or mailed, postpaid, on receipt of price. Can be had at this office.

Specimen copies, containing all the Game Laws as now in force, 25 cents, can be had only of CHAS. SUDAM, Publisher,  
149 Chambers Street, N. Y.

## Sportsmen's Routes.

## THE "FISHING LINE."

Brook Trout, Grayling and

Black Bass Fisheries

OF NORTHERN MICHIGAN, VIA

Grand Rapids and Indiana Railroad.

(MacKinnon, Grand Rapids & Cincinnati Short Line.) Sportsmen who have caught a fish or trolled a spoon in the waters of the Grand Traverse Region will come again without solicitation. All other lovers of the Rod are invited to try these waters, wherein the fish named above, as also Muscalunge, Pike and Pickerel, abound.

In no other streams east of the Rocky Mountains is the famous American Grayling found in such numbers.

Brook Trout Season opens May 1st.

Grayling Season opens June 1st.

The sportsman can readily send trophies of his skill to his friends or "Club" at home, as ice for packing fish can be had at many points.

Take your family with you. The scenery of the North Woods and lakes is very beautiful. The air is pure, dry, and bracing. The climate peculiarly beneficial to those suffering with hay fever and asthma.

The Hotel Accommodations, while plain, are, as a rule, good, far surpassing the average in countries new enough to afford the finest of fishing.

On and after July 1st, Round Trip Excursion Tickets sold to Points in Grand Traverse Region, and attractive train facilities offered to tourists and sportsmen; also, on and after July 1st, Mackinaw and Lake Superior Excursion Tickets.

Dogs, Guns, and Fishing Tackle Carried Free at owner's risk.

Camp Cars for Fishing Parties and Families at low rates.

It is our aim to make sportsmen feel "at home" on this route. For Tourists' Guide, containing full information as to Hotels, Boats, Guides, &c., and accurate rates of the Fishing Grounds, send to Forest and Stream office, or address

J. H. PAGE, G. P. & T. A., Grand Rapids, Mich.

A. HOPPE, Eastern Passenger Agent,  
116 Market Street, Philadelphia.

## NEW YORK AND PHILADELPHIA NEW LINE

FOR TRENTON AND PHILADELPHIA.

COMMENCING OCTOBER 10, 1877.

fishes and other entertainments.

## WHAT PRAIRIE OIL IS BEING USED FOR.

Mr. KENWARD PHILIP, late Dramatic Editor *Brooklyn Eagle*, Brooklyn, N. Y., was unable to walk with-  
out the aid of crutches, owing to a severe attack of Rheumatism. After the third application of PRAIRIE  
Oil the crutches were thrown aside, he having no further use for them.

Says the Proprietor of Niblo's Garden, New York: "PRAIRIE Oil gave me relief from inflammatory  
rheumatism after first application; and after the third I had no further use for my cane."

PRIOR RORKE, Esq., ex-Building Inspector, DeKalb avenue and Fort Greene Place, Brooklyn, says: "For  
acute or inflammatory rheumatism it is a wonderful remedy; has been in use in my family for over a year."

M. C. EDEY, Esq., the well-known chemist, 319 Court St. et, Brooklyn, manufacturer of Edey's Carbolic  
Troches, etc., says: "I find PRAIRIE Oil to be a most wonderful preparation in cases of rheumatism, hav-  
ing seen it tested in a case of years' standing. The patient obtained relief at once, and was ultimately  
cured."

Mr. JOHN H. SNEDICKER, of Telfair & Snediker, oil merchants, 105 John street, New York, was cured of  
Pleurisy by the use of PRAIRIE Oil.

Mr. G. PADDON, tobacco merchant, 992 Fulton street, Brooklyn, lost the use of his right leg by Sciatica,  
got relief at once after first application of PRAIRIE Oil. This gentleman had become so depressed by his  
affliction that he had given up all hopes of recovery.

CAPT. JOSEPH LA FIURA, Merchant Court, near Remsen street, Brooklyn, was cured of a stiff joint, of  
years standing, after a few applications of PRAIRIE Oil.

Mr. BERTSON, publisher, 16 Beckman street, New York, says: "I find PRAIRIE Oil to be infallible in  
many serious complaints."

PRICE FIFTY CENTS AND ONE DOLLAR PER BOTTLE.

Ask your Druggist for it.

## TO SPORTSMEN IN GENERAL!

Headquarters Bohemian Glass Works,  
214 PEARL STREET, NEW YORK.MAKE THE FEATHERS FLY WITHOUT KILLING THE BIRD—SOMETHING MUCH  
NEEDED.

The Bohemian Glass Works having made a specialty of the manufacture of Glass Balls for Trap Shoot-  
ing for the past year, and having facilities for manufacturing cheaper and better than other establishments,  
have secured the service of that well-known Sportsman,

## IRA A. PAINE,

to take entire charge of the production of his new patent Feather Filled Ball, which we hold the exclusive  
right to make and sell.

In offering this new ball to the public it will require very little introduction, as in no instance where it  
has been exhibited has it failed to take the place of all others, and is to-day the only perfect substitute for  
a bird in use.

Every ball is weighed and examined, then packed with the greatest care, in barrels of 300 or boxes of  
500. Send for price list. We intend offering special inducements to the trade.

Capt. Bogardus' Patent Glass Ball Trap  
and Rough Balls.

These Traps and Balls patented by Bogardus and used by him many  
thousand times, proves them to be just what is wanted by all

SPORTSMEN'S CLUBS AND AMATEURS.

THE PATENT ROUGH BALL—The only Ball that will break sure  
when hit by shot. Use none but the best. Every ball marked. Patented  
April 19, 1877; Traps, March 13, 1877.

## ROD & GUN

THE AMERICAN SPORTSMAN'S JOURNAL.

Terms, Four Dollars a Year.  
Ten Cents a Copy.

NEW YORK, THURSDAY, NOVEMBER 22, 1877.

Volume 9.—No. 16.  
[No. 111 Fulton St., N. Y.]

For Forest and Stream and Rod and Gun.

### THE TWO NAMELESS SONG-BIRDS OF LABRADOR.\*

BY thine unfrequented shore,  
Silent, savage Labrador,  
Welcome to the stranger's ear,  
Come those bird-notes, soft and clear!  
When the dawning skies are red,  
When the evening's shades are spread,  
Singing ever, sweet and strong,  
Swells the silver tide of song.

Haply ne'er in Southern skies  
Rise your tuneful melodies;  
Nameless minstrels, thanks we pay  
For each merry roundelay.  
Sure no other note of bird  
In this wilderness is heard;  
Forest, mountain-side and plain  
Echo to no sweeter strain.

When the Winter reigns supreme  
O'er Arctic waste and stream,  
When the rippled river's breast  
Chills in adamantine rest,  
When the slanting snows and sleet  
On these forest regions beat,  
Wither, little minstrel friend,  
Doth your far migration tend?

Doth some sunnier nook of earth  
Claim you as its place of birth?  
Did some spicy grove of palm  
Shield you cradled nest from harm?  
If so, haste on frightened wing  
To those realms of endless Spring,  
For white Winter, weird and drear,  
Soon, tempestuous, will be here.

ISAAC McLELLAN.

For Forest and Stream and Rod and Gun.

### A Fortnight in the Nova Scotian Backwoods.

A FORTNIGHT seems but a brief space, yet much may be done and seen in that time. Some time ago, on my first arrival from England, I had the good fortune to join an expedition sent to report upon the state of the timber on the Admiralty Reserves in the western part of the province, and I was introduced for the first time to the pleasures of a forest life in a snug little camp, pitched in a charming nook beside the limpid waters of the ever-winding Roseway, a short distance to the northward of the secluded village of Shelburne, on our rock-bound Atlantic coast. It would be useless for me to dilate upon the feelings of one, who fresh from the cultivated vales of Old England, finds himself suddenly placed in the midst of the "forest primeval," with no sound of civilization to mar the sweet stillness which reigns amid these Western wilds; and especially upon those of a naturalist, who loves to look upon nature in her pristine garb; to see the land untouched, and the trees and shrubs in every stage of life and decay, just as they have lived and died through successive ages; to listen to the unknown sounds and cries proceeding from animals and birds, and participate in the many other events hourly taking place as he journeys on through those trackless solitudes; for it may be truly said that his cup of pleasure is filled to overflowing, and every moment of his time occupied in marking and studying the changing scenes which at every step burst fresh and enchantingly upon his wondering view.

It was on a fine summer's day, toward the close of the month of August, a date which will ever remain stamped on memory's pleasant page, that, accompanied by two worthy representatives of Her Majesty's forces, naval and military, I was ushered into the camp of which I have spoken. I stood upon the bank of a rippling stream, and the first object that caught the eye was the stalwart form of the camp steward, wielding an axe with such power and effect as to make the huge log he was splitting for the night's fire shiver under the strokes, and cause the surrounding forest to ring with their echoes; while near a fire, burning briskly between two granite rocks, stood

the form of a veritable Indian, reclining at indolent ease over the burning brands, above which hung the stock-pot from which the steam was puffing, sending around a goodly smell, which made the appetite sharpen as we thought of the eatables within. And then the camp itself—a rough affair it looked. Two slender poles, some ten feet or so apart, placed upright, a cross pole lashed to them a few feet above the ground, then with their butts resting on this cross pole and sloping back to the ground, were, laid other poles and branches of trees, ferns, etc., strewed all over the whole, forming a roof, which, although not waterproof, helped to keep off the falling dew at night. The sides were filled in with twigs and brushwood, while the floor of this primitive domicile was covered with a thick layer of spruce branches, the smaller sprays on top, to render the couch more comfortable, and then the occupant had to spread his blanket, and make himself as much at ease as circumstances would permit. So we commenced our forest life.

From Roseway River camp we journeyed to the northward, and camped again on a small point of land which jutted out into a large lake called "Long Island Lake," and a prettier spot could scarce be conceived. Before us lay the lake, whose mirror-like surface, scarce ruffled by the breeze, was dotted over with small islands, clothed with spruce and pine; while the evening sun, hot and powerful, reflected their shadows far down into the depths below; and as the shades of evening drew around, and the orb of day sank in majestic splendor behind the dark mass of forest to the westward, the camp fire began to cast a ruddy gleam of light upon the surrounding objects. The fog, now rising from the lake, caused a chilly feeling to creep over us, and more wood heaped upon the burning brands caused the sparks to fly up like miniature rockets in space, while many flames poured out from our pile of bulky logs, until bursting up in one grand sheet of blazing light, it dazzled with lurid glare the neighboring forest and our company all seated around the seething mass busily commencing the evening meal.

From this camp we one day made an excursion to the eastward, in the neighborhood of Jordan River, and found the whole district to be densely wooded with hemlock, spruce and pine. Indeed, of these species of conifers the forest in the vicinity of Shelburne appears to be almost wholly composed, and it is not until you arrive some fifteen miles up the country, that groves of maple and oak are seen. The country around Shelburne bears evidence of the ravages of fire several years ago, the present growth of timber being but small.

An island of an acre or two in extent stands about the centre of Long Island Lake, and is known as "Indian Island," from the fact that in years gone by, the Indians, who had a stationary camp above this lake, buried their dead here. And surely no fitter resting place could have been found for those children of Nature, than here beneath the sombre shade of pine and spruce to take their last long sleep in the full hope of awaking in the happy, yet visionary, hunting grounds they suppose to be in a brighter and better world beyond the sky. It would appear that the Indians have almost entirely left this part of the province, for only two or three live in the district, one of whom, Peter Paul, accompanied our party the whole journey, and proved himself as generous, noble hearted a fellow as ever smoked the calumet of peace. To the absence of Indians may no doubt be attributed, in a great measure, the large number of bears, and the presence of beaver in the vicinity of the granite hills midway across the country, called by some "The Blue Mountains;" but more of these presently. From this camping ground we journeyed along to the district of Sugar Loaf Hill, a fine grove of hard woods, birch, beech, oak and maple. It was on the further side of this hill that we bade adieu for a while to civilization. Embarking in a rather frail boat upon a lake, we pulled, not without sundry misgivings as to the probable termination of the voyage, for some low marshy ground on its northern shore, and happily succeeded in reaching the mouth of a small river, up which we had to go; but we had not gone very far before we found that our bark must be lightened, and all jumped out and pushed her up the shallows until we came to a large open savannah of considerable size, on which grew luxuriant grass. Few trees were to be seen about here, and those of a very stunted growth, the most common being the alder. Leaving our boats about midway through the plains we shouldered our packs, which were far too heavy, and made for the north-west end of it,

where we entered the thick forest again. Peter Paul having called a halt, addressed us in a very fatherly manner, to the effect that we had better look to our weapons, for as he said, "You don't know what be about where we are going." Having complied with his request we started afresh, and after some pretty bad traveling arrived about sundown at a small lake at the southern base of the granite plateau. Here we found an old log hut, which had been erected some time back by lumberers, and made it our home for two or three days, while we surveyed the country around. This lake from the quantity of small, flat stones around its margin, was called Whetstone Lake. The southern shores of this lake are clothed with a heavy growth of timber, which appears to have escaped the extensive fire that raged over the whole extent of the Blue Mountain range some years ago. The timber is composed of hemlock, spruce, maple and birch, with an underwood of withe-rod; and near the water an abundance of fern of two species, the larger being the well-known *Ornunda regalis*.

We may here remark in passing, that our Provincial maps are at fault in regard to the route we took, for not a lake or river is marked upon any of them in that quarter, whereas the country abounds with lakes and streams, some of good size. We traveled as near as we could northwest from Shelburne, but owing to the swamps and lakes we had to deviate at intervals. The land from the district of Long Island Lake is very level, and from what I could judge, is capable, when cleared, of extensive cultivation, particularly that portion in which is comprised the open savannah I have mentioned.

Our first excursion from the camp at Whetstone Lake led to the rocky slope of the Blue Mountains, which lay in full view before us, and on reaching the elevated ground one of the Indians sighted a bear which was quietly ambling along among the blue berry bushes, regaling himself on the ripe and luscious fruit. It was at once decided to stalk him true highland fashion, and off we set. The Indians arriving within range first sent a bullet through one of his feet, as we afterwards found. Turning round, the fellow made right at C—and myself, standing together some forty yards below. On he came with a growling noise, and when close to us showed a fine array of teeth, which we would have preferred viewing after his decease. There was nothing for it, however, but to stand our ground when "crack" went my friend's ponderous Lancaster, and with it went the massive conical ball which caused poor bruin to change his course, for with a bound he swerved to the right and was lost in a thicket of birch and alder. Proceeding cautiously along, we found him at last stretched out in a little hollow—and a huge beast he was, measuring from tip to tip seven feet, two inches. We must here mention a curious fact which we consider worthy of note. On running hurriedly from boulder to boulder we slipped and fell through a hole, with the knee-cap against a rock. The knee instantly swelled up and gave great pain, and we could barely drag along, when one of the Indians said if rubbed with bear fat it would soon be right again. When skinning the animal he cut off a piece, and we rubbed the part well, and, singular enough, in a quarter of an hour the swelling subsided almost as quickly as it had risen, and we were enabled to walk back to camp. The Indians have a very ready way of transporting bear meat. Cutting it up in small pieces they fold up the bear skin neatly with the pieces within, and tie the whole with bands of withe-rod (*Viburnum*); and with the same bands secure it across their shoulders as a pack, leaving the arms free for action. Bears were numerous at this spot, and were no doubt attracted by the vast quantities of ripe berries, particularly the huckleberry and blueberry (*Gajlussachia resinosa*) and (*Vaccinium canadense*), the former in great abundance. The trees and shrubs which clothe the sides of this rocky range are principally dwarf birch (*Betula nigra*) and *B. papyracea*, alder (*Alnus viridis*), interspersed with spruce (*Abies alba* and *rubra*), and dead pine (*Pinis strobus*). Under stones in Whetstone Lake I found several small leeches (*Hirudo*), one of which was of a whitish color. The larvae of a caddis fly were abundantly composed of pieces of weed and granite sand. We noticed that the bird droppings, which were upon almost every boulder on this range, were of a dark blue color, caused no doubt by their feeding at this season almost wholly upon the berries of the blueberry and huckleberry. The shores of Whetstone Lake were covered with a beautiful granite sand, nearly white.

As we are now in the most famous district in the province

\* Some salmon-fishing friends of the writer, as recorded by Genio C. Scott in his book on fishing, were constantly serenaded by two little, unknown, bright plumaged birds that haunted the woods around their camp.

for bears, perhaps it will be well to make a few remarks upon the natural history of the black bear. The bear comes out of his winter's den as soon as the snow disappears, generally about the end of April. The bear dens by himself. The she bear cubs about the first week in February, and the young are at first about the size of a common squirrel (*Sciurus hudsonius*). They obtain nourishment from the mother until about the latter end of June, and den with her through the next winter, remaining with her till two years old, and leave her for good when she leaves her den the second spring after birth. Bears are fat when they leave their dens in spring, but soon get poor, finding but little food at that time of year. It is at this time that they are apt to commit forages upon the flocks of the back settlers. The animals are known to sit and watch at the falls of streams for fish passing up in the spring. Their principal food, however, consists of the wild fruits of the forest and ants, hornets, wasps and bees, whose nests they invade for the purpose of securing the larvae, wax or honey within. They care nothing for the stings of the infuriated hornets and wasps, but the cubs cry out when stung, but nevertheless keep fast hold of the comb. Cubs will not fight with the mother when she attacks any one, but run up trees. Rutting time is in June, when the he bears are very savage, sometimes going in gangs of twenty or more, and when they come near a she bear they commence fighting among themselves furiously, making the most hideous roarings all the time, and if one gets killed in the fray the rest fall upon and eat him. They fight by first rising on their hind legs, and, rushing at each other, hugging, biting and scratching, endeavoring to rip their antagonists' stomachs open with their hind claws. Bears shed their coats about July. They stalk young moose by creeping upon them, and when close to make a great spring. Having killed the moose, they skin him just as clean as a man would, and begin to cut the chest first, tearing out the paunch, which they throw away. They dislike wet weather, and take shelter where they can keep dry under rocks, etc., and other places. When the old bears go into dens in the fall they take plenty of dead leaves and ferns and make a good bed of them, and the she bear makes no further provision at cubbing time. They always return, if alive, to the same den each fall, but if a porcupine takes possession while they are away in summer, and leaves droppings about, the bear will not return to that den again. A large sized bear will weigh over six hundred pounds, and give one hundred pounds of grease, for which one shilling sterling per pound is given at Shelburne, while at Halifax a wine bottleful sells for four shillings. The most of the bear is excellent eating, tasting something like mutton. It is best boiled to render it tender, and then fried with pieces of fat. The tongue is very similar to a calf's tongue when boiled. The Indians cure bear meat by cutting it up into long strips and placing it on a framework of poles, lighting a fire underneath so as to dry it in the smoke, which process takes about two days, and if kept dry afterwards in a proper place will keep for a year or more. They never make use of the inside portions of the animal—viz: heart, liver, etc. When they cook fresh meat they cut it into small pieces and fry it. The meat when partially smoked we found much better boiled than fried—frying making it too hard. The bones of the bear are salted down and used to put into soup. The gall of the bear the Indians use for sprains and wounds.

The Indians appear to be a very superstitious race of beings, and the most trivial events cause anxiety. For instance, one night the light of our fire attracted a little Acadian owl (*Strix acadica*), which perched on a branch close by, making a curious noise. One of the Indians at once predicted that bad luck would attend our expedition, and begged us to level a gun at the unfortunate bird, whose death alone, he believed, could cast away the spell that rested upon us.

One day we started with Peter Paul in a westerly direction from the camp, and after travelling about two miles through thick forests and swamps, we arrived on the borders of a good sized lake, with an outlet at its western end. On walking round we came upon a large beaver house, situated on the lake edge, where the water was deep. The house appeared as if two cart-loads of faggots had been thrown down in a heap and flattened above. Having no implements to enable us to take it asunder, we were obliged to leave it as it was. Going still further down the lake side we arrived at the outlet, which we found dammed across by the beavers. It was constructed of sticks and mud, overgrown with grass and weeds, the sticks laid over each other in a line of lace-work, almost entirely stopping the escape of the lake water down the brook. There was an older dam below this one, about fifteen yards lower down the brook. The smaller alders, poplars, and other trees near the dam were cut short off near the ground. This lake on its west side is muddy, with a vigorous growth of rushes, sedges, etc. An island of about half an acre, covered with spruce and pine, divided from the south shore by a narrow passage, has upon its eastern side a very large beaver house upon the shore, extending into the water. The house, or rather stack of sticks, is very large, built of larger sticks than usual. In this large pile there must be several cart-loads of sticks and small logs, from the small twig up to pieces four inches in diameter. Some pieces are several feet in length, while others are only three or four inches long. The beaver pups early in spring, having two cubs, but they are sometimes known to have young in August. When the cubs are two years old they pair and go off to another place. Beaver skins sell about Shelburne now for four shillings sterling per pound, while some years ago they sold for eighteen shillings per pound. A good skin will weigh four pounds.

About Whetstone Lake the robin (*Turdus migratorius*) was very common, flocking together in large numbers at sundown on the shore, picking up insect food. The hermit thrush (*T. palasi*), well named so, as the shades of evening drew around, to its plaintive notes; and the spotted snake (*Colester sirtalis*) was fond of sunning itself on the granite boulders by the lake side, about mid-day. These boulders had been carried up from the lake to their present position by the action of the ice, for the course they had traveled was clearly perceptible in the deep channel which led from each of them to the bed of the lake.

After three days spent in this locality, we made a move to the northwest, but had not proceeded far before some of our party shot another bear, and we had to call a halt in order to skin him. We had now arrived on the upper ridge of the granite plateau, from which we had a magnificent view of the country around for many miles on every side, and a wild and curious scene it was. All around us lay a perfect wilderness of granite boulders, among which rose a dense growth of the blueberry and huckleberry, and interspersed with thickets of a species of dwarf spruce, birch and alder. The Labrador tree (*Ledum caudatum*) and a species of *Myrica* were also abundant. Small lakes were seen in every direction, and the shrill cry of the loon marked the breeding place of that shy

and solitary bird. Our camp here was an exceedingly primitive one—a few small poles stuck against the side of an overhanging boulder, and covered with brushwood, was all that gave us shelter; but the day's toil sufficed to send us into a sound sleep, which was only broken by the sharp frost of the early morning. On awaking early, I went out to survey the scene, which was indeed lovely in the extreme. The sun was just rising, illuminating the eastern sky with glowing colors; a flock of wax wings (*Amphisp. cedrorum*) sat preening their feathers on the bleached branches of a blasted pine hard by, in company with a few migratory thrushes, while a keen north-west wind was blowing, bracing up the nerves, and the whole country round became gradually lit up to the life of another day.

We now traveled still upon the elevated table land, passing here and there through some terribly swampy ground covered with moss, which sank at every step, letting us up to the knees. We were freighted with our heavy packs, and above all the heavy green bear skins, and the work told upon all. Sometimes our route lay over spots where, in addition to the mossy swamps, fallen spruce and pine lay beneath, with their sharp-pointed spikes of branches sticking up, on which we occasionally got a painful reminder; but after all our trouble, about noon we gained the summit of a high point of upland, on which rested a huge granite boulder split into two pieces, under which was a large rill of delicious water. We gave this the name of "Split-Rock Well." Leaving this place, we arrived a little before sundown near a stream which joined two large lakes. The stream was deep and about twenty feet wide, and presenting a good site, we camped here. At dusk, three of us started for the upper lake to see the beavers, which Peter Paul told us he had seen some time back when in company with an old Indian he had visited it. We came cautiously upon its banks, and lay down looking and listening for the animals. In a short time, at some distance, we could see in the twilight ripple marks on the surface, and presently a head or two moving about swimming in the direction of the opposite shore. We watched them carefully and observed that the beaver coasted along shore, engaged now and then in looking for food, just as we have often seen the muskrat do in a pond. After watching them for some time, we heard on our right, where Peter Paul had gone, a loud flap on the water, just as if a paddle had been struck on the lake, and all signs of beaver vanished at once. This, we considered, came from a sentinel beaver, who, having heard Paul coming in the direction of their headquarters, had sounded this token of alarm. Although we waited for some time after this, not a beaver could be seen.

The next day we traveled also along the table-land in a northwesterly direction, passing over much the same kind of land, the spruce woods getting larger. I chased a porcupine for about a hundred yards, when he took to a spruce tree some twenty feet high and was killed. I noticed that the Indians shaved the porcupine of his quills before carrying him. The process is as follows: Taking a sharp knife they shave from the tip of tail to head, and are extremely careful not to get any of the small quills in their hands, as the puncture is very painful. The old woman's tale of a porcupine throwing its quill at a person chasing it is untrue; the truth of the matter being that if a stick be presented to it, or any one attempts to handle it, it immediately strikes the offender with its tail, driving the smaller quills with such force as even to stick them firmly into a piece of wood. The flesh of the porcupine is delicious, tender and sweet, the tail when fried nicely being the choicest morsel. We camped this night in dense woods by the side of a stream, and having exhausted all our provisions, began to feel somewhat alarmed that if we did not reach the settlement on the west or Weymouth Coast before long we should fare badly. I may say that we fully expected to have struck some marks of civilization at noon of the first day, according to our reckoning, but on sending an Indian up the highest trees during the afternoon, he only gave us the unwelcome intelligence—"No sign clearing; big woods all along." The next morning early we were determined to try our best to get out of our dilemma, and it was decided that we should stow away all our goods and chattels, and leave them covered up with branches, so that if we got out all safe we might send in for them afterward, there being but little fear of robbery in such a situation. We therefore took with us only a blanket and our guns, and being thus lightly burdened we made good way. But after a long and tedious march until mid-day, we could strike no blaze (i. e., the marks placed upon trees by surveyors in the back settlements), and we sat down to rest and devour our last scrap of biscuit and a small tin of chocolate among six, with anxious thoughts as to what would constitute the next meal. Off again, we traversed thick woods, descending all the time, and in a valley first discovered an old blaze, which gave us fresh courage, and we contrived to follow it for some distance, until, to our chagrin, we found ourselves on the shore of a large lake, about midway from its extremities, so there was nothing for it but to trudge, wearied as we were, all round its lower end, which, having been accomplished, we struck out through the forest again by compass, no blaze being seen. It was getting dark, and we had given up all hope of getting out that night, when Peter Paul, who was some distance ahead, called out, "Road! road!" and, on arriving at the spot, sure enough there lay an old track, which, following to the southward till dark, we came to an open spot surrounded by woods, in which was a field of potatoes and turnips. I may be excused when I say that we dispensed at such a time with the ordinary courtesies of society, and every one was allowed to help himself; and a ludicrous sight it was indeed to see through the gloomy darkness the forms of six hungry individuals sitting in the midst of a turnip patch refreshing themselves with the vegetable esculents. An old shed, with large holes in the roof, stood in one corner of the clearing, and to this we adjourned, and, making a fire outside, roasted potatoes and made ourselves as comfortable as we could; but the rain began to pour down in torrents, and, drenched and weary, we passed an almost sleepless night. The morning, however, no sooner dawned than we trudged down the road, and hearing the sound of an ax, directed our course that way, and soon found ourselves in the presence of a worthy settler, whose snug farmhouse lay close by on the banks of the Siniboo River, in Digby County. A forlorn-looking group, indeed, we must have appeared, all tattered and torn as we were after our hard travel over mountain and swampy barren, but the heart of the worthy man warmed toward us as he hurried us along to his dwelling; and soon with his table groaning under the weight of good fare, he bade us welcome to civilized life once more; and it is almost needless to add that, while enjoying such welcome hospitality, we soon forgot the weary tramp we had made through the trackless depths of the Nova Scotia backwoods.

J. MATTHEW JONES.

Halifax, N. S.

Of all the places in the vicinity of New York City, noted for their beautiful scenery, the Palisades are the most celebrated—for their proximity to the city as well as for the grandeur of their scenery. There, within twenty miles of the City Hall, one may wander for miles through an uninterrupted forest continually encountering new and varied objects of interest.

Yet how few have ever explored them; nearly all think they have "done" the Palisades by sailing up the Hudson, or, perhaps, by going up to the hotel. Viewed from the river they appear nothing more than a rocky bluff, and those who have seen them at the Palisade House have seen but a small portion of the less interesting scenery.

The summit was once surveyed for a railroad, but happily that was all. At the thought of a railroad through this romantic region one feels something of the indignation of Ruskin when all the poetical associations of certain English gleus were driven off by the whistle of the locomotive.

The origin of the Palisades is too well known to be mentioned. The cliffs, with but few exceptions, are divided by a wide, imperfect crystallization into cubical masses, by the action of frost and water aided by the prying power of roots growing in the crevices. Whole columns of these are frequently precipitated to the increasing debris below. All along the verge, rocks weighing many tons may be thrown down by prying, so exactly are they poised. Several miles above the hotel an irregular fissure, nearly a hundred yards from the edge, has recently appeared. It is about a yard in width, and accessible to a depth of twenty or thirty feet, and extends, though interrupted in places, for upward of a mile. From these facts we must infer that the time is not so far in the future when the Palisades, as such, will no longer exist. Already the debris in many places extends upward over three hundred feet, and greatly detracts from the grandeur.

Many of the rarer birds of prey make their eyries in some niche in the overhanging wall, baffling the most enthusiastic oologist; the rocky fissures afford a congenial retreat for many of the smaller mammals, and, upon rare occasions, the den of a wild cat has been discovered in the more inaccessible fastnesses. In some of the brooks west of the Palisades trout abound. I caught sixty-eight last season, many of them weighing over half a pound, from one small stream in which one would not have believed it possible for them to exist. Many rare mountain plants flourish upon the scanty soil to reward the botanist. In fact, every one will find something of interest, while he will meet with but one obstacle, the copperhead. Even this is more imaginary than real, for though I have traveled the entire extent of the Palisades, I only once encountered this venomous snake. While swinging down a precipitous place by means of trees, some large rocks were overturned, and a nest of copperheads disturbed, four of which were duly killed and preserved.

But perhaps the Palisades are most interesting to the student of nature in her more poetical forms. The upper portion of the Palisades is by far the most interesting—the cliffs are said to be one hundred feet higher. Rocky pinnacles, far exceeding in height the Egyptian obelisks, which look as though the gentle breeze might overturn them, point to the sky; rugged caves and deep fissures, partly concealed by the dense foliage of evergreens—all tend to render the scenery wild and fascinating.

In winter the Palisades and their surroundings present a magnificent spectacle. During the spring, when all nature seems to have been born again, they are exceedingly beautiful; but there is a certain portion of October when they are surpassingly lovely.

During one of these fall days, the lover of nature in her wildest forms should seek some one of the grotesque, moss-covered rocks overhanging the precipice. Here, with some pine's gnarled branches swaying over one, gazing down the perpendicular mass of rock the view is unobstructed, save by perhaps a struggling cedar that forcibly reminds one of Shelley's "Prometheus." Below the Hudson is seen stretching away in either direction from the Highlands to the Narrows. To the east, the glimmering Sound and Connecticut shore are seen beyond miles of intervening country. Westward the eye wanders over miles upon miles of varied landscape bounded by the distant Ramapo.

ÆLIANUS.

## SPLIT BAMBOO RODS.

To our customers and the public:—In reply to the damaging reports which have been circulated respecting the quality of our split bamboo rods, by "dealers" who are unable to compete with us at our reduced prices, we have issued a circular which we shall be pleased to mail to any address, proving the falsity of their assertions.

CONROY, BISSETT & MALLESON,  
Manufacturers, 65 Fulton Street, N. Y.

—The *Chasse Illustrée* tells of how a groom overcame the obstinacy of a pair of ponies. He was leading the little fellows by a halter, when both of them became obstinate and refused to pass through a certain gate. The animals were such pets that he did not like to whip them. So, considering for a moment, and being a powerful man, he just lifted up in his arms one of the miniature horses and carried him inside when his companion quietly followed.

—It is understood that His Majesty the King of Sweden, has instituted a new order of knighthood, and that honors are to be given to leading farmers and agriculturists in the kingdom. We may shortly look for Baron Beans, Prince of Parsnips, Count of Carrots, Marquis of Mushrooms and the Duke of the Dunghill.

## Fish Culture.

**SALMON IN PENNSYLVANIA.—A FAIR FISH CAUGHT IN THE BUSKILL.**—We have to congratulate Mr. H. J. Reeder in the positive appearance of salmon in the State of Pennsylvania, of which he is the Fish Commissioner. In view of the controversy whether salmon can be successfully bred in the streams where they once existed, or where they never were found before, the question seems now to be positively settled in the affirmative. Such evidences as we see every day should make Legislatures in other States direct their attention to stocking the rivers with useful fish. To give briefly the history of salmon culture in Pennsylvania, we may state that in 1872 Mr. Stout, Mr. T. Norris and Mr. H. J. Reeder placed salmon eggs in hatching boxes in a spring near Easton. The fish from these eggs thrived, and were further matured in a large spring by the Bushkill, near Yoh's upper dam. Later, some 40,000 eggs were hatched out coming from Bucksport, Maine. Now, there cannot be any doubt but that the salmon captured in the Bushkill on the 14th owes its origin to the small fish placed somewhere in the Delaware or its tributaries. We are indebted to the *Easton Free Press* of the 14th November for an excellent account of the salmon:

The fish was discovered in Grootzloger's mill race, on the Bushkill, at the foot of Fourth street, and its unusual size immediately attracted the attention of a number of people. After some difficulty the fish was secured by Mr. James Young. Mr. Young presented his prize to his uncle, Mr. J. E. Stair, and as it was very generally believed to be a salmon, Mr. Stair, appreciating its important bearing on certain mooted points of the history and habits of this fish, and in the interest of fish culture, thoughtfully placed it at the disposal of Fish Commissioner Howard J. Reeder. The point at issue with scientific men, referring to salmon, is whether this fish placed in rivers as far South as the Delaware and Susquehanna will, with the instinct of their class, return to the grounds where they were hatched, and as nothing but experiment will prove this, the importance of all evidence bearing upon the controversy will be realized. At different times during the past four years a great many thousand salmon eggs and salmon fry have been deposited in the Bushkill and Delaware rivers under the supervision of Commissioner Reeder, and at various times reports have been circulated of salmon of considerable size being caught at Bordentown, Trenton, Carpenter's Point and other points on the Delaware, ranging from five to eight pounds weight; but unfortunately these have fallen into hands that did not perceive anything in the fact, beyond the table, and their evidence was lost to the scientific world. But this fish is a fact, and in official hands will be irrefutable evidence that the stocking of our rivers with the most valuable fish in the world is not visionary, but practicable. Its further significance will be that it will stimulate legislation to foster and advance our fish interests by more substantial aid and encouragement to our Fish Commission than has heretofore been given to it. The fish in question is a fine specimen. It is female, and its dimensions and description are as follows:—Total length, 32 inches; length of head, 6½ inches; girth at dorsal fin, 15 inches; caudal, when expanded, 9 inches; form, an elongated ellipse, greatest breadth in front of dorsal; bronchial rays, 12. Fiu rays as follows: Pectoral, 13; ventral, 9; anal, 9; dorsal, 12; caudal, 18. Color (after being out of the water nine hours), back, greenish blue; sides, silver gray; belly, white marked by black irregular spots like an x or the club spot on cards, with smaller reddish spots shaped along the back and above the lateral line; teeth incurred, a line on each side of the upper jaw, and an inner line on the palatine, two rows on the tongue and one row on the outer edge of lower jaw bone. It has, besides, the second dorsal adipose fin, the peculiar and exclusive characteristic of the salmon family.

## FISH CULTURE IN NORTH CAROLINA.

GREENSBORO, N. C., November 11, 1877.

CHAS. HALLOCK, ESQ.:

Dear Sir:—When, in the fall of 1875, I had the pleasure of your company from Southwestern Virginia across the Unaka Mountains and Blue Ridge to Western North Carolina, there were two points to which I particularly desired to take you, they were Asheville and the Black Mountain; but circumstances prevented, and you left us one cold, snowy morning, for the nearest point on the rail in East Tennessee. I have regretted ever since that you did not see Black Mountain at least, being the highest east of the Mississippi, and measuring almost a thousand feet more than White Top, which you ascended with Col. Reed, and which attains 5,900 feet. From our camp on Nest Camp Creek, where you left us under the escort of the faithful Kile, it was distant about two days' ride. I hope, however, that an opportunity may soon again offer for completing your visit to Western North Carolina, and would advise that you select that section for your next Summer's recreation. The best route for reaching it is via Salisbury, and thence over the Western Railroad to Henry's Station, where the rail ends, and a Concord stage affords the transportation to Asheville, twenty-one miles. At this point all kinds of conveyances can be procured, and the best of fare and accommodations at the Mount Airy Sanitarium, which Dr. William Gleitzman has there instituted for the treatment of persons suffering from pulmonary affections—the high altitude, pure and dry air, being especially beneficial for such cases.

All the mountain streams of Western North Carolina are good trout waters, and from them many can be selected which afford excellent sport; besides, in a few years, there will be plenty of salmon in the rivers and their tributaries, as the propagation of fish has been commenced in this State.

Having occasion to visit Asheville recently, I stopped to visit the Hatchery established at Swannanoa Gap, *en route*, and was greatly pleased with the progress made. I found the Superintendent, Mr. W. F. Page, of Lynchburg, Va., in charge, assisted by Messrs. S. G. Worth and W. W. Vandiver. The entire establishment is somewhat primitive, and economically constructed, but quite well adapted for the purpose. Two hundred and fifty thousand eggs of the California Salmon (*Salmo gairdneri*), shipped from the U. S. Salmon Breeding Station on the McCord River, on October 2, reached the Hatchery on the evening of the 12th, and by 3 A. M. on the 4th were all deposited. The hatchlings commenced almost immediately, and the last tray on which the eggs rested was removed on the 4th inst. The fish are now an inch and over in length, and have the sacs about one-third absorbed. They are in good condition, the percentage of loss being low. The water supply comes from a small branch, entering the troughs first a half mile from the spring, and is consequently subject to considerable variation of temperature. The Hatchery has a capacity of nearly three

quarters of a million of salmon eggs; 25,000 trout eggs are expected in a few days. I met General Vance, the present Governor of this State at the hotel near by. He had just visited the Hatchery, in which he takes a great interest. I gave him several copies of the *Forest and Stream*, with the information that he would find it a standard authority on all subjects relative to fish culture.

When the fish are sufficiently grown, they are to be turned into the headwaters of the French Broad, flowing northwest, and those of the Catawba, flowing south, from this divide.

Thus you will see that should you conclude to come this way, you will find something to interest you.

WAGNER.

—Mr. B. B. Porter informs us that at his pond at Oakland, Bergen Co., N. J., he has salmon from 15 to 18 inches long. These fish were hatched from eggs coming from Bucksport, and were placed in his pond in the winters of 1874 and 1875. The salmon have been fed upon chopped lights, liver and thick milk. The fish are fairly tame, and will take food from the hand. By the way, Mr. Porter's fine place is for sale at auction. It ought to be purchased for the State for purposes of propagation.

### EDITOR FOREST AND STREAM:

**CULTURE OF WATER PLANTS IN FISH PONDS.**—I am glad you have called the attention of fish breeders to the importance of cultivating aquatic plants, especially in those water courses and lakes that are restocked with fish, for they are an absolute necessity. They form a nursery, shade and shelter and a hiding-place where the young will go for self-protection. These water plants are as necessary for fish as trees are for birds. Water-cresses are excellent plants, and will thrive in water two feet or less in depth, on a mud bottom. They are easily grown from seed, which can be purchased of J. M. Thorburn & Co., No. 15 John st., at \$3 per pound. A small quantity will sow a large area if carefully and economically distributed. Water-cresses are also desirable for the table during the winter and spring months. Wild rice grass is good. Will not some of the seedsmen obtain and advertise it?

SUBSCRIBER.

—Dr. J. C. Colburn, of Kingston, N. Y., has been stocking his private pond on his farm with black bass and catfish having putabout 40,000 young fish into the pond.

**COLLECTING SPAWN IN THE GREAT LAKES.**—The Sheboygan (Wisconsin) *Herald* says:

Mr. Henry Porter, who has charge of the Michigan State Fish Hatcheries, at Niles, and his assistant Mr. A. Briggs, have been here for the past week or so gathering trout spawn. The gentlemen go out with the fishing tugs every morning and carefully possess themselves of the eggs of live fish that are ready to spawn, and then pack them properly and ship them to Niles. They have so far collected 1,500,000 eggs, and mean to swell the number to 3,000,000 before they leave. The work is prosecuted at the expense of the State of Michigan. Mr. Porter informs the *Herald* that the eggs were secured at Milwaukee last fall, but he finds this a much better point for collection and preservation of spawn.

**GRASS BASS FOR PENNSYLVANIA.**—Fish Commissioner B. L. Hewitt has brought from the Licking Reservoir, Ohio, 130 grass bass, part of which have been placed in the Susquehanna, at the water-house, Harrisburg. Other invoices are to follow. Black bass have been placed in the Little Shamokin at Sunbury.

**THE WORST SORT OF POACHERS.**—In the subjoined letter Mr. Seth Green shows up a class of poachers in a fashion that may not be flattering to their sense of self-appreciation:

ROCHESTER, Nov. 14, 1877.

Mr. Editor:—The worst poachers we have in the country are men owning small trout ponds, who pretend to be fish propagators. They net the streams for miles around during all seasons of the year, and keep them until the close season is over, and then sell them. There is a law now against that kind of work, and everybody should keep their eyes on all such poachers. No man can do any fishing in trout streams out of season unless he owns the whole of the stream, from one end to the other, under a penalty of not less than ten dollars nor more than twenty-five for each offense; and no person can have any speckled trout, after the same has been killed, in his or her possession during the close season, under penalty not exceeding twenty-five dollars for each fish.

Yours,

SETH GREEN.

## Natural History.

### AMERICAN ACCLIMATIZATION SOCIETY.

THIS society held its regular meeting at the Aquarium on the 14th. The Chair was occupied by Mr. Eugene Schieffelin, Dr. J. W. Green acting as secretary. Among the gentlemen present were: Messrs. Robert B. Roosevelt, of the Fish Commission; John C. Pennington, of New Jersey; Eugene Keteltas, John C. Mills, Edward Schell, S. R. Bunce, Edgar De Puyster, Wilson De Puyster, Mr. Conklin, of the Central Park Museum, and others. Mr. Conklin read a paper on acclimatization, with special reference to birds. He detailed the efforts made in this country to introduce foreign birds. In 1864, he said, the Commissioners of Central Park set free fifty pairs of English sparrows, and they had multiplied amazingly; Mr. Joshua Jones had freed English chaffinches, blackbirds, and Java sparrows in the Park, but unfortunately their numbers were so small the birds were lost sight of. In 1874 Mr. Henry Reiche set loose fifty pairs of English skylarks, but they all crossed the East River and settled near Newtown and Canarsie. The Cincinnati Acclimatization Society had successfully introduced the skylark there, and it was now becoming abundant in the neighborhood of the city. Last July the Acclimatization Society freed in the Park some starlings and Japanese finches; Mr. John Sutherland had done the same with some English pheasants. It was expected that they would all prosper. Mr. Conklin suggested that renewed and organized efforts should be made to acclimatize the English titmouse, chaffinch, blackbird, robin redbreast, and the skylark—birds which were useful to the farmer and contributed to the beauty of the groves and fields. Mr. Robert B. Roosevelt read a paper on the acclimatization

of fish. The President of the American Fish Culturists' Association showed that our efforts should be mainly directed to distributing the best of our own fishes through all the waters of the continent, and spoke of what had been done in this way with shad and salmon. The Oswego bass, he thought, was deserving of extensive propagation; but particularly spoke of the land-locked salmon of Maine and Canada, and the California brook trout. The latter fish he considered one of the best which swims in American waters, and was convinced that it would well repay the trouble of propagation here. The great interest taken at present by the public in the acclimatization of animals, birds and fish, and the support it must receive from all naturalists and sportsmen, must in time render this association the leading one of its kind in the United States.

### SEA SERPENTS.

GOOD old Eric Pontoppidan, Bishop of Bergen, was by no means a naturalist of indifferent abilities. But if that honest worthy had a talent for any one thing it was for finding out marine monsters. The Bishop was not only an implicit believer in the great sea serpent, but he accepted the kraken, and most anything else that was told him. Of course the prestige of this Scandinavian prelate had its weight, and to this day the belief in wonderful marine monsters is more prevalent in Northern Europe than anywhere else. We notice quite lately that Mr. Frank Buckland, quoting Sir Walter Scott, tells how the great novelist was rather disposed to believe in sea serpents; and he mentions that to-day it would be difficult to shake a Zetlander in his confidence in the existence of marine monsters.

The majority of these stories were monopolized at one time by Northern prelates. It was Orlaus Wormsus, in 1643, who said that the kraken came out of the water more like an island than a beast. The old Latin is *Similorem insula quam bestia*. Eric Falkendorf, Bishop of Maros, wrote to Pope Leo, as early as 1520, about a sea serpent of incalculable length and complexity of coil; and two years later Olaf Magnus, much more moderate, saw a snake only fifty feet long. People in those days had peculiar arguments to prove the existence of sea monsters. For instance, if a fisherman went out with his lines adapted for thirty fathoms of water, and found in a certain locality, the depth of which he believed had been well ascertained, that his line touched ground at ten fathoms, it was perfectly clear to the fisherman that there was a sea monster in the depths below, and that the difference in sounding was owing to a monster being at the bottom of the sea. About 1808, a clergyman asserted that he saw off the north of Scotland a serpent eighty feet long. The locality was between Rum and Canna. If not for the clerical character of the witness the locality of the sea serpent might be between Santa Cruz rum and good Scotch whisky. It was in 1817 that first was agitated in the United States the sea serpent. Then the *Monstrum horrendum* was seen off Cape Cod, and the Linnean Society of those days investigated the matter, sending a commission to the locality. That particular snake was only one hundred feet long, which may, however, be considered fair as a first attempt. It is hardly worth while to refer too far back in regard to sea serpents, though we might quote Aristotle. We will direct our attention to such descriptions of the sea serpent as have come under our notice during the last few years.

The locality of the sea serpent has somewhat changed, though still found in the north, he has been occasionally seen much further south. He has made his appearance as late as 1875, in the Frith of Forth, off Filey Bay and the North Foreland, off Hastings, and the Isle of Arran, and at Menai Straits and Prawle Point. This locality is, as it should be, well to the north, but Captain Drevar, of the ship *Pauline*, in the same year, off Cape Roque, declares that he and his crew saw a sight which filled them all with terror. "Starting straight from the bosom of the deep, a gigantic serpent rose and wound itself twice in two mighty coils round the larger of two whales which it proceeded to crush in genuine boa-constrictor fashion \* \* \* The ribs of the ill-fated fish were distinctly heard cracking, one after the other, with a report of a small cannon. \* \* \* Soon the struggles of the wretched whale grew fainter and fainter; its bellows ceased, and the great serpent sank with its prey beneath the surface of the ocean." This was indeed a horrible monster! The officers of the *Pauline* declared the serpent to have been 150 feet long, and that twice it reared its crest sixty feet out of the water as it meditating an attack upon the ship itself.

Once in 1875, the real original sea serpent came very near being captured: It was a Captain Taylor who wanted to noose him with a lasso. It was brave John Abes, the mate, who was tried to get on the bow spirit, and do the deed; but John Abes got frightened, and fell overboard. Bold John, however, wrote a letter about it, in which he said, "The brute was then within a few yards of me, with its monstrous head and wavy body soaking ten times more horrible than it did on board the brig. I shiver even now when I think of it! Whether the noise made by throwing the rope over to save me scared him, I cannot say, but he went down suddenly, though not more so than I came up. After a few minutes he appeared some distance from us, and then we lost him."

We come now, however, to some authorities that, irreverent as we may be in regard to sea serpents, we are forced to treat with a certain respect. The sea serpent had the honor of appearing in nothing less than an Official Report to Admiralty. In June of this year, on her Majesty's yacht *Osborne*, on the

2d of the month, off the coast of Sicily at 5 o'clock p. m., the sea serpent turned up once more. "The sea was unexpectably smooth, and the officers were provided with good telescopes. The monster had a smooth skin, devoid of scales, a bullet-shaped head, and a face like an alligator. It was of immense length, and along the back was a ridge of fins about fifteen feet in length and six feet apart. It moved slowly, and was seen by all the ship's officers." This account is supplemented by an article written by a lieutenant on board the Osborne, who made a sketch of the sea serpent, who says: "From the top of the head to the part of the back where it became immersed, I should consider about fifty feet, and that seemed about a third of the whole length. All this part was smooth, resembling a seal."

In the month of May of this year, in latitude 3° north, and longitude 90° 53' east, the crew of the barque Georgina, bound from Rangoon to Falmouth, saw the sea serpent. This time it was not so large, being only fifty feet long, "gray and yellow in color, and ten or eleven inches thick." It was in view for twenty minutes. Another account of this snake, emanating from the same source, states that "for some days previously the crew had seen several smaller serpents, of from six to seven feet in length, playing about the vessel." We may remark, parenthetically, that Rangoon arrack is a very powerful stimulant.

In the last number of *Land and Water*, a correspondent takes up this sighting of the sea serpent by the officers of Her Majesty's yacht Osborne, and believes that all which was seen was a turtle, either the *Chelonia caouana* or the *C. carivacea*, pursued by a shark or sharks. Undoubtedly a shoal of basking sharks, one following close after another, might be taken for a single creature. Though we may have only lately accepted the huge size of the cuttle fish by no means follows that we should credit the stories told about sea serpents. That largely developed individuals of certain species of animals may exist is not to be denied; though it is not probable by analogy, since huge reptiles once existed on the earth and are no longer present, that there should be exceptions in regard to the inhabitants of the sea. We are right to suppose that the elephant on the land and the whale in the sea represent these two limits.

We have no inclination to discredit marine stories, nor to even suspect that the toilers of the sea are given to amplifications. We bear in mind some curious facts in regard to a sea serpent. Some two years ago there was great excitement at the Smithsonian Institution, and various telegrams were interchanged between Washington and New York in regard to a huge sea serpent which was obstructing the East River. The wonder grew as it was talked about. Not only was there a sea serpent, but it had been captured. The *FOREST AND STREAM* was at fever heat. We sent out reporters to look up the horrid thing. At last we thought we had it. *Parvulus montes*, etc. That snake turned out to be a little boa, which having died on board of some ship coming into port, the cadaver had been pitched ignominiously overboard into the river. This monster, said to be of indescribable size (half as long as from the Battery to the Post Office), was really not more than five feet in length; and the wonder now graces the collection of Mr. Eugene G. Blackford. Let us take all sea serpents, then, *cum grano salis*.

#### HISTORY OF THE BUFFALO.

AS the early accounts of the buffalo are quaint and interesting, as well as worthy of preservation, I have collected some of them as forming part of the history of the huge denizen of the plains, now so rapidly disappearing.

The chroniclers of De Soto's expedition say nothing of the buffalo. Guzman saw them in Cuialoa (Mexico) in 1532. In 1539 Father Marco De Nica, in exploring Northern New Spain, says that in the kingdom of Totontec they showed him a hide "half as big again as the hide of an ox, which they said belonged to a beast with one horn. The color of the skin was like that of a goat, and the hair was a finger thick."

In 1540 Coronado, in his celebrated expedition, first heard of buffalo at Cibola (Zuni), and says the people "travel eight days' journey into certain plains, lying toward the North Sea. In this country are certain skins well dressed, and they dress them and paint them where they kill their oxen, for so they say themselves." He also saw an Indian there from another province who had a buffalo painted on his breast, and his chronicler, Castaneda, speaking of the hides, says they are "covered with a frizzled hair which resembles wool." After leaving Cicinc (Pecos) he says: "All that way and the plains are as full of crooked-backed oxen as the mountain Screna in Spain is of sheep, but there is no people but such as keep those cattle."

In a work published at Amsterdam in 1637, called "New English Cuauna," by Thomas Morton, he says: "The Indians have also made description of great herds of well-grown beasts, that live about the parts of this lake (Brook), now Lake Champlain, such as the Christian world (until this discovery) hath not bin made acquainted with. These beasts are of the bigness of a cowe, their flesh being very good food, their hides good leather; their fleeces very useful, being a kind of woole, as fine almost as the woole of the beaver, and the salvages do make garments thereof. It is tenne yeares since first the relation of these things came to the eares of the English."

In Sir Humphrey Gilbert's voyages, which commenced in 1533 (Hakluyt), he says there are in Newfoundland "buttoles, or a beast it seemeth by the tract and foot very large in maner of an ox."

In a description of New York, written about 1660, it says: "Traders who came from a great distance make mention of lion's skins which will not be bartered because they are used for clothing, being much warmer than others."

In a work published by Hakluyt, in London (1589), it is stated that in the Island of Newfoundland were found "mighty beastes like to camels in greatnes and their feete were cloven. I did see them farre off, not able to discern them perfectly, but their steps shewed that their feete were cloven, and bigger than the feete of camels. I suppose them to be a kind of buffes, which I read to be in the countreys adjacent, and very many in the forine land."

Gomara gives the following description of the buffalo as seen by Coronado and his army in 1540: "These oxen are of the bigness and color of our bulls, but their horns are not so great. They have a great bunch upon their fore-shoulders, and more hair upon their forehead than on their hindpart, and it is like wool. They have, as it were, a horse mane upon their back-bone, and much hair, and very long from the knees downward. They have great tufts of hair hanging down their foreheads, and it seemeth they have beards, because of the great store of hair hanging down at their chins and throats. The males have very long tails, and a great knob or flock at the end, so that in some respects they resemble the lion, and in some others the camel. They push with their horns, they run, they overtake and kill a horse when they are in their rage and anger. Finally, it is a fierce beast of countenance and form of body. The horses fled from them, either because of their deformed shape or else because they had never seen them. Their masters have no other riches nor substance; of them they eat, they drink, they apparel, they shoe themselves; and of their hides they make many things, as houses, shoes, apparel and ropes; of their bones they make bodkins; of their sinews and hair, thread; of their horns, maws and bladders, vessels; of their dung, fire, and of their calf-skins, budgets, wherein they draw and keep water. To be short, they make so many things of them as they have need of, or as may suffice them in the use of this life."

Another author, Purchas, says that as early as 1613 the adventurers in Virginia discovered a "slow kinde of cattel as bigge as kine, which were good meate."

Joliet and Marquette in descending the Mississippi in 1673 saw the buffalo, and the latter says of them: "We call them wild cattle, because they are like our domestic cattle; they are not longer, but almost as big again and more corpulent; our men having killed one, three of us had considerable trouble in moving it. The head is very large, the forehead flat, and a foot and a half broad between the horns, which are exactly like our cattle, except that they are black and much larger. Under the neck there is a kind of large crop hanging down, and on the back a pretty high hump. The whole head, the neck and a part of the shoulders are covered with a great mane like a horse's; it is at least a foot long, which renders them hideous, and falling over their eyes prevents their seeing before them. The rest of the body is covered with a coarse curly hair like the wool of our sheep, but much stronger and thicker. It falls in summer, and the skin is then as soft as velvet. At this time the Indians employ the skin to make beautiful robes, which they paint of various colors."

The first engraving of the buffalo was in the first edition of "Hennepin's Travels." Alvar Nunez in 1535 saw buffalo near the Gulf, and Jontel, one hundred and fifty years afterward, saw them at Bay St. Bernard. Father Venegas does not include them in the animals of California, and neither Harmon nor Mackenzie speak of them in New Caledonia. Du Pratz, in 1758, says they do not exist in Louisiana. In 1756 some of those who settled in the Abbeville district of South Carolina found buffalo there, and in 1774 Bernard Romans speaks of them as a "benefit of nature bestowed on Florida."

We find the trade in buffalo wool a considerable one in the last century, and numerous factories were established for its manufacture. The slaughter of the buffalo has been the greatest in the past thirty years, and since the settlements and railroads have extended into the buffalo range the buffalo has frequently been domesticated, and the Bois Brules put them to use as work cattle.—*Dr. Wm. E. Doyle, in Washington Sunday Herald.*

[How easy it is under the light of history to trace the gradual extinction of this race of noble animals. The remnants are now comprised in two inconsiderable bands, which are confined to circumscribed localities—one in northwestern Texas, and the other to southern Dacotah. Over five millions of buffaloes have been killed within the past six years, chiefly for their hides!—*Ed. F & S.*]

#### CAN THE PARTRIDGE WITHHOLD HIS SCENT?

MR. EDITOR:—This is a question which is often propounded, and as frequently answered in the negative as affirmatively. I remember my illustrious kinsman, Frank Forester, in his admirable work, which is just now out of my library, was of opinion that the bird in question was possessed of that faculty, but whether it was voluntary or involuntary, the effect of the will, I am not informed that he determined. Nor have I ever seen advanced any theory or supposition tending to explain this wonderful quality. Before submitting my own ideas upon this subject, which I believe are plausible at least, I would remind you of the marked distinction in the quail of your Northern States and the Canadian and the *Perdix virginianus* (accepting Forester's nomenclature) of this section. The Virginia partridge, which I contend is no quail, is smaller than his cousin *ortyx*, and more vigorous and rapid on the wing. He is, moreover, the bravest of all game birds that long and varied experience has given me any knowledge of; invariably dying hard or remaining upon the wing until life is wholly extinct. In fact, I have always observed that when struck fatally he is certain to fall dead.

Perhaps all this is a little irrelevant, but I merely mention this lest some of your northern sportsmen who have had much quail shooting should confound this king of all game fowls with his larger brother.

In support of my theory allow me to cite two occurrences which came under my own observation, and one of them quite recently:

The first that I will record took place last season. In a thick cover of grass my English setter Dash pointed four birds, full fledged and vigorous, in January, when they had attained to the standard of old and knowing fellows. I had reason to judge they had been flushed by the hawk, that terrible pirate of the upper seas, and upon flushing, I contrived to bag a couple of cocks, leaving only two birds remaining.

Their flight was not a very long one, and I watched closely

the spot where they went down, beside a small pine which had been felled, being then in full leaf, but russet and completely withered. In a few moments Dash and I were on the ground, and he is the most knowing hunter you ever saw. Vain were his efforts to wind or trail them. After several minutes of close hunting, and after I had thoroughly beaten cover, I called him off, thinking possibly they had again taken to wing (which is unusual) while I was loading.

After an interval of an hour or two I again visited the fallen pine, and Dash had scarcely drawn to within ten feet of the very cover he had lately hunted when he came to a dead point, and I started the birds. Was his nose at fault? I believe no dog has a better.

On the evening of the 6th inst, I went out for a little sport, reaching the fields at half past one, in company with a friend—Dash our only dog. The wind was from the southwest, blowing a perfect gale, and cold—the day before warm and rainy. Altogether a bad day for game, as we found nearly all of it near woods and under thick cover. Yet despite all this we got a bag of thirty-five, as plump and pretty as you ever saw.

Upon the rise of one covey we brought down five with our four barrels, wounding the sixth, who grounded in a patch of tall reeds.

Out of these he was again sprung, flying directly to me and alighting within a few feet of where I was standing. I refrained from shooting to watch him. The cover this time was of reeds, but lower and sparser. I saw to the very inch where he went down; I could not be mistaken. The closest search with my dog was unavailing, my friend was on the look-out for his rise. He never rose, and we never saw him again. I prefer prefacing my explanations of this faculty with these recitals of facts—absolute facts.

The most casual observer, if he has ever seen a bird while his dog was roding, must have noticed that the bird appeared much smaller when undisturbed, and really smaller than he was.

Why? Because in his fright he has shut his feathers close—he has the power of doing this.

This same tight-fitting coat of his, chemistry tells us, is one of the best non-conductors that we have. If this be so, then is it unreasonable to suppose that it may answer at least the double purpose of shutting out cold and shutting in scent?

Some sportsmen acknowledging the partridge's ability to elude the dog in this manner, contend that he is only able to do this on account of remaining quiet and not moving so as to leave scent. I attribute it to something more flattering to his birdship than this—to the will purely, voluntary and instinctive, and knowledge taught him through that instinct that never errs, for it is but the unadulterated philosophy of nature which she is ever teaching her dumb children.

Norfolk, Va., Nov. 12, 1877.

HARRY HARRINGTON.

#### QUAIL AT SEA.

HAVE WE A NEW VARIETY OF QUAIL?

THE following two quite interesting letters, by a remarkable coincidence, reached us at the same time. The question of the migratory habits of the quail has before attracted our attention. The fact of quail going sometimes to sea may be accidental, caused by stress of weather. But the facts conveyed to us by our correspondent from Norfolk seem to indicate that a new variety of quail is possible. Now, the difference between the Virginia quail (*Ortyx virginianus*) and the European quail is not very great. Coues (page 236) in his "Key to American Birds" says: "The differences between the European and American birds are hardly appreciable." It is generally conceded, though exact weights have never been taken, that the American quail is slightly heavier than the European variety. The European quail is decidedly migratory. At certain seasons of the year it inhabits Europe, some few coming to England, but it migrates in the fall of the year to more southern climes. Four years ago there was an extraordinary migration of quail from Norway into England, the birds coming in myriads. The islands and shores of the Mediterranean swarm with them. As many as a hundred thousand quail have been killed within a limited space off the coast near Naples. At certain periods quail appear in Africa, and later they traverse the Mediterranean. The appearance of a new quail in the United States, if substantiated by further evidence, would be a curious ornithological fact and well worthy of study. We believe that efforts have been made to breed quail on the islands of Jamaica and St. Croix. There may be the least chance that, true to their migratory instincts, these birds may have crossed the ocean. Of course, this is only a supposition on our part.

The general behavior of the birds, as described by our correspondent when shooting in North Carolina, was at least peculiar; and, as the writer is a sportsman and familiar with the form and general appearance of our own bird, the belief may be entertained that some difference may exist between our native birds and the new-comers. Of course we will do our best to throw further light on this subject:

EDITOR *FOREST AND STREAM*: BALTIMORE, Nov. 13, 1877.  
Will you kindly inform one of your now readers through your columns if there are, so far as you know, any recorded instances of our American quail making excursions to seaward? Or if there are any varieties of the quail family which are accustomed to "go to sea," either for pleasure, profit or pure cussedness?

I am induced to make these inquiries for the reason that some days since a reputable gentleman of my acquaintance recently arriving in this city from Rio de Janeiro, made to me a statement which leads me to believe that such a species does exist. This gentleman states that one day, on the voyage up, while lying "hove to," some hundred miles or more to the southward and eastward of Cape Hatteras, there came on board the barque, no less than thirty or forty quail! It had been blowing very heavily from the SE. for the previous thirty-six hours, and my informant states the birds in question, before seeking a refuge in the rigging of the vessel, had been observed apparently endeavoring to hold their way, directly into the teeth of the gale. After coming on board several of them were so exhausted they were readily captured. Others succeeded in escaping from the clutches of "Jack," and left the ship, it is feared, to perish; while others maintained an existence so far aloft for Jack to trouble them in such heavy weather, and were seen, as fainter weather came on, and the barque was enabled to resume her course, to also resume their flight to the eastward, or, perhaps, a little to the southward of it. In reply to the incredulous remarks which

greeted his statement, the gentleman said he was positive the birds were quail, but thought they were a heavier winged and smaller bodied bird than those generally seen hereabouts. At all events, he swears they tasted like partridges, for a right royal feast they had on them when the sea got down, and the cook was able to keep his broiling irons on the galley fire. I regret that, if eat them they must, at least the skin of one of them could not have been saved, to be put in as documentary evidence of the truth of this remarkable "yarn."

Yours,  
J. G. W.

EDITOR FOREST AND STREAM: NORFOLK, Va., Nov. 10, 1877.

Sir—My attention was recently attracted to the appearance in Carter Co., N. C., where I have recently been shooting, of a, to me, new game bird. For the sake of information, I append a short description.

In size, it is about one-fourth smaller than our quail; in color and marks it strikingly resembles that bird. The wings, however, are somewhat longer, and the tail shorter. The marks about the head are similar, but not so distinct. On the throat of the male, or what I assume to be the male, there is a curious cross-shaped mark of darker feathers. They are found in bunches of from six to twenty, and when flushed near the coast, they "tower" like the snipe; and when at an altitude of five or six hundred feet, strike straight out to sea. I shot several, although they puzzle the dogs sadly by running and skulking closer than any bird I ever hunted. The flesh is equally good with that of the quail. I showed them to several persons, none of whom had ever seen such birds before. The general impression is that they belong to the quail family, but whence they come or whether they go (except to sea) none of us know. Can any of your readers inform us?

Yours,  
VIRGINIAN.

CUPIDONTA CUPIDO.—HOW THE PRAIRIE CHICKENS WOO.—The following interesting bit of natural history was received at this office during the absence of the managing editor, and set aside, for what reason we know not. However, it has not spoiled by keeping. We have searched the standard books through without success in the endeavor to discover minute mention made of the manner in which the prairie fowl "toot." The peculiar stages of courtship—the precise character and method of the amours which have given the suggestive name of *Cupidonta cupido* to the pinnated grouse, seem not to have been described by any author. This fact, therefore, renders the subjoined sketch all the more interesting and valuable. While we are quite ready to publish the secrets of the prairie harem (now that they are divulged), to gratify the curious, we feel bound in duty to say that no natural inquisitiveness would induce any gentleman of honor to pry into those private affairs of domestic life which should ever be considered sacred from intrusion; and the only excuse the writer of the following letter can have to offer in extenuation of his offense, is that he acted in the interest of science. Oh, Science! how many sins have been committed in thy name!

EDITOR FOREST AND STREAM: MONROE, Indiana, Sept. 9th.

I have been living for more than twenty years where chickens were as plenty as blackbirds are in most places, and have seen them so plenty that they were a nuisance, and farmers generally were glad to see some "city chap from town" come along with a shot gun and thin them out. Generally, on the warm days in the last of March the chickens collect on the bare knolls where the sun shines warm and the grass is short, to do their love-making, and go through all the preliminaries before nest-building. At such times they are very noisy, and almost without fear. I have lain behind an old feed sack within twenty yards of them, watching through a most excellent glass their motions for hours at a time. I could see their eyes and every motion as plain as though the birds were only ten feet off, and this is what I saw: The cock would stand perfectly still for a moment and stamp his feet very rapidly, and go through a kind of pumping motion with his head and neck, until the wattles on each side of his neck were inflated to about the size of a small orange (and they resembled an orange in color). After he had got himself "mad," as my boys used to say, he would drop his wings so that they would rub on the ground almost enough to bear his weight, and make a straight shoot for the best looking hen in the pack. Just as Mr. Cock would start he would draw his head down on his wattles and stretch them so tight that they would shine as though they were varnished, and make a noise that sounded as if it came through his nose—just three notes, "Boo, hoo, hoo!" His dragging wings seemed to help him, as they were so stiff. Instantly, on stopping, his wattles would collapse, and he would look as though he had done something he was ashamed of.

You have often seen turkey cocks do the same thing in a small way, only the turkey don't stop so suddenly. Generally he has a particular liking for some one of the hens, and she gets most of his "boo hoo." I have seen one cock make half a dozen dives at one particular hen before she was captured, and then not till after lots of running and cackling. It looked and sounded just this way. The hen would see him coming, and would cackle out, "Take care, take care!" and then get out of his way. The cock would come up and find her gone, and would say, "You old fool, you!"

Now, it would be just as impossible for a prairie chicken to make that booming or tooting without that pouch of wind on his neck as it would be for him to sing Old Hundred with it. Yours, MONROE.

SINGING MICE.—When you want a pure tenor, a soaring soprano, or a liquid contralto, anything like a "sniffle" is destructive of these vocal qualities. Pauline Lucca with a cold, Miss Kellogg with laryngitis, or Brignoli with a frog in his throat, would none of them be acceptable to the *impresarios*. Now your mouse, as a sweet singer, is quite an exception to the rules which govern the larger musical bipeds. If you could manage to procure a perfectly sound mouse, and give it asthma, or disturb somehow its respiratory organs, you would develop in that mouse all the qualities of a *prima donna*. You might even get an engagement for that mouse at the Academy of Music, with a salary of \$1,000 a night, besides a carriage, hotel expenses, and cheese *ad libitum*. The music the sick mouse makes may be described as a faint quavering whistle, with harmonious cadence, a kind of minute *pizzicato* sound. Now it behooves people of a musical but philanthropic turn of mind, should they catch a Malibran mouse, to try and cure it of consumption, and at once they will find that their siren is an abnormal *Mus Musculus*, for no sooner well, than the "wee beastie" will be noiseless, save for a common-place squeak. The poetry of the thing is not exactly destroyed, for it seems that it is not only aways who sing before

they die, but also mice. It is quite a problem, however, whether a dulcet mouse has ever worked sufficiently on the susceptibilities of the cynical cat as to have escaped the general fate of mice.

A NEW MONKEY.—The newest claimant to be classed among the *Quadrumanas* comes from Abyssinia. He is said to live high up in the mountains, some 7,000 to 8,500 feet above the level of the sea. This monkey inclines to be troglodytic, for he goes to his little bed in caves. Dr. Ruppell first noticed this monkey as early as 1835, and having brought his skin to Europe, called him the *Macacus Gelada*, Gelada being the native name. The first live specimens have just reached Europe, and six of them are now in the Alexandria Palace.

"The large male," says the *London Times*, "has a considerable mane, as Ruppell describes, and is hairy over the whole of the body, though Ruppell gives the front legs free from hair. On the chest is a somewhat heart-shaped pink patch, free from hair, and a space round the throat of the same color. When the animal becomes angry or excited these become a bright-red color. The nostrils are high up from the upper jaw, and the upper lip is so mobile that it is often turned up so as to show the whole of the upper teeth and gums. The tail is long and large, and ends in a tuft resembling roughly a lion's tail. The color of the hair is brown, except around the breast, where it is gray. The bare part of the chest shows two male indications of teats, and the suture seems to open into a pouch, which, however, it has not been possible to examine, as the animal is still somewhat savage after its journey. The female has not such long hair as the male, and on the bare spot in front are two well-developed teats. The young takes one in each hand and sucks from both at once. While these animals have rejected all fruits, etc., they have eaten Indian corn and grass, taking the grass, pulling it apart and making it into little balls. As Ruppell says, they sleep in caves; a large box was introduced into the cage and the whole of them soon went into it, the old male remaining near the entrance on guard. The group is especially interesting to naturalists from the fact that these are the first ever brought to Europe.

BIRDS AT SEA.—The *Washington Union* says: "Capt. Fitzgerald, of the schooner *Altoona*, which recently arrived from Bangor, Me., reports that while on his way to this port, his ship was boarded by a flock of birds, which he numbers at above a thousand. They were of different species, and commenced lighting on the vessel at 7 o'clock on the morning of the 80th ult., and continued coming during the day, he being at the time about 60 miles south of Long Island, N. Y., the nearest land. At night they took refuge in the rigging and in the interstices between the bundles of laths. Although fed regularly by the captain's wife, the majority of them lived but a few days after their unexpected arrival on board; a small number, however, surviving until the mouth of the Potomac River was reached. When unloading the laths at Wheatley's wharf here a large number of them were found dead in between the bundles. The supposition is that the birds were migrating, when a squall caught them and carried them out to sea."

ARRIVALS AT PHILADELPHIA ZOOLOGICAL GARDENS FOR WEEK ENDING NOV. 19.—Three Virginia deer, *Caracus virginianus*, presented by W. A. Booth, Esq., N. Y. City; three English pheasants, *Phasianus colchis*, presented by John Sutherland, Esq., N. Y. City; one Virginia deer, *Caracus virginianus*, presented by Louis F. Saxe, M. D., N. Y. City; one T'ique monkey, *Macacus cynomolgus*, presented by August Belmont, Esq., N. Y. City; one horned owl, *Bubo virginianus*, presented by Mr. David White, N. Y. City. All of Mr. Barnum's animals have been placed on exhibition during the winter.

A. E. BROWN, Gen'l Supt.

W. A. CONKLIN, Director.

## Woodland, Farm and Garden.

THIS DEPARTMENT IS EDITED BY W. J. DAVIDSON, SEQ. N. Y. HORTICULTURAL SOCIETY.

For Forest and Stream and Rod and Gun.  
WAX FLOWERS.

WHAT numberless attempts have been and are being made every day to learn the art of wax flower making, and how often they have been given up in despair, or urged on by well meant praises from friends (who themselves scarcely know a rosebud from a fuchsia) they produce an imitation so entirely different from the original, that the modeler is often greatly mortified to be obliged to explain what it is intended to represent. This pleasing art, nevertheless, is comparatively easy, and very little instruction is needed to give an appearance of reality to these lovely models. It is also a useful and highly interesting pastime, affording many opportunities for the study of nature in her most beautiful handiwork, and is extremely effective, when neatly modelled and arranged in home decorations, giving a refined and tasteful appearance to the rooms, and is also an excellent aid to those studying sculpture or painting—indeed it is a combination of both on a small scale, as in the moulding of fruit for instance. But the modeler must be perfectly true to nature or the beauty of the object desired is lost; even though it be but the petal of a flower it requires the perfect form and fitting to make it truthful. Forming wax flowers needs time, patience and a correct eye as to color, and last, though not least, materials. It would be best for the beginner not to purchase any quantity of these at first as they would likely be tempted to too many experiments and so weary themselves at the outset. A few of the more simple designs, some sheets of thin white wax, and a few of the thicker quality; some of the green in two shades, half a dozen bottles of the principal colors in powder, and a small quantity of fine-powdered arrowroot, which gives a crisp, frosty appearance to white flowers, such as Camellias, Tuberoses, etc., with the necessary tools, consisting of scissors, modeling-pins, one or two smooth brushes, a sable pen-

cil, moulds for bell-shaped flowers, two or three sizes of wire, the finest of which may be covered with silk and the others with cotton, and a palette will be sufficient for some time. Leaf moulds may be bought, but the impression can be as readily taken from the natural leaf by pressing the wax firmly upon it. With the exception of those which are finely serrated, such as rose leaves, etc., and for these as well as the others, if desired, moulds can be made by simply dipping them into melted wax two or three times and cooling, pouring it several times over the face of the leaf, so that a thick coating is formed on that side only; place it in cold water to harden for some minutes, then, with a knife, cut around the edge of the under part, removing both it and the leaf. Trim off any rough edges remaining on the thick portion and the mould will be ready. For the flowers, two or three nearly alike as possible should be selected—one to be picked to pieces for the various sizes of petals, and the other for reference as to form and color. In cutting out the shape of the petals, use stiff, white paper, keeping true to the outline, except at the base, where it may be cut longer. It will be well to mark the patterns with the name of the flower used, and keep them separate to avoid confusion. Only the purest wax should be used, and in coloring be careful that the exact tint is obtained; and do not be content with one or two trials, but be satisfied only when the copy is perfect. For the rest, practice in making and good taste in grouping and arranging, will make as pretty and durable an ornament as any one need wish for who chooses to study with patience this beautiful art.

MRS. W. J. DAVIDSON.

## FLORICULTURE AS A SCIENCE.

FLORICULTURE has one advantage which many other sciences have not. The most ignorant may follow it, and that, too, on equal terms with the most learned; all can understand the beauty of flowers, nature's best and brightest gift to man. They derive not their value or importance from the distance they come; the place of their nativity has nothing to do with the estimation in which they are held. The new variety raised by the merest tyro is worth as much and will bring as good a price as any equally good flower raised by the veteran hybridiser; and the man who does not know A from V may be just as good a judge as a professor of botany. There is as much perseverance too among the lowly cultivators of fancy flowers as among those whose means are unlimited—yes, and frequently much more. Where the laborer or mechanic once takes to his garden that is the place to find him in all seasons of relaxation; his leisure hours if he were not there could not be spent better, and might not be spent so well.

The exhibition of flowers for premiums is one of the means by which the perseverance of the grower is encouraged, and success on such occasions is one of the means by which his labor is sweetened and his love of plants increased. There is nothing like emulation; to create this is the grand secret of making labor sweet. The man who, in his ordinary occupation, would feel miserable with a wet foot, has been known to stand half way up in water to catch a trout, or walk for hours in wet grass to shoot a few quail or woodcock. In the one case, inconvenience is uppermost because there is no exercise of the mind, and a man has nothing to do but feel; in the other, the body is completely subservient to the grand object in view—heat, cold, wet and fatigue are alike unimportant while an object which engrosses the attention directs the steps.

How many will be found who will labor like slaves for their own pleasure, but who would think a quarter of the exertion a trouble in the absence of a motive, or if enforced by others. Boating, hunting, base ball, shooting, angling, etc., would be only so many modes of annoying men if they were enforced by a superior power instead of led by their own fancy to voluntary toil; and as man looks for relaxation in some sport or fancy or occupation unlike his usual labor or pursuit, happy must it be for the family of that man who finds all he requires in the garden. Well may clergymen take an interest in floriculture, for they can forward their own missions by encouraging it among their neighbors. He who cultivates flowers has the wonders of creation perpetually before his eyes or under his notice; his avocation is sweetened by the variety and beauty of the production he delights in.

Benevolence itself approves the fancy which tortures no living thing, which improves the health, calms the passions, sweetens labor, and forms an inexhaustible store of pleasure without injuring a human being or harming an animal. It is this which places floriculture above all other sources of pleasure; it is this which makes it a favorite science with clergymen and philanthropists; it is this which, when the wealthy of our land once sees its importance, will make them voluntarily support societies for its encouragement from Massachusetts to Nebraska, from Maine to Florida.

## ENGLISH NAMES OF WILD FLOWERS AND PLANTS.

(CONTINUED.)

FRENCH NAMES.

I CAN find comparatively few names of plants or fruits which we have borrowed from the French. Dandelion is, of course, the lion's tooth. Mignonette is applied by us to a very different plant from that which bears the name in France. Woodruffe, known to travelers in Germany as flavoring the pleasant drink called *matrank*, takes its last syllable from *roue*, a wheel, its verticillate leaves being set like a wheel or rowell on the stem. Pansy is *pensee*, thought, from its significance in the language of flowers: "There's Pansy," says Ophelia, "that's for thoughts." Gilliflower is *giroflee*, from *caryophyllum*, a Clove, a name originally given to the

Carnation, but now transferred to the Wall-flower. Tutsan is *toute-saine*, the oil in its leaves having made it a remedy for wounds. Most curious of all is Apricot, from *abricot*, which at one time I contentedly referred to the Latin *apricus*, sunny, ripening, as it does, on sunny walls. It is, in fact, traceable to the Latin *præcox*, early, the fruit being supposed by the Romans to be an early Peach. The Arabs took the Latin name and twisted it into *al barjuk*; the Spaniards altered its Moorish name into *albaricoque*; the Italians reproduced it as *albicocco*, the French as *abricot*, and we get it next in England curiously enough as Apricock, so spelled in Shakespeare's time, and finally as Apricot.

#### LEGENDARY NAMES.

Many curious bits of myth and history reveal themselves as we excavate down to these old meanings. The Poony, or healing-plant, commemorates the Homeric god Peon, the first physician of the gods, who tended the bellowing Ares when smarting from the spear of Diomed. The Centaury is the plant with which the centaur Chiron saved the wound inflicted by the poisoned arrow of Hercules. The Ambross or Wormwood, is the immortal food which Venus gave to Aeneas, and Jupiter to Psyche—the Sanskrit *amrita* which Kehama and Kalyal quaff in Southey's splendid poem. The Anemone, or Wind-flower, sprang from the tears wept by Venus over the body of Adonis, as the rose sprang from his blood.

*Atma rodon tiketi, ta de dakrua lai anemomian.*

The Daphne, Syringa, and Andromeda tell their own tales. The last, which you may find in the pea-blossom round Shapwick station, is due to the delicate fancy of Linnaeus, who first discovered and named it, blooming lonely on a barren, rocky isle, like the daughter of Cepheus, chained to her sea-washed cliff. The Juno Rose, or tall, white Lily, was blanched by milk which fell from the bosom of Juno, the tale being transferred in Roman Catholic mythology to the Virgin Mary and the Milk-Thistle. The yellow Carline Thistle is named after Carl the Great (in Mr. Freeman's county I must not call him Charlemagne), who, praying earnestly for the removal of a pestilence which had broken out in his army, saw in a vision an angel pointing out this plant as a heaven-sent cure. The Herb Robert healed a disease endured by Robert, Duke of Normandy, still known in Germany as *Ruprecht's plague*. The Filbert, though this is disputed, commemorates the horticultural skill of one King Philibert. The Treacle Mustard, a showy crucifer resembling Wallflower, was an ingredient in the famous Venice treacle, compounded, as you will remember, by Wayland Smith to treat the poison sickness of the Duke of Sussex. The word treacle is corrupted from the Greek *theriacum*, connected with wild beasts, whose blood formed part of the antidote. It was at first made up by the physician to Mithridates, King of Pontus, and is still in many parts of England known as Mithridate Mustard. The Flower-de-luce, or *fleur-de-lys*, is the flower of King Louis, having been assumed as a royal device by Louis VII. of France, though legend figures it on a shield brought down from Heaven to Clovis when fighting against the Saracens. It is probably a white Iris.

Not a few strange superstitions and beliefs are embalmed in well-known names. The Celandine, from *cheldion*, the swallow, exudes a yellow juice, which, applied by the old birds to the eyes of young swallows, who are born blind, or have lost their sight, at once restores it. The Hawk-weed has the same virtue in the case of hawks. The Fumitory, *fumeterre*, was produced without seed by smoke or vapor rising from the ground. The Devil's-bit is a common Scabious, with a promorse or shortened root, which was used so successfully for all manner of diseases, that the devil spitefully bit it off, and for ever checked its growth. The Eyebright, or *euphrasy*, was given to cure ophthalmia.

"Michael from Adam's eyes the film removed,  
Then purged with euphrasy and rue  
The visual nerve, for he had much to see."

The Judas-tree, with its thorn and pink blossoms, was the tree on which Judas hanged himself. The Mandrake gathered round itself a host of wild credulities. It was the Atropa Mandragora, a plant nearly allied to the deadly Nightshade, but with a large forked tuber, resembling the human form. Hence it was held to remove sterility, a belief shared by Rachel in the Book of Genesis, and was sold for high prices in the middle ages with this idea. In fact, the demand being greater than the supply, the dealer used to cut the large roots of the White Bryony into the figure of a man, and insert grains of Wheat or Millet in the head and face, which soon sprouted and grew, producing the semblance of hair and beard. These monstrosities fetched in Italy as much as thirty gold ducats, and were sold largely, as Sir T. Brown tells us, in our own country. It was thought that the plant would only grow beneath a murderer's gibbet, being nursed by the fat which fell from his decaying body; hence it formed an ingredient in the love-philtres and other hell-broths of witches, and, as it was believed that the root when torn from the earth emitted a shriek which brought death to those who heard it, all manner of terrible devices were invented to obtain it. The readers of Thalaba will remember the fine scene in which the witch Khawla procures the plant to form part of the waxen figure of the Destroyer. I have seen the plant growing in the Cambridge Botanical Gardens; it is not uncommon in Crete and Southern Italy; its fruit is narcotic, and its name is probably derived from *mandra*, an enclosed, overgrown place, such as forms its usual home.—*Nature*.

#### COLONIZATION IN FLORIDA.

OFFICE OF THE NASSAU CO-OPERATIVE COLONY OF FLORIDA, 35 Bayard Street, New York.

Hearing that numerous inquiries have been addressed to your journal in regard to colonies organized for settlement in Florida, I have taken the liberty of inviting your attention to the prospectus of the Nassau Co-operative Colony. We have selected a tract of land, about twelve miles from Fernandina, on which we propose to locate a colony of determined and skilled workers, both agricultural and mechanical. The tract is well adapted for the end in view, being extremely healthy. The soil is as good as any in Florida, and from the abundance of cypress and other timber, could be utilized in the various branches of mechanical enterprises.

There are many places open for settlement, but care should be taken to select those that offer the quickest as well as the best return for the labor and limited capital of the worker. A few facts are presented by Florida offers greater inducements—immediate and prospective—than other States do:

1. The army statistics show it to be the healthiest State in the Union, and Northern people have become to consider it the Sanitarium of the United States.

2. Every month in the year vegetables can be grown in the average soil of any county in the State. Thus there need be no anxiety in regard to having plenty to eat if one will work for it. In the spring of

each year vegetables can be grown and placed in northern markets at prices that will pay a handsome profit. In the fall of the same year a crop of sugar cane can be raised that will pay equally well. Thus they have for their labor a greater return than can be gained elsewhere in any agricultural district of older States.

Fruits in time can be made to pay, but poor people should not build too much on that prospective interest. By skillful care and management they can be made to pay, but fruit raising requires persistent and well-directed labor.

Respectfully yours, etc.,

CHAS. H. FENTON, President.

**HINTS ON HYACINTHS.**—Avoid late planting, which is fatal to success, however large and matured the bulbs may be. A successful bloom from Hyacinths invariably depends upon obtaining a slow and mature formation of the root-fibres before the leaf growth, either in the dark recesses of a room, for glass culture, or by coverings of soil in garden borders for pot culture. Where cool and dark recesses are not at hand, the glasses may be heavily screened from light by sheets of paper; or some similar means. Never place the glasses upon a mantel-piece or shelf within the influence of fire heat during the process of growth. Avoid a low water mark in the glasses by keeping it to a level with the base of each bulb. To insure vigorous growth and good bloom, the most favorable exposure to sunlight, and occasional fresh air when mild, are essential. All extremes of temperature should be avoided, and for the earliest blooms, more especially in severe weather, the glasses should be removed nightly to a side table until morning, and then replaced. To stimulate and strengthen the growth, dissolve a pinch of sulphate of ammonia occasionally in the water after the bulbs are exposed to the light.

—When in classical times a man had done some great thing, he was honored with a public triumph, a wreath of laurel or of oaks. Now he is at all events honored with the esteem and regard of others. We are right by honoring the inventor of B. T. Babbitt's Toilet Soap, whose past achievements have reached a fitting complement in the new toilet soap, which is simply the greatest luxury and comfort possible to man. Pure and honest, it can be absolutely trusted as the best thing in use. —*Adv.*

### Sea and River Fishing.

#### FISH IN SEASON IN NOVEMBER.

Black Bass, *Micropterus salmoides*; Weakfish, *Cynoscion regalis*.  
Bluefish, *Pomatomus saltatrix*.  
Spanish Mackerel, *Scomber maculatus*.  
Mascalonge, *Esox nubilus*.  
Pike or Pickerel, *Esox lucius*.  
Yellow Perch, *Perca flavescens*.  
See Bass, *Sciaenops ocellatus*.  
Striped Bass, *Morone linnetus*.  
White Perch, *Morone americana*.  
Brook Trout, *Salvelinus fontinalis*.  
Kingfish, *Menticirrhus nebulosus*.

**FISH IN MARKET.**—Fish in fair quantity. Bass, 20 cents; smelts, 25 cents; bluefish, 15 cents; salmon frozen, 35 cents; mackerel, 15 to 25 cents; green turtle, 15 cents; terrapin, \$18 per dozen; halibut, 18 cents; codfish, 6 to 8 cents; blackfish, 15 cents; flounders, 12 cents; eels, 18 cents; lobsters, 10 to 12 cents; sheephead, 25 cents; scollops, \$1.50 per gallon; soft clams, 30 to 60 cents per hundred; whitefish, 16 cents; salmon trout, 18 cents; mascalonge, 18 cents; hard crabs, \$2.50 per hundred.

—On the 19th of this month a fine large roe shad was caught at Peekskill on the Hudson, and was exhibited by Mr. E. G. Blackford, in Fulton Market. Such incidents are phenomenal, and may be regarded as freaks of nature.

**MOVEMENTS OF THE FISHING FLEET.**—The arrivals for the past week have been principally confined to the Banks and Bay fleets, the vessels detained so long at Canso by unfavorable winds having put in an appearance and landed their fares. The number of arrivals from the Bay since our last issue has been 12, and the receipts 1,550 barrels. The stock has nearly all been taken, and the market is firmer. The Shore fleet are nearly all in, and the season about closed. Forty vessels, including a few from Gloucester, were reported off Cape Cod on Wednesday morning, taking mackerel. There have been eight arrivals this week. The Bank fleet make short trips, and mostly have light stocks. Twenty-eight arrivals have been reported the past week, bringing 445,000 lbs. codfish and 275,000 lbs. halibut. The number of arrivals from Georges has been nine, and the receipts 90,000 lbs. codfish. Total number of fishing arrivals for the week fifty-seven.—*Cape Ann Advertiser*, Nov. 16.

**ARCTIC WHALING FLEET.**—Eleven ships of the Arctic whaling fleet took the risk of remaining in that ocean late in the season and, after Oct. 1st, caught 73 whales. This catch is nearly twice as large as all the previous capture of the fleet for the season. The twenty ships previous to October had only taken 44.

**LIKE EAT LIKE.**—A bass was taken recently in the Juniata which was found to contain a young muskrat weighing a half pound. During the recent passage of 150 bass from Centre to Clearfield County, two of them ejected two field mice. Lamm, in his work on fishing, speaks of capturing a very large trout with a live mouse, which he tied to his line just above the hook and allowed the little rodent to swim on the surface of an extensive pool. This experiment was resorted to only after all other bait had failed to take the noble fish.—*German-ton Telegraph*.

Black bass and trout have an hereditary grudge against the field mouse and muskrat, both of which feed largely upon their spawn. We are not prepared to admit that the fish swallow the rodents so much because they love them as to retaliate in kind for their depredations upon their embryo kindred, though, possibly, a proper young field mouse, purile and tender, makes an attractive bait.—*Ed. F. & S.*

**TO VARNISH A FISHING ROD.**—*Land and Water* gives these directions for varnishing a rod: "Half a pint of linseed oil and a little India-rubber scraped fine; put them over a slow fire and stir them until the rubber is dissolved; then boil and skim it; apply it warm, and do not use the rod till quite dry. The appearance upon the rod will be like a fine, thin bark; it will preserve the rod from being worm-eaten, and from other injuries, and is very durable." Another way: "Take two ounces of caoutchouc and pare it into thin slices; then heat

an iron ladle, such as plumbers use, until it is so warm that a piece of the caoutchouc being thrown into it will evaporate in a white smoke (if it emits a black smoke and burns, it is too warm); then put in all the India-rubber, or caoutchouc, and when it is melted add a pint of drying oil, and keep stirring it until the oil is thoroughly warm. When cold strain it and lay it by for use. It may be used either warm or cold. Linseed oil, into which a few drops of neatfoot oil has been put, which has lain in a lump of roach lime, to make it dry soon, will answer as well as boiled oil."

**A BALTIMORE FISH STORY.**—This is from Baltimore. Captain Johnson, of the *Tecumseh*, goes fishing for business, and this is what happens to him. Off Bodkin Creek he lets go his line for perch. In twenty minutes he hooks thirty perch. Presently Captain J. got a strong bite and he pulled. It was so heavy a fish that the skipper had to play his catch. Up came a rock perch; but just as the fish was out of the water a pike made for that perch, and swallowed perch, hook, line and all. Hitting a half-inch rope to the line, and giving it a turn around the capstan, at last the double catch was landed. In the pike's stomach there was found an English penny of the date of 1803, and a brass button. As the captain is fishing off Bodkin Creek, mysterious disappearances in the neighborhood should be looked up. Maybe a tailor committed suicide there at the beginning of this century? The brass button makes us think it quite possible.

### The Kennel.

TO CORRESPONDENTS.—Those desiring us to prescribe for their dogs will please take note of and describe the following points in each animal:

1. Age. 2. Food and medicine given. 3. Appearance of the eye, of the coat; of the tongue and lips. 4. Any changes in the appearance of the body, as bloating, drawing in of the flanks, etc. 5. Breathing, the number of respirations per minute, and whether labored or not. 6. Condition of the bowels and secretions of the kidneys, color, etc. 7. Appetite; regular, variable, etc. 8. Temperature of the body as indicated by the bulb of the thermometer when placed between the legs, and the foreleg. 9. Give position of kennel and surroundings, outside, contiguity to other buildings, and the uses of the latter. Also give any peculiarities of temperament, movements, etc., that may be noted signs of suffering, etc.

#### THE TENNESSEE FIELD TRIALS AT NASHVILLE.

On Thursday evening last terminated the fourth annual field trials of the Tennessee State Sportsman's Association. What with the admirable and liberal management of Mr. Kirkman, the president, and of Mr. Pritchitt, the secretary of the association, and the almost limitless ranges of the Belle Mead estate, so generously placed at the disposal of the association by General Harding, these trials for the year 1877 were by far the most interesting yet held in this country.

As you have already published a list of the entries for the trials, it only remains to give your readers a list of the winners without encumbering your crowded columns with tedious and tedious details of the contest, the official report of which is appended, signed by Mr. Pritchitt, the wide awake and efficient secretary of the association.

#### THOUGHTS SUGGESTED BY THE FIELD TRIALS.

Of course the object of all field trials is to test the powers of the contesting dogs in the field, and accordingly the rules for their conduct are established with a view to exclude the element of chance and enable the best dog to win without regard to chance; but that fickle jade, Fortune, will intrude herself as canine as well as human affairs, and through her meddling in this occasion was established the truth of the old Scottish maxim that "the battle is not always to the strong nor the race to the swift." Ergo, in field trials we cannot be sure that the best dog will win. Another thought. It is an old adage that "the winning horse or dog is of the best color." Now it is evident to all who witnessed them that the field trials at Belle Mead utterly destroyed, at least as regards dogs, the truth of this old adage; for in the rank cover of that exuberant red dogs and all others of a neutral color were almost as visible when contending with their rivals of more distinctive coats—the white and black and the all black. Hence it is to draw the conclusion that in selecting a dog, color is next in importance to nose and action.

Again: the professional breakers of setters and pointers who aspire to achieve a reputation at these trials, will naturally train their pupils to conform to the rules under which the trials are held, and of course, under such training, the most timid puppies acquire, under dread of the lash or spiked collar, an over-cautious sneaking action, which savors not at all of the contemptible; a gallant, bold, free ranging dog will flush more birds than his competitor trained especially to win at a field trial, but in the long run he will find more birds in a style more pleasing to a gentleman than to a mercenary hunter.

What added immensely to the interest of the late trials was the rivalry between the native and the imported—so-called blue blooded dogs. A well-known writer on dogs, an American, and an importer of some good English dogs, was so discreet as to denounce our native setters and pointers as mongrels. This was like setting fire to a powder magazine. A tremendous explosion ensued, and a feud has grown out of as virulent as that between the Capulets and the Montagues. Smith, of Strathroy, backed by the gallant, indefatigable and irrepressible "Mohawk," led the van of the blue bloods. Confronting them stood the stalwart Memphian "Gent" with those tall sons of "Anack" and Tennessee, the "Bells of Maury, on his right and his left. But we will

field sports must be neutral in such a feud, and if it be not an indiscretion on the part of your reporter, he will exclaim with the gallant and gay Mercutio, "A plague on both your houses!"

But as an impartial reporter, I must say as Secretary Pritchett's report will prove, that in the late trials the Strathroy Kennel carried off if not all, yet enough laurels to make it the victor of the hour, but it was a hard won victory, and, therefore, the more glorious.

# BELLE MEAD.

If you had not an agricultural department in your paper, I might be afraid to confess that I took more interest in the field of the trials than in the trials themselves, which though exceedingly interesting when first-class dogs were carrying over grass and stubble with the speed, courage and grace which high breeding and perfect form alone can give, were rather stupid when the "plugs" were down, creeping with snake-like timidity inspired by the fear of the trainer's lash or the cruel spiked collar.

The fine mansion of Belle Mead stands on a gentle elevation in the centre of four thousand acres of as fine land as ever responded with bountiful harvests to the genial influences of a Southern sun. Surrounded by its numerous offices, its lawns bursting with golden grain, its mountainous ricks of hay and straw, and its stables filled with fifty thoroughbreds, all with pedigrees without a flaw, it resembles one of those ancient feudal manor houses of old Europe, under whose protecting shadow are gathered the humbler dwellings of the vassals of the estate; while the cordial and profuse hospitality of the venerable and patriarchal owner, General Harding, and his gallant son-in-law, General Wm. H. Jackson, was a vivid reminder of what a first-class Southern plantation was in the ante-bellum days.

To the right of the mansion is a vast park, covered with majestic primeval trees, yet clad in the golden glories of their autumnal garb, beneath whose shade herds of native deer may be seen cropping the succulent blue grass, or in graceful play; while here and there may be seen the antlered monarchs of the herd standing like sentinels guarding the more timid does. To the south, far away over the vast intervening pastures dotted in every direction with sleek Durham and Jersey and grade cattle, and the picturesque southern sheep, may be described the vivid green of the prairie-like meadow extending to the foot of the distant hills which bound the view in that direction. West and north, as far as the eye can reach, and beyond, woodlands ankle-deep in blue grass, alternate with cultivated fields, through all of which meander sparkling brooks, which make music as they ripple over the shelving lime-stone rocks. And surrounding this magnificent body of fertile land, as if to hold it in a loving embrace, are hills of gentle slope and picturesque outline, clad from base to summit with towering trees, all resplendent with the varied and gorgeous tints of the autumnal season.

F. G. S.

## LIST OF WINNERS.

HEADQUARTERS TENNESSEE STATE SPORTSMAN'S ASS'N.  
NASHVILLE, TENN., Nov. 18, 1877.

### COL. SKINNER:

Dear Sir:—I have the honor to submit the following as a summary of the result of the Nashville Field trials of 1877.

PUPPY STAKES UNDER EIGHTEEN MONTHS OLD.—First prize, Gladstone, score, 64½; second, Champ, 62½; third, Ida, 50½. Mr. J. H. Dew awarded premium as best trainer.

CHAMPION STAKES.—First prize, Joe, Jr., score, 62½; second, Pride of the South, 58½; third, Countess and Nellie, Tie, 57½. Mr. Sanborn awarded premium as best trainer.

DUPONT POWDER CO.'S BRACE STAKE.—First, Clip and Pride, score, 66; second, Buck Jr. and Joe, Jr., 52; third, Gladstone and Whip, 51. J. H. Dew awarded premium as best trainer.

ST. LOUIS KENNEL CLUB STAKE.—Premium Cup, value, \$50, awarded to Hill.

H. C. Pritchett, Sec'y.

### ENTREES NASHVILLE FIELD TRIALS.

PUPPY STAKES.—W W Tucker, Kitten, by Plunkett—Bierbow, Kitty; Dr J Fleet Spier, St Elmo, by Pride of the Border—Herzberg, Jessie; John Davidson, Afton, by Adams Rock—Flora II; St Louis Kennel Club, Berkeley, by Elcho—Loo II; St Louis Kennel Club, Biddy, by Erin—Erin; J H Dew, Floss, by Dog-Whip—Fanny Keen; P H Bryson, Gladstone, by Llewellyn's Dan—Petrel; D Bryson, King, by Plunkett—Bierbow, Kitty; G W Campbell, Ida Jr, by Erin—Ida; J K Hughes, Skip, by Dog-Whip—Daisy Deau; W W Tucker, Champ, by Jep—Flounce.

CHAMPION STAKES.—W A Wheatley (W W Tucker), Flirt, by Pilot—Flounce; W A Wheatley, Countess, by Joe—Kate; V L Kirkman, Tom Jr, by Tom—Buck Jr; G W Campbell, Buck Jr, by Joe—Buck Jr; G W Campbell, Joe Jr, by Elcho—Buck Jr; L R Morris, Mag, no pedigree given; George C Colburn, Sank, by One-Eyed Saucy—Colburn's Kate; Alfred Jenkins, Hela, by Colburn Dash—Gills Nellie; L H Smith, Clip, by Leicester—Dart; D C Sanborn, Nellie, by Belton—Dimple; Dr J Fleet Spier, St Elmo, by Pride of the Border—Jessie; Capt Patrick Henry, Pride of the South, by Leicester—Dart; P H Bryson, Gladstone, by Dan—Petrel; P H Bryson, Dog Whip, by Rake—Dart; Dr J Fleet Spier, Spiero, no pedigree given; D Bryson, King, by Plunkett—Kitty; John Davidson, Chester, by Importer—Samuel—Belle; St Louis Kennel Club, Thelstein, by Erwin's Druid—Erwin, Peggy; St Louis Kennel Club, Berkeley, by Elcho—Loo II; G W Campbell, Floss, by Elcho—Buck Jr.

DUPONT POWDER (BRACE) STAKES.—W A Wheatley enters Flirt and Countess; Dr Fleet Spier enters St Elmo and Spiero; V L Kirkman enters Tom Jr and Floss; G W Campbell enters Buck Jr and Joe Jr; L R Morris enters Mag and Dash; Geo C Colburn enters Sank and Hela; L H Smith enters Clip and Pride of the South; P H Bryson enters Dog Whip and Gladstone; St Louis Kennel Club enters Thorstein and Berkeley.

ST. LOUIS KENNEL CLUB STAKES.—John Davidson, Tyne, by Chester—Flora II; W W Tucker, Champ, by Jep—Flounce; J K Hughes, Skip, by Dog Whip—Daisy Deane; J H Dew, Bill, by Dog Whip—Fanny Keen.

### ORDER OF RUNNING.

PUPPY STAKES.—J H Dew, Floss; W W Tucker, Kitten; J K Hughes, Skip; St Louis Kennel Club, Berkeley; P H Bryson, Gladstone; John Davidson, Afton; Geo W Campbell, Ida; D Bryson, King; W W Tucker, Thelstein; Dr J Fleet Spier, St Elmo; St Louis Kennel Club, Biddy.

CHAMPION STAKES.—D C Sanborn, Nellie; Alfred Jenkins, Hela; Geo W Campbell, Joe Jr; W A Wheatley, Countess; P H Bryson,

Dog Whip; L H Smith, Clip; W A Wheatley, Flirt; Geo C Colburn, Sank; John Davidson, Chester; Dr J Fleet Spier, St Elmo; L R Morris, Mag; P H Bryson, Gladstone; V L Kirkman, Tom Jr; Capt Patrick Henry, Pride of the South; D Bryson, King; G W Campbell, Buck Jr; St Louis Kennel Club, Berkeley; G W Campbell, Floss; Dr J Fleet Spier, Spiero; St Louis Kennel Club, Thorstein.

BRACE STAKES.—P H Bryson, Gladstone and Dog Whip; St Louis Kennel Club, Thorstein and Berkeley; L R Morris, Mag and Dash; Dr J Fleet Spier, St Elmo and Spiero; V L Kirkman, Tom Jr and Floss; W A Wheatley, Flirt and Countess; Geo C Colburn, Sank and Hela; L H Smith, Clip and Pride of the South; Geo W Campbell, Buck Jr and Joe Jr.

ST. LOUIS KENNEL CLUB STAKES.—W W Tucker, Champ; J H Dew, Bill; J Kemp Hughes, Skip; Jno Davidson, Tyne.

## PACIFIC COAST BENCH SHOW.

We give a list of the winning dogs at the Pacific Coast Bench Show. Our correspondent comments on the peculiar beauty of the native greyhounds:

CLASS A.—Imported Greyhounds—R O Sanley's Lady Bessie, gold medal; D W White's Lady Jones, silver medal; B F Wright's dog Quicksilver, silver cup.

CLASS B.—Native Greyhounds—P J Jacoby's Zadie, gold medal; Ch Fowler's Lady Silver, gold medal; D W White's Sontar Johnny, silver medal; John Searle's Lady Belle, silver medal; Thomas Tunstead's White Cloud, gold medal; N Curry's litter of puppies (4 dogs, 3 bitches), puppy prize.

CLASS C.—Native English Setters or Cross-bred, with or without pedigree—William McBrien's Blanche, gold medal; Harry Akers' Fanny, gold medal; Robert A Hunter's lemon and white dog Sport, gold medal; T F Murphy's Puleh, silver medal; Fred Sierp Jr's dog Dan, first prize, silver cup; James Sumner's dog Snow, silver medal.

CLASS D.—Imported Red or Red and White Setters, either Irish or cross-bred—L J Vilegia's Prince, silver medal; G W Shorten's dog Sam, silver cup; M Ryan's Sam, silver medal.

CLASS E.—Native Red or Red and White Setters—John F Lohse's Sport, gold medal; A C Titcomb's Sam, silver medal; C G Toland's Whiskey, bronze medal; C G Toland's Dick, bronze medal.

CLASS F.—Gordon, or Black-and-Tan Setters—John L Meares, Jr's, Prince, silver medal; Henry Babcock's Grouser, silver medal; H Toland's Shot, bronze medal; H A Mayhew's Shot, silver cup.

CLASS G.—Pointers (of 50 pounds weight or over)—Charles C Cadman's dog Roi, silver cup; F X Van de Casteel's Belle, silver cup; J M Betz's Sport, bronze medal.

CLASS H.—Native Pointers—Caspar Becker's bitch Belle, gold medal; F Sauerbreys's Hector, silver medal; Caspar Becker's Flock, bronze medal.

CLASS I.—Pointers (puppies)—J S Arnheim's Victoria, silver medal; John McCallum's Prince, silver medal.

CLASS J.—Retrieving and Field Spaniels—J Shrogg's Junior, silver medal, special premium for retrievers; J L Johnson's dog Jack, silver medal, special premium for retrievers; Jno Stack's bitch Fanny, silver medal; H A Smith's dog Duke, silver medal; Frank Trevor's Kate, bronze medal; T F William's dog Brutus, bronze medal.

CLASS K.—Cocker Spaniels—C Coates' Leo, silver medal; C Coates' Daisy, bronze medal.

CLASS L.—Foxhounds—J W Orndorff's Josh, gold medal; J Zaunmiller's Beauty, silver medal; John Connolly's dog Jim, silver medal; Jacob Grogg's Half, bronze medal.

CLASS M.—Fox Terriers—No prizes.

CLASS N.—Mastiffs—O A Hickox's dog Sultan, gold medal; Geo W Smiley's bitch Nell, gold medal.

CLASS O.—St Bernards—D Vennekohl's Carlo, gold medal; Henry B Wade's Carlo, silver medal; N Cremer's Fipgal, bronze medal.

CLASS P.—Newfoundlands—M Wise's Major, gold medal; Mrs. Valley's dog Jack, silver medal; T Evans' Rover, bronze medal.

CLASS Q.—Dalmatians, or Coach Dogs—Ben E Harris' King, gold medal; Fred N Nobman's litter of puppies, silver medal.

CLASS R.—Borough dogs (for sale), silver medal.

CLASS S.—Shepherd Dogs or Collies—No prize.

CLASS T.—Italian Greyhounds—Dr J C Leonard's Lonie, silver medal; James L Fink's litter of puppies, silver medal; James L Fink's Nellie, bronze medal.

CLASS U.—Bulldogs—Frank Dietterle's Rattler, gold medal; John Neary's Nellie, silver medal; Thomas Neary's Blucher, silver medal.

CLASS V.—Bull Terriers—Joe McLaughlin's Ike, gold medal; John F Carroll's Molly, silver medal; Chas Horner's Nero, silver medal.

CLASS W.—Blenheim and King Charles Spaniels—William N B Lawton's Daisy, gold medal; E E Caswell's Tom, silver medal.

CLASS X.—Poodles—Linda Jeal's Carrie, gold medal.

CLASS Y.—Bloodhounds—L P O'Neill's Buck, silver medal; W Boger's bitch Bella, silver medal.

CLASS Z.—Pugs—Mrs Geo J Wright's Duchess Judy, gold medal; J E Tyler's Nelson, special prize.

CLASS 30.—Black-and-Tan Terriers—E Flaherty's dog Henry, gold medal; Joseph Franklin's Nettie, silver medal; S H Brooke's litter of puppies, silver medal; Louis Prevot's Big Pete, bronze medal.

CLASS 31.—Black-and-Tan Toy Terriers—Mrs Franklin's Gipsy, gold medal; F W Sierp's Brnothe, silver medal; Mrs Poole's Flitane, silver medal; Louis Prevot's L Pete, bronze medal.

CLASS 32.—Skye Terriers—James Riley's Sam, gold medal; B Orndenstein's Toots, silver medal.

CLASS 33.—Yorkshire Terriers—Joseph Franklin's Havelock, gold medal; Joseph Franklin's Jessie, silver medal; Thomas Candler's Rosa, special prize; Joseph Franklin's Sally, special prize.

CLASS 34.—Dandie Dinmonts—W Davidson's Maggie, gold medal; S Franklin's Pat Rooney, silver medal.

CLASS 35.—Silver Skye and Blue Skye Terriers—L P O'Neill's Juddies, gold medal.

CLASS 36.—Scott Terriers—T F Carroll's Scottie, gold medal; J H McMenomy's Tatters, silver medal.

GRAND INTERNATIONAL DOG SHOW AT PHILADELPHIA.—We have every reason to suppose that the Philadelphia dog show will be an excellent one. Mr. Thatcher Goddard has been indefatigable in inducing gentlemen both in Philadelphia and in other cities to send their choicest animals. We are pleased to mention that so far over 300 entries have been made. In addition to the regular prizes, amounting to some thirteen hundred dollars, purchased by Bailey & Co., the following special prizes have been added:

### SPECIAL PRIZES.

1. For the best stud pointer with two of his get, over six months old, a "solid silver pitcher," valued at \$175; presented by Mr. Thomas W. Sparks, of Philadelphia.
2. For the best setter on exhibition, a painting from the easel of Mr. James B. Sward and presented by him; valued at \$100.
3. For the best native setter dog over one year of age, barring champions, a silver fruit dish, valued at \$100; presented by members of the Philadelphia Sportsmen's Club.
4. For the best pointer, having the dog that takes Mr. Sparks' prize, a silver pitcher, valued at \$75; presented by Mr. Joseph T. Bailey, 12th and Chestnut streets, Philadelphia.
5. For the best Skye terrier, \$100 cash, from a gentleman of Philadelphia.

6. For the best pointer dog, barring champions, a silver fruit dish, valued at \$75; from gentlemen of the Philadelphia Sportsmen's Club.

7. For the best pointer over fifty pounds, excluding champions, a piece of silver, valued at \$35, from the Continental Hotel.

8. For the best cocker spaniel, a case of game birds, valued at \$40; from Mr. John Krider, of Philadelphia.

9. For the best stud setter with two of his get, over six months old, a revolver and case, valued at \$90; from J. C. Grubb & Co., of Philadelphia.

10. For the best pointer under fifty pounds; a Colt's revolver and case, valued at \$95; from Edward Anschutz, of Philadelphia.

11. For the best three couples of fox-hounds from one kennel, a piece of silver, valued at \$25; from Mr. Thatcher Goddard.

12. For the best beagle, an Adams revolver, valued at \$25; from Mr. Mahlon Barnes, of Philadelphia.

The exhibition will be held at Horticultural Hall, commencing on the 26th of November, will close on the 20th.

DOG TRANSPORTATION TO PHILADELPHIA.—We are pleased to inform gentlemen desirous of forwarding their dogs to the Philadelphia Dog Show, that the Bound Brook R. R. Co. will transport all dogs intended for exhibition free. The animals must be attended by some one in charge. Trains leave foot of Liberty street 6:30 A. M., 8 A. M., 11:30 A. M., 1:30 P. M., 3:30 P. M., 4 P. M., 5:30 P. M. and at midnight. The best of accommodation will be provided for the dogs.

—We have received a fine photograph of "Elcho," a superb setter, the property of Mr. H. Jarvis. Elcho is three years old. As his name shows, this fine animal perpetuates the Elcho Shield and rifle reminiscences, the dam and sire of the dog having been bred by Mr. W. Rigby, of Dublin. The strain comes direct from Lord Waterford's stock, and from animals in the Marquis of Ormond's kennels. "Elcho" has won prizes in Dublin, Chicago, St. Louis, Baltimore, New York and Boston.

—We have the photograph of Mr. Doane's Gordon setter "Tom," who was winner of the first prize at Boston a couple of months ago. This fine animal is the progeny of "Fly" and "Dash." The picture is a very good one—a masterpiece of photographic art.

NAME CLAIMED.—The name of "Fame" is claimed for the white and liver setter dog, whelped Sept., 1876, by Mr. C. H. Raymond's "Bride of the Border" out of Mr. D. Olcott's "Flash." "Fame" is owned by Messrs. Charles De Rouge and H. Inman, and will be exhibited at the Philadelphia show.

New Dorp, S. I., Nov. 17.—Mr. M. A. Galloway claims the name of "Man" for red Irish and Gordon pup, out of Welsh's "Killarney," by McCormack's "Mac." Mr. Galloway is the owner of "Killarney."

A STORY WITH A MORAL.—Two honest old gentlemen were walking up Chestnut street, talking of the sports of their youth. "Isn't a dog show a new thing, at least, for Philadelphia? Don't you remember Dash?" "Dash!" replied the other old gentleman, "Dash! Bless me, wasn't he a dog? Do you remember right where Germantown now stands, how, in one day, with that dog, we killed sixty partridges? Dash would have beaten any of these new-fashioned dogs. But poor Dash died—forty years ago." Then, to console themselves, the two old gentlemen went to Finelli's in Chestnut street, below Broad, and having partaken of Finelli's miraculously fried oysters, and washed them down with a mug of Smith's old-fashioned ale, the two fine old gentlemen passed a pleasant hour, talking of Dash and the sports of their younger days.

—Capt. John M. Taylor, of Bellefonte, Nottoway County, Virginia, has some idea of starting a pack for coursing hares. He expects to breed from some choice animals of the harrier type for this purpose, and now has some remarkably fine stock to commence with.

—A sanguinary bulldog in the San Francisco dog show became so excited by his surroundings that nobody dared go near him. His food was poked to him with a long stick, and a strong railing was put up to keep spectators at a safe distance. He growled and showed his teeth whenever anybody looked at him, and was generally an object of terror. Consequently the people were horrified when a little girl crawled under the railing, and, approaching the brute, said, coaxingly: "Nice doggy, nice doggy!" Her mother screamed and fainted. A valorous fellow took off his coat and prepared for a rescue. The child coolly patted the dog, saying: "What's the matter, doggy? What makes 'oo growl so?" The dog ferociously fixed his teeth in her dress, and her fearlessness seemed to cow him, and he slunk back from her. She suffered no harm except from the suddenness with which she was yanked out of the enclosure.—New York Sun.

NOTICE TO SPORTSMEN.—Having received so many communications asking us for information in regard to our six-section bamboo trout, black bass, grise and salmon rods, we have prepared a circular on the subject, which we shall take pleasure in forwarding to any address. We keep on hand all grades, the prices of which range from \$15 to \$150. We put our stamp only on the best, in order to protect our customers and our reputation, for we are unwilling to sell a poor rod with a false enamel (made by burning and staining to imitate the genuine article) without letting our customers know just what they are getting.

P. O. Box 1,234.—[Add. ABBEY & IBERIE, 38 Maiden Lane.

—As a jewel wants a casket so ought a gun to be properly cared for in a good case. Though sportsmen should never be separated from their guns, sometimes in traveling the best of friends must part, and then baggage-smashers stop at nothing. For a solid, good and handy gun case we can recommend those made of bridle leather, and manufactured by Messrs. Thomson & Son, of 301 Broadway, N. Y.

# Game Bag and Gun.

## GAME IN SEASON IN NOVEMBER.

Moos, *Alces, machilis*.  
Elk or wapiti, *Cervus canadensis*.  
Hares, brown and gray.  
Wild turkey, *Melagris gallopavo*.  
Woodcock, *Philohela minor*.  
Ruffed grouse, *Houasa umbellus*.  
Plover, *Charadrius*.  
Godwit.  
Rails, *Rallus virginianus*.  
Snipe and Bay Birds.  
Cariboo, *Tarandus rangifer*.

Red Deer, *Cervus virginianus*.  
Squirrels, red, black and gray.  
Quail, *Oxyechus virginianus*.  
Pinnated Grouse, *Cupido cupidoides*.  
Curlew, *Numenius arquaria*.  
Sandpipers, *Tringa*.  
Wilets.  
Reed or Rice Birds, *Dolichonyx orizivorus*.  
Wild Duck.

"Bay birds" generally, including various species of plover, sand piper, snipe, curlew, oyster-catcher, surf birds, phalaropes, avocets etc., coming under the group *Limacola* or Shore Birds.

**FOR CURRITUCK.**—The Currituck Sound boat leaves Norfolk every Monday and Thursday at 6:30 A. M., and on Saturday at 5 A. M. The Saturday boat will be discontinued toward the close of the month.

**CANADA.**—Mr. George M. Fairchild, of this city, has just returned from his annual fall trip to his old sporting grounds at Valcartier, P. Q., Canada. He reports poor success. He found the lakes and rivers all frozen, and almost a foot of snow on the ground. Cariboo are very abundant, and a little later there will be fine sport still-hunting them.

On the cars between Quebec and Montreal he fell in with that genial sportsman and accomplished gentleman, your correspondent "Stansted." He had been down on the Inter Colonies, but reported poor shooting; too much ice. This gentleman is a most clever writer, and has already furnished *FOREST AND STREAM* with some capital letters of his hunting trips north of Quebec.

**NEW HAMPSHIRE.**—Webster, *Mer. Co., Nov. 12.*—During the last two weeks there has been a fair sprinkling of ducks, a few geese, but none to stop. Shrikes, snow buntings, cross-bills and pine finches have made their appearance. Trapping FALCO.

**MASSACHUSETTS.**—Salem, *Nov. 16.*—Quite a flight of geese. 16 were shot yesterday at Essex Ponds; some black ducks are also shot. Some fair bags of quail have been made of late. Marsh birds are done. An occasional snipe may be started, and also ditto for woodcock. W. Newburgh states that ducks are unusually scarce in the Merrimack and Attchokoe Rivers this fall. We have had light spits of snow, and ice quite thick, with ground frozen. TEAL.

—We beg to acknowledge from the Rod and Gun Club, of Springfield, an invitation to partake of their annual game supper, to take place at Hayne's Hotel on the 23d.

**NEW BEDFORD, Nov. 17.**—The shooting season has opened well in this vicinity. Partridges and quail plenty. Also some good shots at woodcock, averaging five and six birds per day to sportsmen with good dogs, who are not afraid to face a thicket of scrub oak and cat briars, even if they come out with shirt and pants hanging in shreds. Black ducks and sea fowl plenty. CONCHA.

**NORTH COHASSET, Nov. 15.**—Season for coot shooting about finished; has been very poor; only four or five days at all good gunning. Last Sunday large flight of geese; thirty-seven killed in three stands. Very singular incident occurred: five young geese decoyed by old gander into yard, and captured without firing a gun. Fair yellow-leg shooting for a week past, and some bags of eight and ten were taken. No woodcock seen this fall. Expect good brant and whistler shooting next week. S. K., Jr.

**RHODE ISLAND.**—Newport, *Nov. 14.*—Shooting not good; wild fowl scarce. Weather too pleasant to allow birds to come much to the shores. T. J. F.

**NEW YORK.**—Hornellsville, *Nov. 19.*—Quail shooting has been very poor. I do not think a dozen have been shot this season. For every quail in the country at least two traps are set. JONK.

**Stratford, Nov. 16.**—Sportsmen may shoot all day at the black ducks, coots, etc., without any intermission of the sport.

**FOX HUNTING IN LIVINGSTON COUNTY.**—The sportsmen of Buffalo have been following the example of their Metropolitan brothers and indulging in the fox hunt.

**Bloomington, Nov. 17.**—Fine sport this week. Miller and myself in three days' shooting bagged four woodcock, two quail and twenty-three partridges. Partridges plenty. MILO.

**Chatham Village, Nov. 19.**—The hunting of ruffed grouse has been very good about here this fall, and the fox hunting is very good. Have been out a few times, and ran with another hunter; we have bagged five old red foxes. We have very nice running hounds, and expect to have some fine runs this winter. W. G. S.

**Syracuse, Nov. 16.**—John H. Mann and his son, E. H. Mann, returned yesterday from a day or two spent on Oneida Lake. They brought in eleven partridge—nice plump specimens as were ever shot—seventeen ducks and one cormorant. Such a bag of game was well worth looking at. The cormorant is very rare in this vicinity. Mr. Mann states that he has seen but one other here in fifteen years. It will be sent to the taxidermist for preservation.

**Syracuse, Nov. 17.**—A large woodcock recently bought at my store weighed 10-16 ounces. It is the largest I ever saw in this country, and beats one that I killed in 1854 weighing 10 ounces. I also bought a Wilson snipe this season that weighed 6-16 ounces. I have record of other snipe killed at different times weighing 6 and 6½ ounces. Have you any record of either woodcock or snipe weighing over these weights? I have weights of ruffed grouse, rabbits, etc., that I could furnish if of any interest to your readers. J. H. M.

**Kingston, N. Y., Nov. 14.**—Partridge are very plenty in this section this fall, and selling from the markets for 40 cents a brace. The most successful bird hunters in this section are Lou Bogart, George Styles and Joe Degraff, each having been out several times last week and bagged a fine lot of game.

**NEW JERSEY.**—Kinsey's Ashley House, Barnegat Inlet, *Nov. 18.*—Brant for past two days have made their appearance in large numbers. Geese also. O. Parker and yours truly bagged twenty-one ducks, three geese and six brant yesterday. B.

**MARYLAND.**—Elkton, *Nov. 17.*—A quail, with a snow-white head, was shot by Mr. Wm. A. Wright, of this place, on Saturday last.

**PENNSYLVANIA.**—Greentile, *Nov. 12.*—Two parties of sportsmen have gone off on hunting expeditions; one for deer shooting in Michigan, the other to McKean County, this State. M. H. B.

**Hanover, York Co., Nov. 16.**—Game, such as pheasants, partridges and rabbits, is very scarce in this section. The deep snow and extreme cold weather last winter caused most of the birds to perish. Along South Mountain, about twenty-two miles northwest from here, deer, wild turkey, pheasants and partridges are said to be abundant. Charles Bange, Lawson Emmert and Edward Thomas, three young men of this place, recently returned from a day's hunt in that locality, having shot fifty-three partridges.

**VIRGINIA.**—New Store, Buckingham Co.—A correspondent of the *Richmond Whig* says: "The hunting law has had the good effect of making every kind of game very plentiful. On election day two deer were killed in the neighborhood by parties before coming to the polls. Something like a dozen have been killed around here this fall, and any number of turkeys are being killed daily. Squirrels and partridges are very abundant."

**Winchester.**—A bald eagle was recently killed near Winchester. It measured seven feet and eight inches from tip to tip. Game of all descriptions is abundant, including wild turkeys and pheasants.

**Deer in Rockingham.**—Our old friend, John Harman, residing near Ottobine, Rockingham County, Old Virginia, has been deer hunting within the last two weeks near Sugar Grove, Pendleton County, New Virginia, where he did some remarkable shooting. He was out on the 25th of October, when the dogs started three deer, two does and a fawn, and Mr. Harman, with a double-barrelled shot-gun, brought down all three at two shots, desperately wounding the fawn and killing a doe at one shot, and then turning the other barrel upon the other doe with fatal effect. The next day Mr. Harman had the good fortune to bring down a fine buck. The deer were in first-rate condition, and furnished Mr. Harman and family with venison for some days. There were six hunters in the party, and the result of the expedition was nine deer, our crack shot from Ottobine killing four out of the nine. This is the first instance in which we have known a hunter to kill two deer at one shot. Mr. Harman informs us that the woods are full of game of all kinds, the squirrels moving in large bodies, as if migrating to new quarters. *Rockingham Register.*

**WESTERN VIRGINIA.**—Charleston, *Nov.*—Quail were never more plentiful. The season warm, being quite dry, the young birds were not destroyed by the summer freshets. Woodcock are scarce, and as for snipe we have no "fall" flight, which I look upon as rather strange, as they are quite numerous in the spring. Pheasants are abundant. Rail are almost unknown in this section of the country, but as long as there is plenty of quail we do not object to the scarcity of other birds. J. H. M.

**NORTH CAROLINA.**—Currituck, *Nov. 14.*—Ducks are plentiful, but the weather is too warm yet to keep them. It looks, however, as if there would be a good season. C. V. S.

**ARKANSAS.**—Fort Smith.—A pelican was recently killed here which measured eight feet from tip to tip of the wings.

**INDIANA.**—Brazil, *Nov. 13.*—Quails plenty, and weather fine for shooting. Bags ranging from twenty to fifty birds a day are not uncommon. There is a scarcity of good dogs here, and I think sales of good setters or pointers could be made in this vicinity. J. J. S.

**Indianapolis, Nov. 12.**—Bears, deer and turkeys abundant in the Arkansas battues across the river. J. F.

**OREGON.**—Eugene, *Nov. 7.*—Geese and duck shooting prime on the prairies. Bags from two to twenty-three geese daily. Remington breech-loaders much in use, and justly, for they throw B shot clear through ten-pound "honkers." Mallards very fat, and shot within a mile of town. J. S.

**CALIFORNIA.**—Pine Gulch, Bolinas, Marin Co., *Nov. 7.*—I read in other Eastern journals of would-be sportsmen shooting coots on the Sound. Bah! they should be here. Our mallards, teal, sprig, etc., cover our bay, making grand sport by boat, or along shore with a good dog. Then, too, to squat on a dyke of the reclaimed marsh after sunset and drop the birds as they approach for a taste of fresher water. Practice at "Conlin's," and some experience before the butts at Creedmoor with a military Remington, sends a sure bullet now from a Henry repeater at a bounding buck occasionally, for the red-woods on the ridge shelter plenty of such game by day, and our dogs jump them in the chapparral of the gulches in early morning. My memoranda of "spoils"—hunter's spoils I mean—show nearly a second hundred of quail, too, though I shoot only for our table. But, pardon me, I am getting on the wrong target. I only write in the hope that the enclosed article may be of some service to you, and thereby enable me to make some return for the pleasure I enjoy in reading my always welcome *FOREST AND STREAM*. W. H. S.

**Los Angeles, Nov. 6.**—Quail shooting here this season fully up to the average in the valley. Parties shooting for the San Francisco market report fair profits. It is stated, I think with truth, that in some cases in ranges most affected by the last season's drought, the quail failed to pair off, and maintaining their old organizations as beives, reared no broods. However, if this be true in isolated cases, it has not affected the shooting on the Santa, San Gabriel and San Fernando, nor in the foothills on that side of the Coast Range.

Jack snipe, wild duck, gray and white geese put in an appearance with last week's rain, and the shooting at La Cienega, Ballona, Alamitos, Las Bolsas and Laguna del Negro is good; market well supplied, except with snipe.

But few bear have been killed in the county this fall, although in the neighborhood of Elizabeth Lake, grizzlies have killed an unusually large number of cattle. Venison, deer and antelope reasonably abundant, but not of extra good quality. In parts of this county deer are unusually poor in flesh. In the San Antonio Mountains the acorn mast is unusually good, and deer are in good order, but not accessible for market. Gray squirrel abundant in the foothills, as are also wild pigeon. A few plover are reported on the plains, but none have yet been seen by the writer. They are usually most numerous after the December rains.

—The Tule Shooting Club of San Francisco takes things in the easiest way. Might we say, *u-tule dulci*? They have a floating ark, fitted up with kitchen, dining-room, sitting-room, library, billiard saloon, ladies' rooms, etc., etc., and most everything save an elevator. Thus do the bardy sportsmen of the Pacific State navigate the stormy waters of the San Joaquin and Sacramento.

**SHOT DISPLAY.**—Messrs. Tatham & Brothers, whose shot advertisement may always be found in our columns, have sent us a very handsomely framed sample of their manufacture. One could hardly imagine how black shot and bird shot could be arranged so artistically. On a back of light polished wood, in a picture frame, are enclosed in small circular cases every variety of small projectile, from OO buck shot to No. 12 shot ending with the small dust shot, used by ornithologists. The products manufactured by Messrs. Tatham & Brothers have been known for many years to the sportsmen of the United States. Roundness, solidity, smooth polish must give to shot accurate and uniform flight, range and penetration. It is interesting to know that from FF, of which 24 go to the ounce, of Messrs. Tatham & Brothers' extra fine dust, there are 84,021 pellets to the ounce. At the Centennial, with the award received by Messrs. Tatham & Brothers for their patent finish drop and buck shot, was added in the Judge's report these words: "Exact uniformity of size, truly spherical form, high degree of finish, and general excellence."

**KEEP A RECORD OF YOUR GAME.**—Our old friend Mr. J. H. Mann, of Syracuse, has always been in the habit of noting the game he kills, and the weights. This record was commenced in 1854. Since that time many large woodcock have been shown him, but none that weighed as high as ten and three-sixteenths ounces until a gentleman from Bridgeport lately brought one in of this size.

**FOR PREVENTING RUST—HOW TO LOAD A GUN ACCORDING TO SHOT.**—A Brooklyn correspondent writes us: "Are you aware that Vaseline (or petroleum jelly) is a very good lubricating material for shot guns and rifles? It never gets rancid, and prevents the oxidation of steel and iron. Has been used by myself for some time, almost since its introduction into the market, and find that it keeps the barrels of my rifles and guns bright and free from rust. Have also used it as a lubricator on the outside of the barrels during the time I was bay shooting, and found it to prevent the rusting so prevalent upon the salt water."

In one of the previous numbers of *FOREST AND STREAM* I noticed an answer to a correspondent who asked, "How shall I load my 12 bore?" in which you decided that No. 8 and No. 4 shot require the same amount of powder. My experience tells me that with my 10-bore 9½-pound Greener I must use 4 drs. C. and H. No. 5 to 1½ oz. No. 8 shot; 3½ drs. C. and H. No. 5 to 1½ oz. No. 4, and 3½ drs. of the same powder to No. 2 shot. The larger the shot the less amount of powder required to obtain a good penetration and pattern. Using 4 drs. of powder to No. 2 shot, for instance, would scatter the shot too much, although my gun is choked. The above is the result of a trial at paper targets, with shells carefully loaded.

[Thanks to our correspondent. We shall always be glad to receive results of similar experiments made by our friends.—Ed.]

**WHO MADE THE FIRST CHOKE-BORE?**—A Boston correspondent says:

I was somewhat surprised at your answer to the question proposed by C. E. D. in paper of Nov. 1. A choke-boring gun is no new idea. I have a gun now in my possession, choke-bored by the veteran gunsmith, Nathaniel Whitmore (now carrying on business with his son at Mansfield, Mass.), twenty-five years ago; I can show dozens of them thus bored twenty or more years since. I consider Mr. Whitmore the pioneer in this mode of boring guns, and his many friends think he can bore equal, if not superior, to any other man living. J. W. H. W.

[This choke-bore invention, and who made the first choke-bore, we fancy, after a while, will be found out to be contemporaneous with Tubal Cain.—Ed.]

**QUITE CONVENIENT.**—We take the following from the *Rocky Mountain Husbandman*, published in Diamond City, M. T.:

A couple of antelope appeared upon Diamond Bar, about 300 yards distant, yesterday morning, causing a few minutes excitement among our sportsmen and giving an opportunity for display of marksmanship. G. A. Hampton brought down one from the stoop of the *Husbandman* office. Frolicking nimbly upon the grassy hillside, the fleet-footed gazelle leaped high in the air at the crack of his rifle and tumbled down the forty feet embankment. M. V. B. Green laid down his stick and rule and dropped the other in its tracks the first shot, as it was maneuvering to learn the whereabouts of its mate. He says it is the "fattest take" he has had for some time. Not over a journal is published in a land where such choice game can be hunted from the office door.

[There are not many newspaper offices so conveniently situated. Perhaps the landlord of the *Husbandman's* office received a big rent on account of its being a central locality and in the midst of game. We might wait all day on the back stoop of the *FOREST AND STREAM* AND *ROD AND GUN* office and not get such a chance. Next time, however, that antelopes come promiscuously around our sanctum we shall be quite satisfied with a single antelope.]

—In *Land and Water* the information is given that if a little oil be poured on shot their delivery will be much closer. This we have tried ourselves, and know to be effective. We remember on one occasion having seen a wildcat, and a good big one, killed by a load of shot at a fair distance. We do not remember the size of the shot, but are pretty sure the shot were not large. The way it was done was that the trapper (for an old hunter he was) ran to a wagon, took from the hub of a wheel about as much thick grease as he could put on his thumb nail, and dropped it on top of the shot before driving in the wad. On examining the cat, the charge seemed to have balled, and might have been covered almost with a silver dollar. This is a hint worth knowing.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INDOCTRINATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company.

-AT-

No. 111 (old No. 103) FULTON STREET, NEW YORK.  
[POST OFFICE BOX 2882.]

TERMS, FOUR DOLLARS A YEAR, STRICTLY IN ADVANCE.

Twenty-five per cent. off for Clubs of Three or more.

## Advertising Rates.

Inside pages, nonpareil type, 25 cents per line; outside page, 40 cents. Special rates for three, six and twelve months. Notices in editorial columns, 50 cents per line.

Advertisements should be sent in by Saturday of each week, if possible.

All transient advertisements must be accompanied with the money or they will not be inserted.

No advertisement or business notice of an immoral character will be received on any terms.

\* Any publisher inserting our prospectus as above one time, with brief editorial notice calling attention thereto, and sending marked copy to us, will receive the FOREST AND STREAM for one year.

NEW YORK, THURSDAY, NOVEMBER 22, 1877.

## To Correspondents.

All communications whatever, intended for publication, must be accompanied with real name of the writer as a guaranty of good faith, and be addressed to the FOREST AND STREAM PUBLISHING COMPANY. Names will not be published if objection be made. No anonymous contributions will be regarded.

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions.

Nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for dereliction of the mail service if money remitted to us is lost. No person whatever is authorized to collect money for us unless he can show authentic credentials from one of the undersigned. We have no Philadelphia agent.

Trade supplied by American News Company.

Western Manager.

**A HOME FOR FRIENDLESS GIRLS.**—A benevolent institution on the corner of Seventh avenue and Thirteenth street, is doing a quiet but noble work by gathering in young and friendless girls, and providing them with shelter and protection till they can be returned to their friends, or placed in permanent homes in Christian families in the country. About two hundred are thus yearly provided for, and many touching scenes are witnessed as these wanderers find themselves once more housed and protected. Mary —, an interesting child of eight years, whose mother was buried from a tenement house, and she, left in the streets, wandered for weeks about the city, nobody believing her story, and she not knowing where to get help. She was one day taken from a door-step, where she sat crying, and brought to the house. "Never," says the Matron, "did I see a child weep harder than she did when told that she might stay." This is but one instance among many that might be mentioned. The institution lives by voluntary contributions, and as winter is approaching it needs help. Any one wishing to give to this worthy object can send directly to the Home, 41 Seventh avenue, or to Mrs. Rev. Dr. Hallock, 133 West Thirteenth street. A Fair held at the Home, commenced Wednesday, November 21, and continues through the week.

**PHILADELPHIA GRAND NATIONAL DOG SHOW**—Co-operation of the PENNSYLVANIA KENNEL CLUB.—We are glad to announce that Dr. Twaddell is actively interested in the dog show to be held at Philadelphia, and we are in receipt of the following communication from the Pennsylvania State Kennel Club, which gives its warm approval of the exhibition. This action of the Pennsylvania Kennel Club sets then at rest certain carpings in regard to the character of the Philadelphia Show:

"The Pennsylvania State Kennel Club, in order to dispel any erroneous impression that the bench show for dogs, to be held at Philadelphia from the 26th to the 30th of November, is merely a local exhibition, do hereby announce that they will be associated with the gentlemen whose names have already been published as patrons, and under whose united patronage the exhibition is to be given.

JOHN C. JOHNSON, President.

WM. R. KNIGHT, Sec. pro tem."

## OUR QUESTIONS AND ANSWERS.

WE wish to put a flea in the ear of our correspondents respecting this department of our paper.

It is more than a pleasure to answer the numerous questions put to us—it is a duty. We are only too glad to act as Cædipus for the world at large, in fact, to become a kind of Providence for those "who want to know, you know." Of course, we lay no claim to infallibility, and should the Sphinx occasionally get the better of us, it is certainly from no carelessness on our part; for no questions are ever put to us that we do not strive our very best to answer. Either, then, the FOREST AND STREAM AND ROD AND GUN must be very popular, or the belief in our ability to solve all kinds of intricate problems is well nigh universal. Each mail brings to us an avalanche of queries. "Bring us this day our daily questions," we usually say with becoming cheerfulness.

Puzzled! Of course we are sometimes. It would take a very gifted human being—a Solomon, in fact, with a cosmical brain—not to be puzzled over the questions. Would the reader like to have an example of how an answer has to be chased up? Suppose we follow the story attached to a certain paste-board box. It came from beyond the Rocky Mountains. All that box held was a wing, a claw and the head of some bird. Not being a Coues, of course it was not to be spotted as to species at a single look. Down came from the shelves our entire ornithological library. The books are hunted through. We find many birds looking something like the specimen, but not exactly. We cannot give a satisfactory reply. We send out the box and its contents to a noted naturalist who lives six miles from the office. That wise man returns the box and bird remains with two brief, dispiriting words, "Don't know."

We worry and fret over that bird all day. We are perpetually conscious of the question, because the bird fragments are no longer pleasant to the smell. But the FOREST AND STREAM office is the headquarters for the naturalists. There just happens to come a distinguished Smithsonian professor. Before he has hardly a chance to greet us, that box is shoved at him. The professor looks at the specimen critically for half a minute, then says, "Why—yes—it is so and so. Don't you see the whole trouble is that the bird—a rather rare one—has got on his winter plumage?" We smile wisely, but note the answer down just as quick as we can for fear it may escape us. Now when the answer about this bird is printed, the space it will occupy may not be over two lines, yet it has been a source of anxiety for forty-eight hours. The casual reader who glances over "Answers to Correspondents," can have no possible conception of the trouble those answers have caused. Sometimes we telegraph to long distances at our own expense, and this costs considerable money as well as time. We thus purposely enter into some of these details in order to explain how in these two or three columns the work is done, and wish to state that these replies are often due to the united labors of some twenty people. In fact, to keep up this page in a consistent way, as much time, money, talent and thought is necessary as would be required to produce a whole paper. Specialists can readily reply to certain questions, though in the many curious queries put to us in regard to guns and ammunition, and all that relates to fire-arms, we frequently have to call in the assistance of the leading experts of the country.

Nothing gives more anxiety and care to us than the replies concerning the innumerable dog maladies. At times it seems to us that an epidemic must be raging through the land. No end of thought and prudence must be used in diagnosing a canine case from a letter. We frequently receive as many as six closely written pages in regard to the condition of an animal, every word of which has to be closely studied. Occasionally we almost fancy that an admirer of the paper had at his leisure been storing away a whole series of questions, and suddenly made up his mind to send his entire harvest to our mill to be ground, for in one and the same batch, lumped as it were, is tumbled out before us the most heterogeneous mass of things. In one letter we have solved knotty points about dogs, guns, canoes, pneumatics, billiards, prices of real estate, the best place to send a boy to school, the price of coffee, cooking terrapins, an explanation of the moons of Mars, and some other minor matters.

Sometimes, we regret to say, very silly questions are asked of us. Things of this character try a man's patience, even if he be an editor. Changing but very slightly the article in question, we give pretty nearly a copy of a series of queries:

"1. I think a portable gridiron for camping out would be a good thing. don't you?—a gridiron which could be hinged and a party could carry in their vest pocket. 2. If invented, could I get it patented? 3. Would you look over the patents and see if any one has ever thought of such a thing? 4. What would it cost to have it patented? 5. Ain't patent lawyers mostly frauds? 6. If I did get up such a gridiron who would make them in quantity in your city? 7. Do you think I could interest the market? 8. Could it be introduced into the army? 9. Would it not replace a frying pan? 10. Would you have the slats of the gridiron to run across or slantwise? 11. Perhaps a frying pan with a changeable bottom to turn into a gridiron would be what was wanted? 12. How would it do for you to offer my gridiron as a premium to your new subscribers? 13. If I advertise with you will you take it out in gridirons? Please answer by return mail." [Not a postage stamp enclosed.]

Occasionally there comes to us a series of questions on dog breaking, which embrace the whole method. Simple questions of this kind we cheerfully answer, but when an encyclopedia is wanted we must refer those of inquiring minds to the

books specially printed for these purposes. Our life would be too short did we endeavor to reply to such.

In glancing over the files of our paper it is wonderful to think of the mass of valuable information we have imparted. How many nice questions in fish culture, in natural history have been determined! When we consider the amount of labor expended over these particular columns we forget all about the toil, remembering how in our humble way we have been enabled "to throw light into dark places."

**OUR AWARD AT THE CENTENNIAL.**—We have to acknowledge, from the Director-General of the Centennial Exhibition a diploma and medal, awarded to us for a "Collective Exhibit of Fishing and Hunting Implements," No. 12, Group XXVIII. Though our honors have been very slow in coming, we appreciate all the same the distinction. May our successors in 1877 (for the FOREST AND STREAM AND ROD AND GUN will certainly exist in all forthcoming ages) be able to thank some future Director-General Goshorn.

**LEADING NEWSPAPERS.**—This is the name of a pamphlet published by Mr. H. P. Hubbard, the well-known advertising agent of New Haven, Conn. The title page is most happily conceived, for here are displayed the various heads of all the leading papers in the United States. In this assemblage we are pleased to notice that the FOREST AND STREAM AND ROD AND GUN occupies a conspicuous position. Increasing business has forced Mr. Hubbard to change his base, and he now occupies spacious quarters of the City Bank of New Haven. As a perfectly reliable advertising agent we take great pleasure in recommending Mr. Hubbard. Not only will advertisers be perfectly satisfied with their agent, but the newspapers will find Mr. Hubbard prompt and reliable.

**A NEW PAPER.**—The *Illustrated Dramatic and Sporting News*, published by Henry Leslie, made its appearance last week. The cut on the title page, save that the order of the characters is reversed, is precisely like that of the London *Sporting and Dramatic News*. We may suppose, then, by the preference given to this transposition of the words, that the new journal will give great attention to dramatic news and to reviews of theatrical performances. The portrait of the late Edwin Adams recalls the pleasant features of the dead tragedian, and there is an excellent picture of the funeral services of this actor in Philadelphia. As grave and gay must be united, we see an illustration of that comical play, the "Pink Dominoes." Sporting matters will find a place in the columns of the paper. In point of typography and general neatness the new aspirant for public favor is excellent.

## VACATION RAMBLES IN MICHIGAN, WISCONSIN AND MINNESOTA.—No. 6.

BY THE EDITOR.

NOVEMBER 21, 1877.

MY FRIENDS: In fine weather prepare for foul. Overcoats, blankets and waterproofs should invariably form a part of a sportsman's summer outfit for the higher latitudes. One can never tell what a day may bring forth. Tempest often follows calm, and cold succeedeth sunshine and warmth without phenomenal warnings intelligible to ordinary observers. Without requisite wraps the voyager is certain to feel a sense of helplessness or dependence and a constant apprehension of trouble to come, which a person who has judiciously provided himself therewith never need entertain. I always mean to travel with a complement of things necessary, from rubber boots to mackintosh and sou'-wester. I am particular in giving this delicate hint, because I find that even experienced people are prone to pin their trust upon the roseate appearances of mid-summer atmospheres, which occasionally prove as deceitful as the smile of a coquette.

The sea was boisterous on the August day when I left Petoskey on my trip to Charlevoix, sixteen miles down the coast, and the distressed little steamer, Van Raalte, rolled and thumped at the end of her pier, and strained at her hawsers like a young Samson in irons. The big waves thrashed her seaward side, and the spray beat over her deck. Nevertheless, Capt. Dodge hung on bravely to his wheel, and never once heeded the threats of the sheet-iron Indian on top of the funnel behind, who menaced him with uplifted tomahawk. Such empty demonstrations could never make the captain dodge or swerve from duty. At the end of the three hours' run, most of the passengers were convinced of the importance of immediate railway connection with Charlevoix. When the town hove in sight, an unbroken line of surf churned the shore as far as the eye could see. A beetling sand cliff confronted the incoming vessel, and apparently shut out all chance of refuge; but as she neared its "swilled and confounded base," the land gradually opened and disclosed a deep and ample passage that led into a land-locked harbor, whose serenely even watery storms can scarcely disturb. Tall three-masted schooners, tug-boats and yachts, lay quietly at anchor, or moored alongside the bold shore, while the storm lashed itself into a futile rage outside. This snug harbor is really a small lake, called Round Lake, whose outlet is the channel by which we enter. From Round Lake there is a similar channel into Pine Lake, an interior body of water sixteen miles long, with two arms or divisions, each about nine miles in length. It is most navigated by large vessels in quest of bark and cord-wood, and offers pleasure to yachtsmen that few lakes afford. Its scenery is charming. Its shores are enclosed

adjoining wooded hills, interspersed with cottages and  
is, and there are ruffed grouse and deer in the woods and  
bass and muscalunge in the waters.

At Crook, one mile from Charlevoix, and Deer, Boyne and  
the Jordan are near the head of the lake, are fine trout streams,  
giving a few grayling. At the mouth of both the Boyne  
the Jordan are comfortable inns, with boats to let for fish-  
sailing and shooting parties. Charlevoix itself occupies  
a romantic situation, as our description shows. A por-  
tion of the town, including the hotel, covers the crown of the  
whole possibly the greater area is laid out on a natural  
site that extends from the little lake to the great outer  
arms of Lake Michigan. The business part extends in a  
canyon along the side of Round Lake, and is reached by  
a wharfage across the outlet. Cooper's Hotel, called the  
"Main City House," is comfortable, but there is a grand  
hotel for a stock company to build a first-class house  
on the crest of the cliff, from which the view is sweeping and  
diversified. From Charlevoix a little steam yacht  
goes twice a day to the mouth of the Jordan, at the head of  
the lake, and it is a novel sight to many visitors to see her  
under way, loaded with excursionists and towing a dozen  
boats and boats astern, en route for the approved fishing  
spots. A lively little craft is the "Jennie Sutton," doing  
ten and twelve miles an hour without much ado, or waste  
steam.

Brother Turner had brought with him from Grand Rapids,  
rail and steamer, his Bond (iron-sectional) boat, which he  
has improved by the construction of a transverse section,  
so used as a "well," that it was completely adapted to the  
requirements of the angler. This section was bored with  
its beneath the water line, so that the fish in it could be  
at any given time; and while it lengthened the boat  
sixteen inches, it did not materially change her lines.  
I tested the Bond boat pretty thoroughly for several years,  
am convinced that it is better adapted for rough work in  
broken and brush-choked water of forest streams than any  
craft—simply because it is of iron, and because it is  
so conveniently portable by dividing it into sections. Mr.  
Turner's fish-well also makes a capital and secure locker for  
seafood articles while the boat is being transhipped from  
port to port by land.

The upper portions of the Boyne and Jordan rivers, and  
most of all the Michigan forest streams, are filled with  
logs and crossed by fallen trees, which make successful nav-  
igation a problem, to be solved only by tact and much prac-  
tice. In angling, the streams are invariably fished from boats,  
the banks are a tangle, and passage through the woods to  
the almost impracticable; it is possible to wade, but by  
means comfortable to do so. Streams are always fished  
from, for reasons that will become obvious enough when the  
fisher reaches the ground. With a man competent to handle  
a boat this method of fishing is greatly to be preferred. It  
is made even luxurious. One can scarcely conceive of  
a more favorable stream than the Jordan for this kind of work.  
In the first two miles after entering its mouth, the channel  
is through a rush and grass meadow, and the current is  
comparatively sluggish. As the ridge or height of land is ap-  
proached, it becomes very rapid and much broken. For ten  
miles it is simply wide for good fly-casting, and sufficiently  
void of overhanging and protruding branches and brush. Its  
depths are four feet deep, clear as crystal, ice-cold and so de-  
licious that one is inclined to drink immoderately. I think  
an old toper might learn to prefer it to beer after he be-  
comes accustomed to it. By making headquarters at Web-  
ster's, a neat log-house about five miles from its mouth, one  
can fish the upper and lower waters to the best advantage.  
Angling can be more delightful than a week's sojourn at this  
place clearing in the woods, a half mile back from the river.  
On the rustic bridge that crosses the stream just at this  
point, the path winds up a moderate hill through a hardwood  
forest, in which large sugar maples are frequent, and  
the visitor no sooner emerges and catches a glimpse of the pre-  
sences than he feels that neatness, comfort and good cheer  
well within. The surmise is speedily strengthened by abun-  
dant testimony. The clearing contains but a few acres, and  
the adjacent woods harbor numerous deer and bears. Some-  
times the latter are obtrusive. One dark night at ten o'clock  
I heard the bawling of a calf which had been tied near the  
edge of the clearing where the well-worn path leads up from  
the river. The appeal roused the inmates of the house, who  
went to the rescue with bull's-eye lantern, ax and gun.  
The calf was found unharmed, and apparently grateful. This  
fact was repeated and nothing more; but the retreat of the  
delicious bear from his vicinity had been apparently as sum-  
mary as Napoleon's from Moscow. Not a grease-spot remain-  
ed to indicate where trouble had been so near Bruin. His es-  
cape was fortunate—for him. More serious ails have often  
been drawn from the wood, and harder to bear.

In new countries like this earthworms have scarcely had  
time to acclimatize or domiciliate. The angler, therefore,  
must not depend on "worms" for bait. Neither is it practica-  
ble for him to pursue the festive grasshopper with bated  
breath. These insects do not forage much in these parts—at  
least, they have not for ages. Nevertheless, the woods fur-  
nish abundant materials for lures, and the sportsman need  
only take his gun and knock over a chance rabbit, squirrel,  
or pigeon to obtain all that he de-  
sires. In utilizing baits of meat, much ingenuity is required.  
I have no doubt that the marvelous success of my com-  
panion, A. B. Turner, was as much due to his contrivances  
and preparation as it was to his skillful manipulation

thereof in presenting them to the fish. Diplomacy depends  
largely upon address, and Mr. Turner was plenipotentiary in  
all respects. Hamilton Fish himself never did better at the  
court of St. James, though it is not easy to measure the  
talents of the two gentlemen by the same scale. "I've re-  
ceived from Isak Walton and the chosen disciples the most  
approved instructions for dressing baits, but I am free to say  
that I have watched my comrade with an interest that could  
be born only of new developments. One day I had fished the  
lower stream with flies and taken eighteen fair trout, but  
none large. I was satisfied with the result until I saw A. B.'s  
returns. The well in his boat was alive with trout! I think  
he had some eighty in all. I marveled and congratulated,  
and appreciated the graceful consideration which prompted  
him to account for the difference in our catches by explaining  
that fly-fishing in August is not fly-fishing in June. If trout  
are not rising for their food, trailing artificial flies upon the  
surface are not the tactics to employ. If they stick to the  
bottom we must send our lures to the bottom for them. The  
two methods of fishing are as different as can well be imagined.  
However, I prefer the long-range practice to manoeuvres at  
close quarters, though I have none the less respect for such  
admirable tacticians as brother Turner.

One day when returning from a visit up stream where I had  
indifferent success with all manner of baits, artificial and nat-  
ural, I unexpectedly overhauled him and his boatman at a  
bend of the river, and caught him in the act of pitching his  
hook under a tangle of roots. His bait looked as big as a bob,  
and it went down with a plump into the water that showed  
his line to be heavily shot. He had scarcely six feet of  
line out, and he handled his rod as a fencing-master does his  
foil. First he swayed it gently to the right, then he moved it  
to the left a little; then he raised the tip a trifle; and finally,  
giving a smart twitch, he lifted out a one-pound trout, and  
tossed it dexterously into the open "well" in his boat. A  
splash and commotion followed which showed that his box  
was well filled. In a twinkling his hook was in again at the  
same spot, and he pulled out another big trout. Seven more  
followed! By the way, did you ever try to pitch trout at a  
mark? To become expert requires considerable practice. If  
you are proficient at quoits, or have learned in the rudimentary  
school where pennies are used, you may succeed in tossing  
fish into your basket and not miss once. But not otherwise,  
at first. When Brother Turner had emptied his trout platter,  
I drew my boat along side of his and was instructed in the art  
of baiting a hook. Cutting the pectoral fin from a trout of  
medium size, he tied it on the shank of his hook in such a way  
that it looked much like an artificial fly with wings outspread.  
Next he cut a considerable lump of red squirrel meat, and  
thrust the point of the hook into it until no part was exposed  
and tied it on. When completed the contrivance made a very  
respectable sort of a bug. It certainly looked tempting, and  
was well calculated to impose upon the credulity of a trout.  
He said they would take this when all other lures failed.  
Presently we dropped down stream a little, and in a twinkling  
he took another big fish. He seemed to capture them without  
much persuasion. I confessed my surprise at his success,  
which seemed to rest on the following points: First, the  
quality and make-up of the bait, which he would spend many  
minutes in preparing; second, shooting the line heavily, so  
that it would sink quickly and not be drawn by the current  
away from the place which he wished to fish; third, getting  
as nearly over the spot as possible and keeping so quiet as not  
to alarm the fish; fourth, manipulating the bait so as to at-  
tract attention, and striking so as to hook the fish when he  
bites; fifth, manipulating so as not to entangle the line in the  
roots before or after the fish is on the hook. Beyond these  
there seems to be a quickness of sight in detecting chance  
movements of the fish in the water, as well as an intuitive per-  
ception of the precise spots where they lie. Evidently most  
anglers fail of success because they first let the current carry  
the bait astray, and afterward alarm the fish by their move-  
ments in endeavoring to place the bait right. In a well stocked  
stream like the Jordan, where probably 30,000 fish were taken  
the past season, every suitable place is more likely than not to  
hold an occupant; and if the angler does not secure him, it is  
because he has alarmed him by the awkwardness of his move-  
ments, or else has not put the bait where the fish can see it.

I cannot see how the natural resources of a river like the  
Jordan can compensate for so great and constant a drain upon  
them as has been made within the past four years. If the  
stream shall remain prolific for some time to come, unless it  
be artificially stocked, it will be only because the choked con-  
dition of the upper waters by logs and rubbish affords a sure  
protection against persistent and improvident fishing.

Some few years ago grayling were very abundant in the  
Jordan, and several dozen was a fair day's catch; now they  
are seldom seen. The first one I had upon my hook afforded  
a new sensation indeed. His moods and motions were so ca-  
pricious and so different from those of other game fish I had  
handled that I awaited each new development with the inter-  
est of one who watches for the denouement of a drama, or the  
anxiety of a physician who studies the diagnosis of a disease.  
To me it was the reading of a page in the romance of the New  
World, which I had long desired to open. What Back and  
Mackenzie had studied in the Arctic circle; what more recent  
ichthyologists had supposed existed only in tradition; what  
to Parker and Fitzhugh afterward became a discovery, was  
presented to me at last as a living reality. All the glories of  
dark and brilliant coloring which had made *thymallus signifer*  
famous among the game fish of Europe was now reproduced  
and intensified here in his western kinsman, *thymallus tri-*

color, the beautiful creature which struggled at the end of my  
line with many a leap and erratic plunge. I took my first  
grayling by no accident. I had laid my plans methodically  
for his capture. When I ascended the Jordan my boatman  
pointed out to me deep holes scooped out in the sand in mid  
stream where these fish are wont to lie, and after long and  
patient examination of many such basins, I saw at last my  
specimen lying motionless, head up stream, glistening like a  
sunbeam on the sand. I could have taken him there and  
then with worms, the boatman said, but after a brief contem-  
plation of the pretty object, I pushed on further, feeling as-  
sured that he would rise to my fly upon return. One other  
fish I saw still further up the stream, and him I marked also.  
Finally, when I was fully prepared with the finest tackle my  
kit afforded, and had bent upon my leader the black and yel-  
low fly which I had been told was killing, I drifted cautiously  
down toward the pool, sitting in the bow, and the boatman  
holding steadily with his setting pole at the stern. With the  
longest and most delicate cast I could conveniently command,  
I crossed the surface of the silent water once, twice and  
thrice, and at the third cast raised him. He shot from the  
bottom like a silver shaft, fastening firmly on the hook, and  
then dove with a vim that bent my rod into a graceful curve.  
Then, quick as a flash, the instant he felt himself checked, he  
leaped clear of the surface, his splendid dorsal stiff with nerve  
and radiant with many hues that seemed reflected in the  
drops that quivered from it. Down he went again, taking  
line as he ran; then up and out into the air once more,  
a foot above the surface of the water, and back to his  
element with an activity that no trout ever showed,  
and startling for its display and continuation. I had  
him in hand for several minutes, but landed him as soon as  
possible for fear of losing him. The instant I placed him in  
the well he became quiet, and scarcely betrayed a sign of fear.  
My second fish I hooked as surely, and the like manoeuvres  
followed, but I was in no haste to land him. I deliberately  
studied his play, and carefully noted every movement. At last  
he was placed beside his comrade in the well, and a beautiful  
pair they appeared, with their mild, gentle eyes and trans-  
lucent dorsals, no longer rigid, but waving gracefully over  
their backs, half erect, like plumes upon a bonnet. Sunlight  
falling upon their brilliant and matchless colors lighted them  
up with a glow which the dolphin might have envied. It  
seemed to be a sin to rob the river of this remnant of its fairy  
denizens. I believe that few remain in the stream. Yet there  
are other rivers where they abound, and abundance makes the  
choicest objects seem common. So, other anglers will take  
them by the hundred, as I have seen them taken, until at last  
the streams will all be depleted and the bereft places will  
know them no more. I agree with Fitzhugh, Norris, Milner  
and Mather, that the play of the grayling is incomparable  
with that of any other fish of its weight and inches.

To recount our many experiences of a pleasant week upon  
the Jordan would fill a lengthy chapter. The fabric I weave  
from the memory thereof I would fain unravel, like Penelope,  
that I might weave it over again, so few are the delightful  
episodes of this present life; but Ulysses must return from his  
wanderings to his vulgar mutton, and so I stop the loom here-  
with. There are deer tracks along the shores of the grassy  
islands in the upper stream which I would like to trace to  
favorite haunts on the hardwood ridge. I could write of the  
coveys of grouse we flushed in the thickets; of the bass and  
pike we caught in Pine Lake; of the jolly trips we made on  
the "Jennie Sutton," and of our cruises in open boat along  
shore. Perhaps a repetition of our enjoyment is in store for  
a future vacation. *Quien sabe?* If not for us we hope it re-  
mains for many of our readers. For the present we bid adieu  
to the sparkling waters of the Jordan, the comfortable home  
at Mrs. Webster's, and taking a hasty pull down stream, join  
the steamer in waiting to take our boat in tow, and return to  
Charlevoix, where we shall again board the Van Raalte, and  
pursue our journey to Torch Lake and its adjacent waters.

HALLOCK.

## GAME PROTECTION.

ABOUT FYKE NETS ON THE JERSEY COAST.—The follow-  
ing correspondence will doubtless be interesting to those  
who are desirous of shaping legislative action toward prevent-  
ing the wasteful destruction of fish on our coasts:

NEW YORK, Oct. 28, 1877.

MR. K. W. KINZEE, Ashley House, Barnegat Inlet, New Jersey:

Dear Sir—Your name has been frequently mentioned this last sum-  
mer in FOREST AND STREAM, and more particularly in a recent number  
of that journal, in connection with a determination to put a stop to net-  
fishing in Barnegat Bay. I have been requested to communicate with you  
on behalf of the Excelsior Fishing Club, located at Huguenot, Staten  
Island, upon the subject, it being believed that those interested in the  
protection of game sea fish for sporting purposes should act intelligently,  
and, so far as may be necessary, in unison, in order that angling with  
rod and reel shall remain a practical and successful sport.

Early last spring fykes, large and small, and pounds running a half  
mile from land, were set with two and one-half inch meshes, all along  
the Staten Island shores of Haritan Bay, including Prince's Bay, and we  
were informed that many of them were owned by New Jersey ush-  
ermen, who had been driven from that State by hostile legislation. Weak-  
fish were captured by these nets long before they would take the hook.  
The fishing season began with us this year about the middle of August,  
when the undersigned, among others, took several large fish in shore  
with a rod, two or three of which contained the roe. So that it would  
seem that weakfish run up in our waters as they grow warm, for the  
purpose of spawning, and that until the spawning season is over they  
will not bite at a hook.

The damage, therefore, which is done by these nets to the fish pro-  
duct cannot be estimated; and when in addition it is remembered that  
of the eggs deposited but a comparatively small number are hatched,  
and that of those hatched many are destroyed by their natural enemies,

it can easily be seen that all these destroying agencies combined will soon depopulate the waters. Should net-fishing be abolished? If it cannot be abolished how should it be restricted? It is for the purpose of obtaining suggestions and advice as to the best mode of obtaining relief in this respect, and to have the benefit of your "views as to the best method of preserving fishing in New York Bay and its vicinity" that I am desired to correspond with you.

With us the fishing has been each season poorer than it was the season previous, so continuing during the last four years. We would like to know what your experience has been in this regard, and, if it is similar to ours, to what you attribute it. If you can, without trouble, we would like you to inform us what the law of New Jersey is upon the subject of fishing with hook and line or with nets, and such other matters of suggestion and of fact as occur to you to mention.

We will gladly give you such information as lies in our power to give, and to extend to you our aid in the protection and fostering of the honorable and ancient pastime of angling; and we hope that out of the community of interest in which all true sportsmen are equal sharers, there will spring some plan which shall conserve the welfare of the many—the anglers, the hotel keepers, the wagon men, the tackle dealers, the railroad and steamboat people, and all connected with them directly and indirectly in their business, and protect them against the depredations of a handful of pot-hunters whose labors benefit only themselves and destroy the fishing without lessening the cost of fish to the consumer. Respectfully,  
ALBERT E. COCHRAN.

ASHLEY HOUSE, BARNEGAT INLET, Oct. 31, 1877.

ALBERT E. COCHRAN, Esq., New York City:

Dear Sir—In reply to yours of the 23rd inst., it will afford me great pleasure if any suggestions of mine will further the cause in your waters. The article referred to in yours, from the FOREST AND STREAM, under the heading of "No More Nets in Barnegat Bay," gives you an idea of what I am doing. We had a bill passed some three years ago abolishing all fykes and pounds, and (last winter) the setting of gill-nets between sunrise and sunset. The latter did not injure the interests of the gill-netters, except in the extra labor of taking up their nets in day-time, as fish will not get into, except when the water is thick; yet, it interfered with our fishing, as our channels in all directions would be filled with gill-nets. Bluefish coming in our bay from the sea, meeting nets in all directions, would back out and pass to sea again. As to the others (fykes and pounds), abolishing them drove away all of your New York pot-fishermen, and no doubt (as you justly observe), sent some of ours to your waters. Weakfish enter our bay as early as May to spawn, and can only be taken with nets; we seldom hear of one being taken with the hook. Knowing our bay to be full of them in May and June (having seen hundreds taken every spring with gill-nets), all spawning fish, and they being rarely taken with the hook until July, and more frequently in August, is conclusive evidence that they will not take the hook until they have deposited their eggs. That they enter the bays for that purpose is without doubt, and, for every fish taken by net until July, hundreds are destroyed.

Net-fishing of all description should be abolished. If you cannot go that far in your State, and wish to protect the weakfish, stop the use of gill-nets until they bite at the hook; or, better still, make it a heavy penalty to have on the person or in his possession any weakfish before July 15. Our striped bass and perch fishing has become almost extinct, owing to the fact that in winter parties at the head of our bay, in hauling seines under the ice, in catching tons of large fish, destroy wagon-loads of small fish, from two to three inches in length, which they pull out on the ice in hauling their nets, and leave them to perish. Our sheephead and bluefish have been better since the abolition of the pounds.

The "Sunrise Bill," and that prohibiting setting nets before July 1, were only passed last winter, consequently we cannot yet see the effect on weakfish.

The weakfish taken this summer ran small, and scarce at that; we attribute it to the above causes.

I find that there is nothing like putting our grievances in print. Write up on the subject; send it to the FOREST AND STREAM. Several of my articles were copied from that journal in our local papers with good effect. Give "us Jersey pirates" thunder for passing such laws and sending our pot-fishermen among you.

I fully expect our bill—abolishing all nets of any description—to pass this winter; even owners of nets in the village of Barnegat are in favor of such a bill. They own yachts, also, and in summer make large wages by taking out fishing parties.

By figures and the decrease of their business, their interest has been awakened. We expect some opposition at the head of the bay, but force enough will be sent to Trenton to carry the measure through.

You may command me at any time. That we may succeed, and New York follow suit, is the wish of  
Yours truly,  
J. W. KINSEY.

THE WATERS OF ONONDAGA COUNTY BEING ROBBERED.—The Syracuse Journal, Nov. 10, has the following:

For some time past several gentlemen of Syracuse who are true sons of Izaak Walton have been made aware through personal observations and otherwise, of the terrible slaughter of fish in the waters of Onondaga County, and more recently of the destruction of large numbers of lake trout, by means of devices which are illegal. They have also found that men making claims to respectability are engaged in the nefarious business, and that some of the game constables actually participate in the profits. It is known to a certainty that trout are being taken from Skaneateles Lake, and trout said to have been caught in Onondaga Lake are in market. They are so plentiful that the price has fallen from 25 and 30 to 12 cents a pound. It has been said that trout were being taken from Skaneateles Lake by Seth Green's men, by direction of the Fish Commissioners, for propagating purposes. This story is utterly false, as will be seen by the following letter to a gentleman of this city:

ROCHESTER, Nov. 7, 1877.

Yours received. None of my men have taken any fish from any of the inland lakes in this State, neither has any one had permission, either from myself or the Commissioners, to take them for propagating purposes. Whoever is taking them is doing so at their own risk and for their own use. The waters of the Skaneateles and Onondaga Lakes are well stocked, and if men will fish in them they should be made to suffer for it.  
Yours,  
SETH GREEN.

When the present protective laws were under consideration by the Legislature last winter, the Journal stated very distinctly that they would never accomplish the object desired in the matter of affording protection to fish, for the reason that no provision is made for the encouragement of their enforcement. The detection of fish robbers and discovery of sufficient evidence for their conviction involves the expenditure of money which the laws do not provide, and no true sportsman, or company of sportsmen, care to expend their own funds for such a purpose for the benefit of the sportsmen drones, who will neither pay nor work. It is clear that prompt and efficient action of some kind must be taken, else our waters will soon have been robbed of the last fish.

HUNTING CONTESTS.—"Side hunts," with sundry other institutions of the good old times, are fortunately less frequent than formerly. In many of the longer settled States, the promiscuous slaughter of every kind of game which forms such a prominent feature of these contests, has deservedly met with the disapprobation of more thoughtful sportsmen. Through the West and Southwest, repeated hunts of this character cause no sensible diminution of game, we may predict the time when, even there, a protesting voice will be raised against the custom. Certainly in such a State as Massachusetts, the scarcity of game of all kinds should warn clubs against indulging in such slaughter adverted to in a communication from a Boston correspondent:

BOSTON, Nov. 14, 1877.

EDITOR FOREST AND STREAM:

I inclose an item clipped from to-day's Boston Herald, to wit:

Worcester, Mass., Nov. 13.—The members of the Worcester Sportsmen's Club had a hunting contest to-day. Sides were chosen, captained by E. S. Knowles and W. S. Perry. The game shot was principally partridge, quail, woodcock and rabbits. The count for Knowles' side was 1,145 to 270 for Perry's party. The victors will have a game supper at the Bay State House to-morrow evening, the losing side footing the bill.

Can we wonder at the small bags of the true sportsman when an organized battue is of a common occurrence, and everything counts? Sportsmen's club, forsooth! I think the quotation should be changed to "An honest sportsman is the noblest work of God." These "side hunts" have been a curse to New England for more years than I can number, and have become as disreputable as "thrown" horse races, to say nothing of the game killed out of season; and the slaughter of those in season in such quantities at one time as to be of no benefit to any one. The game dealers in our markets about this season, and up to past the holidays, find ready sale for "high" game of all kinds to the above genre, for barrels and barrels are purchased to go into the counts of sides. "All is fair, etc."

WHEELING, W. VA.—In the first week of this month a meeting of the gentlemen of Wheeling, W. Va., was held, the object being to form an association for the protection of game, and a committee was appointed to report a plan by which the fish and game laws of the State could be enforced, and such amendments be secured as would serve the purposes of the present acts.

The Evening Standard, of Wheeling, devotes a column to this topic, and we quote its excellent comments on this interesting subject:

The difficulty with the present statutes seems to be that no one is specially interested in, or responsible for, their observance. True, this is the case with a majority of the laws enacted, the only interest in seeing them carried out being the general desire entertained by good citizens to have civil authority respected, and the responsibility of having all properly constituted laws enforced, resting equally upon grand jurors and other officers of State. But as a matter of practice, the fish and game laws of this State are practically nullities. We do not mention any prosecution for their violation; and yet we know that such violations are frequent and flagrant. The reason may be partly found in a belief that prevails among some people, that no harm can come of such violations; that the supply of game and fish in this State is inexhaustible, and that pot-hunters and midnight seiners may be permitted to ply their vocation at all seasons, without fear of any serious or lasting injury. That this belief is erroneous, nobody who has given any careful attention to the depletion of many of our fish streams and the gradual destruction of accessible hunting ground through continual and murderous shooting at all seasons, needs to be informed; but there are a large class of people who never give the subject any careful consideration, and are indifferent as to an inevitable result which they do not appear to fully realize. \* \* \* We earnestly advise that the sportsmen of other counties of the State follow the example set them by their brethren in this county and organize for the purposes indicated. Such associations have proved of incalculable advantage in other States, and if west legislatures to improve and keep up our own fish and game supply, it must come through similar co-operation on the part of those most interested with the civil authorities.

LAND-LOCKED SALMON.—Dr. John P. Ordway, President of the Massachusetts Fish and Game Protective Association, has caused warrants to be served on John Bacon, M. A. Snell, Henry Snow and Levi Perkins for each having in possession one land-locked salmon. All pleaded guilty and were fined \$10 each without costs, it being their first offence. Our Fish Commissioners have, at a large expense, stocked our own waters with these fish, and the above association proposes to see that all violators of the law are punished. The close time is from the first of October in each year to the following first of April. These fish came from Ellsworth, Me., where the close time is similar to our own, and bad, by the large gashes in their sides, been evidently speared on their spawning beds.—Boston Journal, Nov. 10.

VIOLATING THE GAME LAWS IN NEW JERSEY.—In October last, Charles Collins was arrested in Camden, having in his possession five rabbits, which it was alleged he held in violation of the game laws of New Jersey, which do not permit the killing of that kind of game until the first of November. Mr. Collins was arraigned before the Mayor, and his hearing was postponed in order to allow him to bring evidence to show, as he alleged, that he had killed them in Maryland, where the game laws did not prohibit shooting them at the time of the killing. Mr. Collins giving security for his appearance. Mayor Ayres gave him a hearing in the case, and, as the defendant did not show lawful possession of the rabbits, he ordered a fine of five dollars for each rabbit, as the law provides, making an aggregate of twenty-five dollars and costs. Mr. Collins thereupon appealed to the Quarter Sessions, giving bonds for the penalty, in case the decision is against him there. Peter Roulette, of Da Costa, Atlantic County, was fined by the West Jersey Protective Society \$15 and costs for shooting quail out of season. The complaint was made some time ago.

—We are informed on very reliable authority that contraventions of the Connecticut game laws are becoming more and more frequent. Quail and woodcock have been shot all this year out of season; and what is worse, the provision dealers seem to invite pot-hunters to commit these outrages on the laws.

CANADA, Nov. 16.—Canadian sportsmen and the authorities generally complain of the wanton and wholesale destruction of deer in the townships of Beauce and Compton, Lower Canada. Pot-hunters from Maine cross over the lines, and shoot without license, and it is quite possible that some precautions are not taken, the deer will be exterminated. There is talk of sending a special force to rout out the depredators.

## OUR WASHINGTON LETTER.

PARTRIDGE SHOOTING IN LOWER MARYLAND—DUCKING ON PATUXENT—JACKSNIPES HAUNTS IN THAT LOCALITY—THEY ARE NOT SHOT IN AUTUMN, ETC., ETC.

[FROM OUR OWN CORRESPONDENT.]

WASHINGTON, D. C., Nov. 17, 1877.

The Chesapeake Bay and its estuaries probably afford good sport to those fond of aquatic shooting as can be found anywhere on the Atlantic coast. The wild fowl which frequent these waters, both in variety and numbers, exceed the found in any other section, and from the first of November until late in the spring, there is always good shooting. If it is not the abundance of ducks and geese alone which make this locality so attractive to the sportsman. The surrounding country is filled with partridges (*Ortyx virginianus*), ruffed grouse (*Umbellus bonasa*), jacksnipe (*Gallinago veltiana*), ortolan (*Porzana carolina*), reed bird (*Dolichonyx oryzivorus*) and other varieties in season too numerous to mention. There is no time of the year, except spring and autumn, when the birds are breeding, that the sportsman cannot find his pleasure here.

In a recent letter I described at length the ortolan and a bird shooting on the marshes of the Patuxent, near Nottingham, Prince George County, Md., and in this one I hope to interest the many readers of FOREST AND STREAM with something about the partridge and duck shooting in that locality which seems to have been an attractive place for sportsmen many years ago. In a recent conversation with a gentleman—now seventy-five years of age—and for the greater part of his life a resident of this section, I spoke of the partridge shooting there being good, and by that I meant it was a matter for a fair shot to bag from twenty to thirty birds a day. This gentleman, who had been an ardent sportsman in his younger days, assured me that in that locality thirty years ago the partridges were so plentiful that he, in company with a friend, killed a two-bushels bag full in two days' shooting. To use his own words, "They were as plentiful as blue birds." Every field there of any extent had a dozen or more coveys in it. Of course they are not so plentiful now, but Mr. Maccubbin, who keeps the very comfortable hotel in the village, informed me a few days ago when I was there, that the fall of 1870 he found fourteen coveys in a single stubble field of about 200 acres. There has been a great increase in the destruction of birds during the past thirty years on account of the larger number of persons engaged in it, some for pleasure and others for profit. Besides, the constant distance of them on their feeding grounds scatters them over a greater extent of territory and causes them to forsake their favorite haunts.

The "Bald Eagle" plantation, which fronts immediately on the Patuxent, a short distance below Nottingham, covers over a thousand acres, much of it in stubble fields, affording excellent feeding grounds for the birds. The cover on the farm, which they seek when disturbed by the sportsman, is not at all difficult to penetrate, consisting of briar patches, thickets along branches and ravines, in which a well-bred dog can easily find the birds. Just across the river in Prince George County and in Anne Arundel County, a short distance above and opposite to the village, are numerous stubble fields, affording good breeding grounds for the birds, and consequently attractive places for sportsmen. Mr. Maccubbin is popular with all his neighbors, they accord to his gun the privilege of shooting on their farms, knowing, as they do, that they are gentlemen who shoot for sport only, and not for market; besides, the farmers there have no fear of their poultry being molested or other depredations being committed, as such an act would receive its merited condemnation not only from Maccubbin, but others in that section as well as visitors, and the offender would not be a welcome guest at that place afterward. The farmer in this section whom I have met are intelligent and courteous, there is none of that selfishness among them which prevents gentlemen from enjoying himself on their fields. Thus partridge shooting in this section affords such delightful sport it is fully equalled by the

## DUCK SHOOTING

to be found on the Patuxent, from the mouth of the river to Hill's Landing, a distance of sixty or seventy miles. One of the greatest features of the pleasure here is the enjoyment of both partridge and duck shooting without any great consequences. The sportsman stopping at Nottingham can arise about daybreak, walk a couple of hundred yards to the river, where he will find his boat and man to paddle ready, Maccubbin always having experienced boatmen employed to convey his guests to the most desirable shooting grounds, and such places are plentiful all along the river, run of fifteen minutes either up or down stream bring the sportsman to some feeding point for the ducks in one of numerous creeks winding through the marshes. The "Waunk-a-pins" (a local name applied to an

CONLIN'S GALLERY.—A match of rapidity and accuracy was held on the 19th at Mr. Conlin's gallery. Rules.—To shoot one minute and a half, loading and firing, best score to win. Dr. Dudley scored 74 in a possible 100, winning the gold badge, Mr. P. Lorillard, Jr., making second score. Dr. Dudley secured the badge, having won it three times.

**ZETTLER'S GALLERY.**—The following scores were made at Zettler's Gallery on Nov. 13. Possible 50; Creedmoor target reduced.

|                  |    |                   |    |
|------------------|----|-------------------|----|
| P Kleisrath..... | 48 | L G Bentse.....   | 44 |
| A E Moore.....   | 47 | D L Beckwith..... | 44 |
| G Zettler.....   | 47 | G A Schurman..... | 43 |
| M B Engel.....   | 46 | M Dorrer.....     | 40 |
| B Zettler.....   | 46 | G Perry.....      | 40 |
| F Dill.....      | 44 | W Weigandt.....   | 40 |
| J Fenning.....   | 34 | R Zimmerman.....  | 40 |
|                  |    | G Connor.....     | 40 |

**ZETTLER RIFLE CLUB.**—Annual election of officers of the Zettler Rifle Club, held Nov. 13, 1877, at 207 Bowery. The following named gentlemen were elected: President, M. L. Riggs; Vice-president, M. B. Engel; Treasurer, G. G. Zettler; Secretary, G. A. Schurman; Captain, B. Zettler. Finance Committee—W. M. Farrow, G. Connor, J. Dutil.

**Buffalo—Crossley's Gallery.**—The following fine scores were made on the 14th:

|                      |   |   |   |   |   |   |   |   |    |
|----------------------|---|---|---|---|---|---|---|---|----|
| L P Kirchnunger..... | 5 | 4 | 5 | 4 | 5 | 5 | 4 | 4 | 45 |
| F Perkins.....       | 4 | 4 | 3 | 5 | 5 | 4 | 5 | 5 | 45 |

The first score won.

**SOUTH CAROLINA—Columbia, Nov. 16.**—The State Fair held here annually brings a very large number of visitors, but this year an extra attraction was offered in the way of a prize drill and prize rifle match, open to the United States; and the whole of our little State, and representatives from Virginia, North Carolina, Georgia, were also present. The prize drills came off yesterday. First prize, \$400, open to any militia company in the United States, was won by the Governor's Guards, of Columbia, S. C. Second prize, \$100, open to any company in the State, was also carried off in splendid style by the same company. Rifle match, open to the State militia, was participated in by several teams from different parts of the States. Range, 200 yards; Creedmoor target; army rifles, six-pound pull, open sight; off-hand; teams of six men, in full uniform of company, to be allowed one sighting shot and five regular shots. The shooting was poor, with a few exceptions, the Charleston team sweeping everything. Below I give the four best scores out of possible 150:

|   |     |
|---|-----|
| German Fusiliers, of Charleston, S. C.....        | 119 |
| Sumter Guards.....                                | 109 |
| Richmond Hussars, Augusta, Ga.....                | 102 |
| Civilian Rifle Battalion, of Charleston S. C..... | 100 |

The best individual scores were made by Messrs. Williams and Jopp of the German Fusiliers, both making, on first round, 23 out of possible 25. On shooting off the tie Williams made a bull's-eye and Jopp a centre. The Sumter Guard team deserve a great deal of credit, as they were the youngest team on the ground, and have been practicing but a short time. **YENOTS.**

**SAD ACCIDENT TO A MARKER AT WEST ALBANY.**—The *Troy Times* of the 15th gives the following account of a fatal accident at the range in West Albany: "A number of gentlemen, among whom were Drs. Haskins and Lansing, proceeded to West Albany for the purpose of enjoying a half-day's long-range practice. All of the marksmen lay in a recumbent position, the result of each shot being signaled by Clapper. In due time Dr. Lansing's turn arrived. Taking long and careful aim, the physician fired. The party waited several minutes for the 'marker's' signal, but none was made. A glass was then brought to bear upon Clapper, and he was found to have fallen from his upright position. The party hastened in alarm to where he lay, and found him dead. An examination was made by the physicians, and it was ascertained that Dr. Lansing's bullet had passed directly through the poor man's heart, producing, it is supposed, instantaneous death. Clapper's father was a witness to the shooting, and saw his son fall. As to Dr. Lansing's proficiency with the rifle, the *Argus* says: 'Dr. Lansing was regarded as one of the best marksmen in the city, and his proficiency had almost passed into a proverb, he being called, among his associates, "Old Reliable." There was no negligence on the part of any one, and the family of the deceased exonerate Dr. Lansing from blame.'

—Leading riflemen in England are still contributing most interesting letters to the *Volunteer Service Gazette*, in regard to their defeat in the United States. Mr. Herbert P. Miller, a portion of whose communication we published some time ago, has another excellent letter. We regret our inability to give it *in extenso*. Mr. Miller begins as follows:

I fear the majority of your correspondents have so far misunderstood me that they imagine I attribute the late American defeat wholly to an inferiority in the British rifles, but, in fact, I merely suggested the probability that they might be defective as compared with the American arms; and, to my mind, nothing has yet transpired to shake that "probability." Major Young states in his last letter that "some of the British team have supplied themselves with American rifles;" that looks as though some of them, at least, thought there might be a superiority in the American weapons. From the first, every impartial mind must have felt that the English team, man for man, was quite equal to anything that Americans could bring against them, and that if they failed it must be due to the rifle, the system, or to both, and this premise has been verified. In spite, however, of all equalization, natural weaknesses will no doubt assert themselves. This brings us to the point I have been trying to enforce all along—namely, that if our team again fails it shall be from natural weakness, and not from any defect in rifle or system. It should be remembered that superiority, after all, is but a matter of contrast. It is not enough to show that our Rigby and Metford muzzle-loaders are splendid arms, which they undoubtedly are; but the point is, are they in all respects equal to the American breech-loaders? If Major Young will pay as much attention to a good American breech-loader as he has done to the Metford, and if he then declares the Metford to be best I shall be ready to accept his conclusion; but unless he does this his experience is worth but little as a comparison of rifles. "The competitor who has just made all bull's-eyes with his Snider, experiences a feeling almost of contempt as he passes the small-bore man who has failed to do equally well." Why is this? Because he understands the Snider, but knows nothing about the small-bore, and so he deludes himself that the Snider must be the best. In our love for what we have, is it not possible that we may be deluding ourselves about the quality of the American rifles? At any rate the point is sufficiently important to call for a competitive trial before some such tribunal as suggested in my letter to you to you of October 24. Clearly, the very

first step to be taken in the matter is to be quite sure that our team is armed with the very best rifle that can be got.

In a former issue we assured Mr. Miller that he was in the right direction, and we believe, as perhaps does this gentleman, that it is more a matter of rifles than drill. The conclusion of Mr. Miller's letter is mainly in the extreme:

It appears the American N. R. A. has declined to alter the conditions of the Centennial Trophy contest, so as to exclude any British teams but the one selected by our N. R. A. After all, this is hardly a question for the Americans, but rather one for ourselves. They, no doubt, wish to avoid treading on the dangerous ground of a private quarrel. Although the invitation to shoot in the contest was, apparently, given to the three kingdoms, the promoters left us at liberty to decide whether we should come singly or collectively. Ireland, Scotland, England, have each been beaten individually. If, then, there ever was another occasion for our firmly uniting for a common purpose, surely now is the time. Let us show, like the man and his wife, that if we quarrel among ourselves, we know how to combine to beat a stranger. Some riflemen of the sister kingdom seem to object to the term "English," "British," etc.; then let the next team be sent out under the style and title of the "Combination Team." For n y part I do not care a single pin what we are called so long as we win the match.

—The prizes won by the Twentieth Battalion team at Glendrake this fall are on exhibition in the show window of Winter's book store, on John's street, Kingston. They are two groups of bronze representing the personal combat of the Duke of Richmond and Richard III at Bosworth, and the combat of James Fitz James with Roderic Dhu.

For Forest and Stream and Rod and Gun.

### THE RIFLE ON RUNNING DEER.

BY T. S. VAN DYKE.

NO. I.

In nearly all countries where large game is at all shy, or is much hunted, the greater number of chances to kill will be on the run. Of the many thousands who are increasing the ranks of votaries of the rifle many will doubtless be anxious this coming fall and winter to try their skill in the field. And many of those who figure most successfully at Creedmoor and the galleries will be greatly astonished to find how little their skill at the target, even when combined with extraordinary skill with the shot-gun, will at first avail them in the field on moving game. Shooting on the run with the rifle is an art that every thorough sportsman should by all means learn. In many places it is absolutely indispensable to any sort of success. And even where it is not, the satisfaction of overhauling a bounding deer with a single ball is so intense that good running shooting on game casts even the best of shot-gun shooting far in the shade.

The number of successful running shots, even among good hunters, is surprisingly small. I know several men who have killed over 500 deer, who do not hesitate to admit that they never have even scratched hair on one running. I know many good hunters who never even attempt it. Upon this important subject almost all sporting books are remarkably silent. From hunters who can shoot well on the run little or nothing is to be obtained in the way of information. Some of them cannot analyze the process; while others, especially those of the real old, or "Leatherstocking," type, are prolific only of winks and shrugs, suggestive either of some mysterious gift which nature has bestowed upon them alone, or else of some marvelous secret too precious to be even breathed to common mortality.

That it is a difficult art to acquire cannot be denied. But the difficulty lies principally in the fact that a person almost invariably commits certain blunders which are always fatal to success. And these he will rarely discover, or even suspect, until he has wasted a large number of splendid chances and been dozens of times mortified far past the swearing point by seeing deer skip unharmed away almost within buck shot range. As an illustration of this I might cite the case of Col. Gildersleeve on his first performance last spring on the Creedmoor running deer target. Here was one of the most noted riflemen in the country, and, as I understand, a good shot with the shot-gun, making only one hit out of thirteen shots. And this on the easiest kind of shooting, with nothing to excite him, at a known distance and with the motion of the deer and all other conditions uniform. And yet this was nothing whatever to be ashamed of, but only what hundreds of as good off-hand short-range shots as he have done in the field to a far greater extent. I freely admit that I have done even worse.

I purpose, in as brief a manner as possible, to point out these errors and put the lover of the rifle, who wants to try the noblest and most exciting of all hunting, in a position where he will be as well qualified to go ahead as if he had lost a hundred or more deer in working out this information for himself. Of course nothing can entirely supply the place of practice. But I know of no case in which directions will not go far toward doing so. Because if left to yourself you will almost certainly fall into errors which you may easily avoid if forewarned.

Supposing you to be a good off-hand shot on standing game, which is an indispensable pre-requisite, let us go to the field and try a deer running. The deer is the hardest of all large game to hit (other things being equal of course), and if you can learn to hit him well everything else of his size will be easy.

For the best work you must have a moderately coarse front sight that is easily caught and held by the eye. Ivory is, except on snow, the best of all for this, though in most lights either brass or silver are very good. Cut off those "horns" or sides from your back sight, filing it down until you can clearly see the whole body of a dog over either side when the front sight is held from one to six, or eight feet ahead of him at a hundred yards. File it with a forward slope to the top edge to prevent the reflection of the sun, and blacken or rust it with iodine, or acid. The advantage of this I will mention hereafter, though it will soon be evident to you.

The first mistake you will be apt to make when a deer jumps (especially if used to wing shooting with the shot-gun) will be to forget your sights, catch a shot-gun aim and blaze away. Therefore bear constantly in mind that you have a rifle and not a shot-gun in your hand, and think of it first thing when he springs. After a while you will have no trouble to recollect it.

There are five principal ways in which running shots will present themselves, and all others are only variations of these. 1. A broadside. 2. A center, or "loft" broadside. 3. The same, straightaway. 4. The same, "quartering," or at an acute angle to the line of fire. 5. Broadside, straightaway or quartering, with high springs more or less irregular both in height and length.

The first of these is the easiest; but still you must do no careless work, for it is wonderfully easy to miss even this shot. Let us suppose a deer on a trot at right angles to the line of fire and distant about 75 yards. A deer seldom takes this gait and rarely holds it for more than a few yards, but it will be the best to begin on. Now be careful, don't be in a hurry, recollect there is plenty of time, and that haste will be almost certain to make you miss him. First throw your rifle ahead of him tolerably low, and catch as full, clear and distinct a view of both

your sights as you would in a target prize match, and be sure you don't lose it. Make the sights the first thing in order of importance; next get your eye on the deer. Of course this will, or should, be practically all one act. I only mean to make the deer second to the sights in order of importance. Now, either bring your rifle up to him, or let him come to it until it is about one and a half or two feet ahead of his breast and a little below the line of the centre of his body. Be very cautious about getting it too high. Now pull.

He jumps, runs a few paces, plunges and falls shot just back of the shoulder, nearly three feet from where you held. You see, if you had held on his middle you would have missed him.

Let us now try one on the lope. This is the next easiest and is, I presume, the movement of the Creedmoor running deer. [The Creedmoor deer glides along on tramways.—Ed.] If it should be, to be of much value as practice. Now catch your sights as before; but instead of firing as soon as you get the proper distance, follow him for several jumps until you get the length and height of his jump. Try to fire just as he is at the highest point of his bound, and hold about where you think he will be when he comes down, regulating the distance ahead by his speed which is now greater than when trotting. If he runs low you may disregard the up and down motion, and shoot as you did before, with no allowance for anything but his forward motion. But if he runs high you must not disregard it unless he is going to be out of sight in a jump or two, or is running very fast, in which case you must of course risk the other method. There are two ways in which you will be very apt to miss this shot. 1. By shooting too far, or not far enough ahead. 2. By shooting too high. Unless very cautious you will shoot at the elevation at which he is when in the air, which will bring your ball just a few inches above his back as he strikes the ground.

Let us next try one quartering. This is on the same principle as the last. But with this difference—that even after you have learned to hit broadside shots you will be unconsciously deceived into overlooking, or forgetting the absolute importance of shooting ahead of the spot you wish to strike. Even if running at an angle of only twenty degrees to the line of fire, and only a few yards off, it will always be prudent to see a few inches of daylight to front of his breast. If you are not careful you will find yourself involuntarily holding on his ramp, or middle; and just so sure as you do just so sure you will miss or only scratch him.

The next one is a straightaway lope. Here there is no forward motion to allow for. You catch a full, clear sight on his stern and pull. "You see the dirt fly from a little knoll beyond, just in line with him, but just over him."

"Strange!" you exclaim. "I had a splendid sight on him."

Not strange at all. You only made the most natural blunder in the world. You shot at the highest place where he was and hit it very nicely. But he wasn't there. He had just left it and your ball was an instant too late to catch him. It was all right to shoot when he was in the air, but you should have held from twelve to eighteen inches lower.

Thus far our deer have been loping with a very regular bound. But deer do not always run so. Where the ground is rough, rocky, brushy, or covered with logs or fallen trees a deer's gait is generally very different. He now goes with quick, high springs, very irregular both in height and length according to the nature of the ground. After what you have seen you will readily understand that this is the most difficult of all. And you will understand it still better after you have shot at a few of them. In the other cases the rise and fall is not always so great as to make its calculation indispensable. But now, just so surely as you hold where he is, just so surely will your ball strike where he is not. You need not now be at all ashamed of a miss, for anything like certainty is even much less attainable than it was before.

The only way to reach a deer going this way is to keep perfectly cool, take plenty of time, remember that haste will be utterly useless, and follow him patiently for a few jumps with the rifle not quite so far ahead as in the regular lope. Shoot when he is in the air, from one and a half to three feet below his highest point. Sometimes you will have to shoot still lower, as when he is running through a windfall crosswise and clearing a big log at every jump or two. In such case, unless you have a good side view of him, you had better hold your fire until he gets on more open ground. And you had better always do so unless the windfall is a large one, or you have a repeating or double rifle. For the chances are against you on every shot. Still, with care, some wonderful shots may be made in this way which will make you stand a moment in delighted amazement and break into an ejaculatory soliloquy that would be amusing to your friends if they could hear it. One deer stopped in this way will give you more satisfaction than a dozen killed standing, and you will chuckle over it for the next three weeks. In my next article I will give some general hints that will go far toward helping you in your practice.

*Miner's Rancho, San Diego Co., Cal.*

### A DUCK-STEALING BAGGAGE-MASTER

NEW YORK, Nov. 12, 1877.

EDITOR FOREST AND STREAM:

I would like to warn the sporting fraternity against the thieving proclivities of the employees of the Southern R. R. of Long Island. A friend and myself had the good fortune to shoot a few ducks at South Oyster Bay, and the misfortune to deliver the same to the baggage-master of the Sunday afternoon train to New York (yesterday). This worthy suggested that we "ought to give him some of them for minding them;" but as we had no little trouble and hardship, and some expense in procuring them, and had a good use for them, we suggested that any regular charges we were willing to pay, but were under the impression that the R.R. company were the parties supposed to pay him for attending to his business. His conduct aroused our suspicions, and four separate times we went forward to the baggage-car and looked at the birds to see if they were all right. On reaching home and setting to work to divide up our game preparatory to sending it to different friends, we discovered that four of our best birds (two black ducks, one broad-bill and a red-head) had been deliberately cut off from the bunch. The thief had evidently tried to untie them, but could not succeed, and had cut off the bodies, leaving necks and heads for us to count and swear over. As we believe the committee investigating the affairs of this road find that it has been unable to protect itself from the depredations of its employees, it is perhaps asking too much that they should protect the travelers on the road. But the writer would give \$25 for the satisfaction of punishing that baggage man whom he believes stole the birds, or if he did not, allowed some one else to do it. As I have previously lost game on this road, I think it is well to call the attention of sportsmen to the matter, that they may keep a look out, as I shall do in future.

Would have sought redress from the company, but the question arises, "Who is the company?" Perhaps the *Times*, which has followed the matter, might inform us. I inclose my card and that of my friend, G. C. B.

—Messrs. Tiffany & Co. have notified the General Inspector of Rifle Practice that the "marksmen's badges," to which the bars for the present year are to be attached, must be delivered to them during the present week, in order to insure their completion before the rush of work entailed by the holidays begins.

THE ST. AUGUSTINE YACHT CLUB.—The extent of John Bull's territory is proverbial; doubtless the intensely English Englishman may sail his own yacht on loyal English waters in every clime of the globe. Rather suggestive is it, too, of the extent of Brother Jonathan's yachting waters, that, just now, while northern yachtsmen have snugly housed their craft ere the rigging shall become stiffened with ice and the decks whitened with snow, their amateur brethren of the craft in another part of the country are but preparing for the season's sport. And what a delightful harbor the St. Augustine Bay is for a regatta, too, with the quaint old town, far stretching seawall and Spanish fortress on the one side of the course, and on the other the low-lying marsh, white sand hills, and the breaking surf beyond. And fully as unique in their way are the sports that in the olden times used to fill up the programme of the day. We wonder if they have departed with the glory of other days? The greased pole with eager youngsters climbing up for the ham or purse on its top; the chase and scramble for the well greased pig; the diminutive darters attempting to nose out pennies from a barrel of flour; and all those other contests equally dear to the heart of the natives and of the stranger within their gates. But these reflections of the past must give place to the facts of the present. Of the present success and workings of that energetic organization, the St. Augustine Yacht Club, with many of whose members we are personally acquainted, we learn from the St. Augustine Press of a late date:

Very notable and agreeable improvements have been wrought in and about the building of the St. Augustine Yacht Club during the past few weeks. The principal room of the interior has in particular undergone quite an essential change, having been enlarged by the carrying back of partitions upon the shoreward side, and superbly lined and paneled upon the inner faces with selected samples of our native pine, which, as oiled and polished, give to the whole an appearance decidedly unique and baronial. A substantial chimney, with broad fire place, has been built up at centre of the room upon the north side, paneled around in like manner with the walls at large, while at front, above the things of the hearth and jambs, appears a mantel (also of native wood), which for harmony of proportion, and general artistic merit, is a sample of workmanship to admire. Overhead a light tint of pearly gray has been laid on, with a dark shade for rafters and braces, affording a pleasant effect. A fine tank of iron has been provided for the side rooms for a supply of water, and other accommodations useful and desirable. At the south or wharf side as you enter, as also at the east and northern fronts, new doors have been placed, double and glazed, and with top lights, giving fine lookouts and full ventilation and air. In addition, a broader and more ample window lets in at the southern side a flood of light for the benefit and convenience of readers of the numerous papers and magazines with which the club will be supplied during the season. Without, and opened upon by the doors at the north and east, a substantial piazza has been established, supported from beneath by pillars of the cabbage palm—impervious to borers or other vermin of the sea—and capable of sustaining all the company, both of ladies and gentlemen, that may crowd upon it during regattas or other displays or entertainments by the club. Steps leading downward to the water at the Bay-front afford facilities for entering or landing from lesser craft of whatever sort. Altogether the provision thus made for comfort or convenience of members of the St. Augustine Yacht Club together with friends or guests has been successfully as well as most tastefully carried out, rendering the club building with its accessories still further an ornament and acquisition to the city. The Secretary of the club, Dr. J. H. Janeway, U. S. A., has exercised no less good taste and judgment in the general direction of the changes made, and certainly deserves well of the organization for his pains and attention. Mr. Kinzie has been chief carpenter in charge, displaying, with his assistants, capacity and skill at all points. Ingraham, colorist, stainer and varnisher, cannot ordinarily be surpassed by the best of city workmen from any quarter. That the success of our yacht club may be equal with its efforts in all regards, to establish and maintain itself among us, is the wish of all.

—Erison, of Williamsburg, has just built for W. L. Alden, of the N. Y. C. Co., a canoe of a new pattern which the owner believes to be far better for cruising purposes than is any canoe hitherto built. The Shadow combines all the best features of the Nautilus, Rob Roy and Rice Lake models, with none of their faults. It is fifteen feet in length, twenty-eight inches beam, and weighs sixty pounds; and will draw when fully loaded not more than three inches. The keel and hulls are oak, the planks are white cedar and the deck Spanish cedar. Mr. Alden is well known as the writer of the cleverest articles in American journalism, but what the public are not well acquainted with is that the American "Sixth Column Man" of the New York Times is a distinguished canoeist.

# New Publications.

## MAGAZINES.

Perhaps the most noteworthy contribution to the December monthlies is Longfellow's poem, "Keramos," in *Harper's*. The subject is one which affords abundant scope for the fancy and imagination, and the poet has given us a poem of which the burden is the idea of change. The turning and moulding of the clay in the potter's hand is typical of the ever changing fashion and thought of the race:

Turn, turn my wheel! All things must change  
To something new, to something strange:  
Nothing that we can pause or stay:  
The moon will wax, the moon will wane,  
The mist and cloud will turn to rain,  
The rain to mist and cloud again,  
To-morrow be to-day.

The illustrations, which are by Abbey and Fredericks, add to the text instead of detracting from it, as is so often the case. The magazine opens with Milton's grand "Hymn on the Nativity," illustrated by Fredericks. As a Christmas poem nothing could worthily compete with it. Other illustrated papers are, "Elizabethan and Later English Furniture," a study by Mrs. Harriet Prescott Spofford of the Decorative Art in England Since the Renaissance; "The Metropolitan Newspaper," by Mr. William H. Rikling, a writer who not only selects good subjects, but treats of them in an effective way. The paper is illustrated with twenty-seven illustrations, including views of the principal newspaper offices and prominent New York editors. Mr. M. D. Conway contributes a description of a recent visit to Jamrach's, the famous London animal depot. It will be remembered that Mr. Jamrach's establishment was some time ago described in *FOREST AND STREAM*. This number is especially rich in fiction. Among others, Miss Thackeray begins a new story, "Da Capo;" E. E. Hale concludes his story, "Back to Back;" Rebecca Harding Davis has a short tale, "The Man in the Cage."

In *Scribner's*, R. H. Stoddard contributes a valuable paper to the study of English literature in a paper on Keats. The paper is partly biographical and partly analytic of the poet's genius, and the writer assigns the poet to a very high rank. Mr. Stoddard's thorough study of his subject and his eminent qualifications for his task, have conspired to make the present paper worthy the careful attention of every student of the English poets. Col. Waring's spirited article on "The Thoroughbred Horse" contains many valuable suggestions about training for the turf and riding to hounds, and a picturesque description of an English fox-hunt. Among the illustrations are several reproductions of Leech's famous cartoons in *Punch*. Speaking of the relation of the American farmer and the fox-hunter, Mr. Waring says:

The question that arises in this country, when the introduction of fox-hunting is suggested, is that of the composition of the farmers. The sport involves the protection of foxes, resulting in a certain amount of damage to poultry, and more or less injury to fences and crops; but these objections could probably be removed by some proper system of compensation. What is here more serious would probably be the question of trespass; and certainly, as farmers are their own landlords and are subject to no restrictions, such as are imposed in the almost universally prevalent leases of England, it would, of course, be in the power of any farmer, or other land-owner, to forbid entering upon his land. One or two objections in a neighborhood would suffice to make anything like satisfactory work impossible. This could be overcome, if at all, only by establishing such relations between the hunter and the farmer as exist almost everywhere in England. There, farmers themselves enter very eagerly into the sport, and enough of them ride regularly to establish a public sentiment in its favor, and to drown any objection that might arise in their own class. When damage is done to poultry or to fences or to crops, compensation is always given by the master, but it is considered not at all the thing to ask damage unless the injury has been quite serious. After all, the account is found to be very largely in favor of the farmer, even though he is subjected to some loss from the causes referred to above. Fox-hunting invariably brings into the country a very large number of horses, creating a demand for forage on which the extra profit over the price it would bring in a distant market is very far beyond the damage done. In Pennsylvania, Delaware and Maryland, where fox-hunting is still kept up, no serious difficulty has arisen, largely for the reason that the whole, or nearly the whole, of the hunt is made up from the ranks of the farmers themselves.

"The Wooden Age" is a description, by Chas. D. Robinson, Esq., of the lumber trade of the United States. The life of the lumberman, with all the exciting and novel features of his life, are excellently portrayed. The paper also contains some statistics worthy of attention among those who see in the not far-off future the destruction of our great forests. The total number of products of the country Mr. Robinson estimates at the almost incredible amount of 10,000,000,000. "American Oyster Culture" is the title of another paper in which another American industry—the culture of the succulent bivalve—is treated in an appreciative spirit by James Richardson. Besides the statistics, which are not obtrusively prominent, there are excellent descriptions of the

whole system of oyster planting and gathering, with much valuable and entertaining information about the life of that selfish shellfish. Another contribution to natural history is the paper of Mrs. Herriek on "Ants," which, as usual with her essays, is accompanied with excellent illustrations from her own pencil. Lieut. E. W. Sturdy, of the U. S. Naval Observatory, has a scientific paper on "Mars and his Moons." The travel sketch this month is from the pen of Henry Eckford, who tells us of a journey "From the Atlantic to the Andes." In the department of fiction the serials are continued. By a curious coincidence, the reader is enabled to compare the picture of early Indiana life, as given by Mr. Eggleston in "Rox," with the reality, as described by Robert Dale Owen in his interesting reminiscences of public and private life in the same part of the State. There are other sketches and stories and several poems, among which we may call attention to "Hesperus" in which Mr. Charles De Roy gives a new treatment of the theme of immortality.

With this issue the *Galaxy* completes its twenty-fourth volume and the twelfth year of its existence. It started to be the foremost literary magazine in the country. Entirely discarding mere pictorial attractions and strictly local connections, its aim has been to present each month the choicest possible literary bill of fare to its readers. It has aimed to be thoroughly up to the times in the choice of subjects which it has discussed, and most of the live questions of the day are ably treated in its pages. Its liberal policy and high literary tone have drawn to it contributions from some of the ablest of our statesmen. Many of these contributions are of the greatest importance, and give an inside view of our current history which could not otherwise be obtained. Secretary Welles has given its readers an inside view of our naval operations during the rebellion, and in his series of papers on Mr. Lincoln and Mr. Seward, has given many exceedingly interesting revelations as to the position, views and acts of Mr. Lincoln and the leading members of his Cabinet on the great questions which engaged their attention.

The opening paper this month is by Robert P. Porter, who seeks to give "The Truth About the Strike;" Gideon Welles continues his papers on the "Administration of Abraham Lincoln;" "The Florentine Arithmetician" is a Shakespearean study, by Richard Grant White. "The Youth of Charles Sumner" forms a subject for Lucy C. White. There are a number of historical, biographical and literary papers, poems and stories, book reviews and scientific notes, which combine to make this a bright and valuable number.

*Lippincott's* for December opens with an interesting and richly illustrated article on Sicily, by Alfred T. Bacon. "Captured by Cossacks," is the title of another illustrated paper, detailing the adventures of a French officer who served under Davoust in 1813. The new serial, "For Percival," also illustrated, continues to form one of the most attractive features of the magazine.

An article which cannot fail to attract much attention and excite a lively interest, is one containing the reminiscences of a venerable lady ("M. T.") belonging to the highest circles of Washington society, who was the guest of Madison, an inmate of the White House during the presidency of Jackson, and an intimate friend of Washington Irving, John P. Kennedy and other celebrities. The paper, which is full of lively descriptions and amusing anecdotes, is entitled "Days of My Youth."

T. S. Perry, the well-known Boston critic, discusses Ouida's novels, and explains the causes of their immense popularity, despite their glaring faults and the censures of reviewers. William Owens writes entertainingly on the "Folk-Lore of the Southern Negroes," and Olive Logan gives an account of "English Domesticities and their Ways." There is a story of French Internationalism, "A Portrait," by Ita Aniol Prokop. Mrs. R. H. Davis' powerful novelette, and Will Wallace Harney's tale of Southern manners, "A Kentucky Duel," are both concluded. Among the poems, "Selma," by Annie Porter, deserves notice; and the "Gossip," besides much other lively and agreeable reading, has a description of the departure of the Imperial Guards by a Moscow correspondent.

This number concludes the twentieth volume and the tenth year of the issue of this magazine.

*Appleton's* is rich in notes of travel. The opening pages are devoted to an illustrated article descriptive of a trip to "The Head Waters of the Rhine," S. G. W. Benjamin writes of "A Trip to the Bermudas," those isles of the summer sea, "where people do not die, but dry up with old age and blow away;" and Chas. H. Woodman has a sketch of "New Egypt," or the Egypt of to-day. The stories are, as ever, good and for the most part told by approved story tellers. They are: "A Night in the mountains," by Rebecca Harding Davis; "Mountain Harry, a

Character Sketch," by Ernest Ingersoll; "The Master of Rushen," by Amelia F. Barr;" "His Western Catharine," by Ella Rodman Church and the serials, "By Celia's Arbor," and "Cherry Ripe." The Editor's Table deals with a variety of timely topics, and the reviews of books of the day complete the number.

In the *Popular Science Monthly*, Prof. R. H. Thurston continues his essay on "The Growth of the steam engine," treating in the present paper of the period of development. "Star or Star Mist," by Professor Proctor, is reprinted from the *English Mechanic*; and there is a second installment of Prof. Elias Scheider's paper on "The Tides." "Modern Superstitions" is an interesting paper on a fascinating subject. "Language and the English Civil Service" is discussed by Prof. Alexander Bain. The most important article in the magazine is the lecture on "Evolution; Its Origin, Progress and Consequences," recently delivered by Prof. John W. Draper before a minister's institute at Springfield, Mass.

(To be Continued.)

FOX HUNTING GOSSIP.—The London correspondent of the *New York Times* writes entertainingly of the chase as indulged in by Englishmen, high and low:

Touching "the chase," I am reminded that the hunting season in England is now occupying the attention of that class of sportsmen who have been sung and glorified in many a hunting song, and whose adventures have been celebrated by many a novelist past and present but by none more truthfully than Lover, Whyte Melville, Trollope, and Hawley Smart. The love of the chase in England has come down to us from the very earliest days. The Norman Kings of England, old writers tell us, carried their passion for it to such an excess at one period of our history as to involve every civil right in general ruin; though there was not half as much hunting in the eleventh century as there is to-day, in spite of the vast decrease of open spaces, the cutting down of forests, and the clearance and cultivation of waste lands. In England and Wales at the present time there are not less than 150 separate hunts. In one-fourth of the districts the "meets" are four times a week, and in some cases the master of the hunt turns out a pack every five days in the week. The hardest rides in England are the followers of the Pychley hounds, the Duke of Beaufort's hounds, the Belyor and the Cheshire packs, and the Lincolnshire, though there are many other hunts almost as famous, including the Worcestershire, after which the Duke of Arundel used to ride two or three days a week at this season of the year. South of the Tweed the fox is hunted in this little island 500 times a week from October till March. Setting aside the work of our various packs of harriers and stag-hounds, it is hardly possible that the Norman barons did as much hard riding as all these "meets" represent. At least 10,000 foxes are killed every season, a pretentious big crowd of wild animals in a country so small that Americans may well wonder, without railway speed, that we don't run off it. A reliable authority assures me that hunting is more general and systematic in England than it was twenty-five years ago, and that England of the eighteenth century could not for a moment show sport by the side of the present generation of hunters and shooters. A century and a half has not elapsed since dogs were trained to hunt foxes only—a fact which I don't think has been used by Darwin in his beautiful illustrations of the perpetuation of acquired habits in animals. When Squire Western rode out with Tom Jones after a hare, Fielding had never seen 400 horsemen following a pack of hounds. At the present day 100 packs at least are turned out in the English counties every week to hunt the stag, the fox, and the hare, followed by an army of about 10,000 highly-mounted riders, as keenly interested in the chase as the dogs themselves. Englishmen are not more earnest in war than they are in the chase. Hard as "the Iron Duke" was, he had a pack of hounds with him and hunted his enemy's country during the Continental wars. Four hundred years before Wellington, Edward III., of England, had sixty couples of stag-hounds and a hundred harriers with him during his brilliant campaign in France. The music of the hounds in the chase was delightful to the ears of Homer. The late Lord Derby translated the "Iliad" and gloried in a lively run. Among literatures of the present day, Trollope still follows the hounds. Leech, who drew such admirable hunting caricatures in *Punch*, made his sketches from real life. Kingsley followed the hounds. Whyte Melville delighted in the chase. Fielding, the most realistic writer of the eighteenth century, hunted regularly. Palmerston, the judicious Minister, enjoyed the sport.

—On the 17th of this month in London, William Gale completed the terrible task of walking 4,000 quarters, or mases in 4,000 consecutive periods of ten minutes each. This feat has then walked for 27 days, 18 hours and 33 minutes. The *Lancet* calls such efforts "Suicide by Pedestrianism." In reference to Gale's last performance the *Lancet* says: "There are several ways of attempting suicide. The undertaking, alike absurd and peculiar, now being carried out at the Agricultural Hall by Gale, is one of the most and must be too soon or too strongly denounced. It is not pedestrianism so much as interference with the demand for sleep, which is just as imperative as the demand for food. If a man deliberately set himself to abstain from food for six weeks, the law would soon let him know that he is not to do so. Why should the law act differently when a man shows his insanity by persistently abstaining from rest? Such feats are not entitled to be regarded with any respect. We should be glad to hear that Mr. Cross had given notice to all our readers that in the event of any serious results, they would be held responsible. It is with great regret we find a member of the medical profession according the sanction of his presence and support to the proceedings.

ROSE WATER AND ATTAR OF ROSES.—As is generally known, this district is the most fertile in the Turkish empire for the production of attar of roses; and, as little is known of this curious and interesting process, a few words as to how the roses are grown and how the essence is extracted may be permitted. This district, which is called the district of Kezanlik, produces annually more of the essence than all the other rose-growing districts of Turkey put together. The whole quantity produced in Turkey may be roughly estimated at 3,600 pounds annually, of which 1,800 pounds are manufactured in this district and the rest in seven other districts, all alike in the Sandjak or province of Philippolis. The soil best suited for the cultivation of roses is what we find in such large tracts of land in this neighborhood, namely, sandy slopes with a southern exposure, and the method of planting and rearing is as follows: In spring and autumn parallel trenches a few inches deep are dug in the soil selected about 1½ yards apart, and in these trenches are placed short branches taken from an old rose tree. These must not be cut off the old plant, but torn off, so as to carry with them part of the root or bark of the plant. They are placed in the trench so as to form a continuous line, and the earth, with some manure, is then filled in. In about six months small plants begin to show above the ground, but bear no roses until the second year, and these are of no great value. The third year's crop is fit for the production of the essence, and by the fifth year the plant is at its best. It remains in this condition for several years, but after about fourteen or fifteen years the quality of the roses has so deteriorated and the bushes grown so thick that replanting is necessary. By this time they may be six feet high. The rose tree is a very delicate plant, and requires constant care. As the crop of flowers advances toward harvest time the cultivator has to make a kind of rough estimate of the quantity of buds and flowers that he must gather each day. This is limited by the amount of labor he can command to pick the young full-blown roses before sunrise and by the quantity he can distil at one time. For the sun soon dispels the scent, and the flowers must go immediately into the still. Thus supposing he sees or judges that it will take ten days for the whole crop to come to perfection, he must in the first morning gather a tenth of his crop, and proceed to distil that quantity, and this will explain why a sudden burst of heat forcing on the whole crop is so disadvantageous. It also appears that any great heat during the time of distillation causes the quality of the essence to deteriorate. The distillation is carried on in the most primitive manner, and yet seems to answer the purpose as effectively as would any more complicated or scientific method. The still itself in form resembles a large copper bottle, with a neck consisting of a smaller chamber. The height of this still is about five feet. From the top a pipe passes into a receiver, through which the distilled water passes. Into this still is placed a quantity of roses with ten times as much water, and the distillation is carried on until the amount of liquid in the receiver equals in weight the amount of roses in the still. The roses are then thrown out and a fresh quantity put in, and the process is repeated until all the water is evaporated, when a fresh operation begins. The liquid thus obtained is rose water, which is again subjected to distillation, when the real essence is produced in the form of a pale yellow oil. The quantity of essence that a given number of roses will produce is very uncertain, but a rough average may be taken that to produce one pound weight of the essence it requires the astonishing weight of 28 cwt. From this may be gathered some idea of the enormous amount of land occupied and labor bestowed on the cultivation of roses in this district alone, which annually produces upward of 1,800 pounds to 2,000 pounds weight of the essence. There are no large farmers of roses. The rural population have the manufacture entirely in their own hands, and every man that has a small field of roses has also his distilling apparatus. Very often among the poor Bulgarians this constitutes their entire capital, with a small field of maize, a few plum trees and a few vines.—Letter from Shipka Pass to the London Times

How IT LOOKS TO A LUNATIC.—The following dialogue is reported as having taken place between a gamekeeper and a patient looking through the iron gate of a French lunatic asylum: Patient.—That's a fine horse. What's it worth? Keeper.—Five hundred dollars. Patient.—And what did that gun cost? Keeper.—One hundred dollars. Patient.—And those dogs? Keeper.—Eighty dollars, I believe. Patient.—What have you got in that game bag? Keeper.—A woodcock. Patient.—Well, now, you had better hurry on, for if our governor catches a man who has spent \$650 to get a woodcock worth 30 cents he'll have him under lock and key in no time, I tell you.

Tiffany & Co., Silversmiths, Jewelers, and Importers, have always a large stock of silver articles for prizes for shooting, yachting, racing and other sports, and on request they prepare special designs for similar purposes. Their Timing Watches are guaranteed for accuracy, and are now very generally used for sporting and scientific requirements. TIFFANY & CO. are also the agents in America for Messrs. PATEK, PHILIPPE & Co., of Geneva, of whose celebrated watches they have a full line. Their stock of Diamonds and other Precious Stones, General Jewelry, Artistic Bronzes and Pottery, Electro-Plate and Sterling Silverware for Household use, fine Stationery and Bric-a-brac, is the largest in the world, and the public are invited to visit their establishment without feeling the slightest obligation to purchase. Union Square, New York.

### Sportsman's Gazetteer

AND  
GENERAL GUIDE,  
By CHARLES HALLOCK,  
Editor "Forest and Stream and Rod and Gun."

896 pp., Price \$3.

Tinted Paper, \$4; half-bound mo., \$5.

A complete Dictionary for Sportsmen. Everybody wants it that has a dog, gun or fishing rod. A complete description of all kinds of Game, Fish, etc. Field sports, Woodcraft, Angling, Fly Tying, Dogs, Dog Breeding, Diseases and Treatment, Boating and Boat-building.

Several thousand localities where game and fish are to be found.

Nothing of the kind ever before published worth ten times the price.

PUBLISHED BY  
FOREST & STREAM PUBLISHING CO.,  
111 Fulton street, New York.

## NEW YORK SHOOTING COAT.

A stylish, handsome Coat. First-class in every particular. Pleasant to wear, durable, and in the end the cheapest.

MADE OF BROWN VELVETEEN.

Pockets and lining made to take out, so that it may be worn for early fall and winter shooting. (Horace Smith, Esq., says: "It is my idea of a shooting coat. I have worn them for several years, and would have none other.") Price for Coat, \$25; Vest, \$6.50. Also the best brown corduroy pants at \$10 per pair. I make only the one grade, as the cheapest goods do not turn brains and will not give satisfaction.

Also, in addition to the above, I am making a Waterproof Canvas Suit, cut same style as the Velveteen; goods, not stiff and hard, but soft and pleasant to wear; guaranteed to turn water. Sportsmen who have seen it say it is the Best Yet. Coat, \$6.50. For full Suit, \$14.00. I also make the Sleeveless Coat; Vest with sleeves if desired. Rules for measurement and samples sent upon application.

F. L. SHELDON, Rahway, N. J.

For Sale by Dealers in GUNS and SPORTSMEN'S SUPPLIES.

## THE UNITED STATES CARTRIDGE COMPANY,

LOWELL, MASS.

Manufacturers of the

CENTRAL FIRE, SOLID HEAD,

Excelsior  
Scroll Saw

Double Treadle, including one dozen  
Saws, thirty inimitable Fret Sawing  
Patterns and prepared Wood, to the  
value of \$4. A new device for tightening  
Saw, Power Drilling attachment,  
Wrench, Oil Cup and Screw Drivers  
Speed, 800 strokes per minute. Saws,  
13-1/2 inch wide. Price complete, cases  
and delivered on board cars or at Ex-  
press office, \$12.

Saw only, without attachments, \$9.

SMALL STEAM ENGINES.

With Copper Boiler, to drive light  
Lathes, Scroll Saws, etc. Are all sizes  
from 1-2 to 2 horse power; either  
plain castings, partly finished, or com-  
plete, ready to use.

The "Scientific American" of June 10,  
1875, says of the above, in an extended  
editorial, introducing our manufactures  
to the public: "It can turn writers,  
churns, washing machines, or ice cream  
freezers, run coffee mills, pump water  
through a house, actuate foot lathes,  
scroll saws or light box-making machinery,  
run knitting or sewing machines, turn  
a grindstone or emery wheel, work ven-  
tilating or hand thrashing machine cut-  
ters, meat or feed choppers, or sausage  
machines, drive small blowers for pneu-  
matic dispatch tubes in a building, or for a  
blacksmith's forge, or compress air or work  
an air pump on a small scale in a laboratory.  
These are a few of the purposes to  
which it can be applied."

Also Engines and Boilers capable of propelling  
15 to 18 inches. The boats have keel, stem,  
with rudder and tiller, row locks and oars.  
These wishing a pleasure boat will find

NEARLY ONE THOUSAND IN USE.  
Buffalo Pony Planer. Will earn it  
self and pay expense of running in 7  
days. Price from \$50 upwards,  
each.

LIGHT MACHINES FOR PONY  
OR HORSE POWER.

The great success of these machines  
is unprecedented, and it may be con-  
fidently affirmed that no article has  
ever more clearly proved its superi-  
ority for the quantity and quality of  
its work than this. It is made in  
several sizes, and can be fitted up  
suitable for bullock, mule, steam or wind power, in addition  
to those above mentioned.

Patented March 30, 1875.

Best of its kind in use.

Price, complete, \$75-  
Also Planing Machine  
Knives, which are recom-  
mended as superior and  
extra in quality.

Buffalo Excelsior Pony Planer and Match.

Patented March 30, 1875.

## Gale's Patent Tents,

Adapted to all purposes  
where Lawn, Beach,  
Hunters' and Camp Tents  
are used; are elegant and  
high, seven feet square  
at bottom, will lodge four  
persons; can be set up or  
taken down and packed in  
five minutes, making  
a bundle four feet long,  
or twenty-five pounds  
weight. The pole in two  
parts, is joined together by a brass tube. They  
are wonderfully light, and yet very strong, and  
are the handiest and cheapest tents extant. Samples  
of goods and price list sent free, and the cost sent  
on receipt of price, or C. O. D. Prices from \$10 to  
\$15.

### Guns, Rifles, Etc.

### W. W. Greener's CHOKE-BORE GUNS, Tried on Game in America.

Supplied by H. C. Squires, 1 Cortlandt St., NEW YORK.

### See the Following Testimonials:

SIR—It is a pleasure for me to inform you of my high appreciation of the W. W. Greener breech-loader purchased of you last winter. I consider choke-boring, if skillfully done, as the greatest improvement in fowling-pieces since the introduction of the percussion cap. It gives the maker complete control of the pattern, and greatly increases penetration. To prove this, I will give you the performance of this gun. The 31-inch 16-gauge barrels, charged with 4 1/2 drachms of powder and 1 1/2 oz. No. 6 English chilled shot, give patterns ranging from 25 to 330 pellets in 3-inch circle at 40 yards. The same charge of powder and 1 1/2 oz. No. 4 American shot gives 161 to 176 patterns with penetration which kills ducks at 6 to 7 yards like a stroke of lightning. It is a characteristic of the choke-bore to show its greatest superiority in the large sized shot. What I am about to say will perhaps surprise you as much as the performance surprised me. On trial of the 13-gauge 28-inch modified choke-bore barrels, with 3 1/2 drachms of powder and 1 1/2 oz. of shot, I got about the same pattern and spread of shot at 25 yards as with the full choke 16-gauge barrels at 40 yards, with tremendous penetration. This is just the performance required of a gun for thick cover, in which you generally find ruffed grouse, woodcock and quail, those bird-choking killing, with few exceptions, at from 15 to 25 yards.

COL. JOHN BODINE.

DEAR SIR—The guns arrived all right. We think these last guns you have sent us will place the Greener guns ahead of any other in this country, as guns of other makers don't compare in shooting qualities with them. We unhesitatingly recommend the Greener as far superior to any gun of foreign or domestic manufacture that we have seen. We say this after seeing and using guns of all the most celebrated makers.

CARLISLE, JONES & CO.

SELMA, Ala.

The Greener gun presented by Mr. Squires for the best pointer, and awarded to me, is a close, clean, hard hitter killing its game at very long distances. It is the second Greener that I have owned and they cannot be beaten. A win with them at the trap or in the field.

S. B. DILLE.

LAKE CITY, Minn.

SIR—I have a pair of W. W. Greeners breech-loader bought of H. C. Squires, of New York, modified choke-bore. I have had an opportunity to test these weapons on birds heavily feathered, and where great penetration was essential to success. I have repeatedly made long shots, always killing the game clean. At a far distance both guns made a very even distribution of the shot, with extreme penetration.

F. C. FIELD.

SIR—The Greener breech-loader I purchased of you is very fine indeed, and gives great satisfaction. WARRICK, Pa. ROBERT DENNIS ON.

W. W. GREENER, St. Mary's Works, Birmingham, England.

### EDWIN HACKETT,

LATE OF

### HACKETT BROTHERS,

NOW READY,

## THE Sportsman's Gazetteer

AND,

## GENERAL GUIDE.

WITH MAPS AND ILLUSTRATIONS,

900 pp., Price, \$3.

BY CHARLES HALLOCK,

EDITOR OF "FOREST AND STREAM," AUTHOR OF THE  
"FISHING TOURIST," "CAMP LIFE IN FLORIDA," ETC.

NEW YORK:

"FOREST AND STREAM" PUBLISHING COMPANY.

The book is a complete manual for sportsmen:

It gives every sportsman like method for capturing every known game animal, bird and fish in North America.

It designates the proper charge for guns for each kind of game, the various kinds of decoys and blinds, and baits and tackle for the fish.

It gives over 4,000 localities where game and fish may be found, specifies the game found in each locality, the hotel accommodation, and the best route to get there. (The preparation of this Directory was in itself a work of great magnitude.)

It gives the scientific name and specific characteristics of each species it describes, with the habitat and breeding season of each—a most valuable contribution to science.

It describes 22 varieties of edible fish alone, that may be taken with the hook; 50 varieties of ducks; 50 varieties of snipe or waders, and the different methods of shooting each.

Its instructions for capturing large game are very minute, and the chapters on woodcraft, outditching and camping have been pronounced by "El Cazar," of Los Angeles, California, to be simply complete.

Every kind of gun used for sport is designated, and his print for the judgments fully given. The chapters relating to selection, breeding, rearing, breaking, care and diseases, comprise a seventh part of the volume. There are 71 prescriptions and recipes given under the revision of the best modern canine therapists.

It is in itself the most concise, accurate, instructive, sensible and comprehensive work ever written upon the dog and his diseases. Any physician can administer the prescriptions with perfect confidence in their safety and efficacy.

It contains very useful recipes and remedies for wounds, bites, poisons, illness, and emergencies of all kinds; for cleaning, repairing, and preserving every implement used for sport; for selection and use of every kind of boat employed by sportsmen; a reference list of several hundred books in request by sportsmen, and a directory where to buy outfitting goods.

It instructs in taxidermy, and tells how to preserve and mount specimens of animals, birds and fish.

### Ronan's Metal Shell Cleaner.

Cleans fifty shells in ten minutes. No water used. Knives elastic, self-adjusting, prevent the slipping of waste. Is used as a wrench wider by covering with an oiled cloth. For sale by all gun dealers, or sample sent free by mail on receipt of price, \$1.50; 10 and 12 bore. J. F. RONAN, 733 Shawmut Avenue Boston, Mass. (Liberal discount to the trade)

## Warren Powder Mills,

MANUFACTURERS OF

BLASTING AND MINING, SHIPPING AND SPORTING GUNPOWDER.

**SPORTING BRANDS**—Eureka, Continental, "Border Ride," Snap-Shot, and Warren Sporting Cannon and Musket, U. S. Standard. The above can be had of the dealers, or at wholesale at the office, 27 Doane street, Boston, Mass., and of the agents, **JOHN P. LOVELL & SONS**, corner of Washington, Cornhill and Wattle street, Boston, Mass., 1719

## HAZARD POWDER CO. MANUFACTURERS OF GUNPOWDER.

**Hazard's "Electric Powder."**  
Nos. 1 (fine) to 6 (coarse). Unsurpassed in point of strength and cleanliness. Packed in square canisters of 1 lb. only.

**Hazard's "American Sporting."**  
Nos. 1 (fine) to 3 (coarse). In 1 lb. canisters and 6 1/4 lb. kegs. A fine grain, quick and clean, for upland prairie shooting. Well adapted to shot-guns.

**Hazard's "Duck Shooting."**  
Nos. 1 (fine) to 5 (coarse). In 1 and 5 lb. canisters and 6 1/4 and 12 1/2 lb. kegs. Burns slowly and very clean, shooting remarkably close and with great penetration. For field, forest or water shooting, it ranks any other brand, and it is equally serviceable for muzzle or breech-loaders.

**Hazard's "Kentucky Ride."**  
FFFG, FFG, and "Sea Shooting" FG, in kegs of 25, 12 1/2 and 6 1/4 lbs. and cans of 5 lbs. FFG is also packed in 1 and 1/2 lb. canisters. Burns strong and moist. The FFG and FFG are favorite brands for ordinary sporting, and the "Sea Shooting" FG is the standard Rifle powder of the country.

**Superior Mining and Blasting Powder.**  
GOVERNMENT CANNON & MUSKET POWDER; ALSO, SPECIAL GRADES FOR EXPLOSION OF ANY REQUIRED GRAIN OR PROOF, MANUFACTURED TO ORDER.

The above can be had of dealers, or of the Company's Agents in every prominent city, or wholesale at our office, 33 WALL STREET, NEW YORK.

## THE New Dittmar Powder.

THE CHAMPION POWDER OF THE WORLD  
For all off-hand shooting at short and long ranges. Unsurpassed for Cleanliness. Pleasant to shoot on account of little recoil and report. Desirable for hunting on account of little or no smoke. Unhindered for rapid firing, as it does not foul and heat up the barrel as black powder. Great accuracy, penetration and good pattern. Safer than black powder. Address

CARL DITTMAR, NEPONSET, MASS.

## BOSTON

## SHOOTING SUIT.

Manufactured only by

**G. W. SIMMONS & SON,**

BOSTON.

Each article—coat, trousers, vest and hat—have the name and manufacturer's address stamped upon it, and no suit is genuine without it bears this imprint.

The suit can be sent, securely packed, by mail to any part of the United States or Canada on receipt of \$1.25 above the price of the suit.

We make no discount except to the trade. We make but one quality, and that is the VERY BEST. The price of the suit complete is \$13.

The suit consists of coat, trousers, vest, and choice of either cap with havelock, or hat.

The material is of the best quality of duck, waterproofed by a patent process. The color is that known as "dead grass shade."

The seams and pocket corners are riveted, and nothing is neglected to make the whole suit complete in every way.

### OUR PATENT DECOYS

have entirely superseded the old-fashioned cumbersome, wooden decoys. The birds are hollow, and six of them occupy about the space of one wooden decoy. The Duck Decoys of all kinds are \$12 per dozen: geese, \$9 each; yellow leg, \$4.25 per dozen; black breast plover, \$3.75 per dozen; red breast plover, \$3.75 per dozen; golden plover, \$3.75 per dozen; turnstone, chicken plover, etc., \$3.75 per dozen; sandpipers, \$3.50 per dozen. We are now making standing geese for field shooting.

### THE HUNTER'S TENT

is made of tan-colored duck; light, easily transported. Size, 7 ft. by 8 ft. Price, \$10 complete, made on the umbrella principle, folding into a neat roll 3 feet long.

In the judges' report at Philadelphia they were commended for excellence in every part. Very novel and practicable; adapted to all out-of-door purposes where lawn, beach, hunters and camp tents are used; quick folding; all sides strongly fortified; enables them to stand against wind and rain. Rev. F. B. Savage, of Albany, N. Y., who camps out in Florida in winter, and the Adirondacks in summer, writes this about the tents:

ALBANY, July 31, 1877.

Sirs—I have just returned from a three-weeks' camping expedition in the Adirondack, and have had the three tents bought of you put to the severest tests of exposure both to wind and storm, and I do most unhesitatingly say they are the most complete thing of the kind I ever used.

1st. They are easily put up or taken down.

2d. They are perfectly waterproof.

3d. They are a good height, and all the room I available.

Our party asked for no better. They were admired by all who saw them, and one party insisted on buying one of ours that was to spare. Rev. Dr. Duryea, of Brooklyn, and the Rev. Dr. Irwin, of Troy, both endorse what I say about your tent. With kind regards, yours truly,

F. B. SAVAGE.

### Tan-Colored Leather Pliable Waterproof Suits.

In Shooting Coats, Jackets, Breeches, Vests and Hats at following prices: Coats, \$22; Breeches, \$15; Jackets, \$18; Vests, \$12. These form the most elegant shooting equipment known. They are indestructible.

A recent notice in the FOREST AND STREAM from a correspondent, says:

Whenever a sportsman, or even one who does not claim the distinction, finds a really good and useful article, it is no more than fair that he should let others have the benefit of his knowledge. For this reason we would call attention to the Tan-colored Leather Shooting or Fishing Suits, made by G. W. SIMMONS & SON, of Boston, Mass., the manufacturers of the famous "Boston Shooting Suit."

I saw these goods advertised in your paper, and wrote to the parties for samples. I found the material as soft and pliable as a piece of kid. I tested it by soaking in water twelve hours, and found it as nearly waterproof as one could desire, and after drying was happily surprised to find it had not stiffened in the least. I have since then received a full suit—coat, vest and breeches—ordered by letter from measure taken by myself.

The goods are splendidly made, well lined with flannel; in fact I do not see how they can be improved.

My friends are unanimous in their verdict that G. W. Simmons & Son's leather goods cannot be excelled in quality or beaten in price.

For every kind of sportsmen's goods address

## SHONINGER ORGAN

PRONOUNCED UNANIMOUSLY AS THE

## Best Instruments

Their comparative excellence is recognized by Judges in their Report, from which the following is an extract:

"The B. SHONINGER ORGAN CO. has made the best instruments at a price rendering it possible for a large class of purchasers, having combination of Reeds and Belts, producing pleasing effects, containing many desirable improvements, will stand longer in dry or damp climates than any other organ, and the boards being three-ply, put together so it is impossible for them to either shrink, swell or split." THE O. ORGANS AWARDED THIS RANK.

This Medal and Award was granted after a severe competition of the best makers, before the most competent jurists ever assembled. New styles and prices just issued, which conform with our rule, the BEST value for the least money.

We are prepared to appoint a few new agents. Illustrated Catalogues mailed, postpaid, on application to

**B. SHONINGER ORGAN CO.**

### THE "FISHING LINE."

Brook Trout, Grayling and

Black Bass Fisheries

OF NORTHERN MICHIGAN, VIA

Grand Rapids and Indiana Railroad.

(Mackinaw, Grand Rapids, & Cincinnati Short Line.)

Sportsmen who have cast a fly or trolled a spoon in

the waters of the Grand Traverse Region will

again without solicitation. All other lovers of the

Rod are invited to try these waters, wherein

The fish named above, as also Muscunonge,

Pike and Pickerel, abound.

In no other streams east of the Rocky Mountains

is the famous American Grayling found in such

numbers.

Brook Trout Season opens May 1st.

Grayling Season opens June 1st.

The sportsman can readily send trophies of his

skill to his friends, or "Club" at home, as ice for

packing fish can be had at many points.

Take your family with you. The scenery of the

North Woods and lakes is very beautiful. The air is

pure, dry, and bracing. The climate peculiarly

beneficial to those suffering with hay fever and

asthma.

The Hotel Accommodations, while plain, are,

as a rule, good, far surpassing the average in coun-

tries new enough to afford the finest of fishing.

On and after June 1st Round Trip Excursion

Tickets sold to Points in Grand Traverse

Region, and attractive train facilities offered to

tourists and sportsmen; also, on and after July 1st,

Mackinaw, and Lake Superior Excursion Tick-

ets.

Dogs, Guns, and Fishing Tackle Carried

Free at owner's risk.

Camp Cars for Fishing Parties and Families

at low rates.

It is our aim to make sportsmen feel "at home" on

this route. For Tourists' Guide, containing full in-

formation as to Hotels, Boats, Guides, etc., and ac-

curate maps of the Fishing Grounds, send to FOREST

and STREAM office, or address

Ten Cents a Copy.

NEW YORK, THURSDAY, NOVEMBER 29, 1877.

Volume 9.—No. 17.  
No. 111 Fulton St., N. Y.

### THE OLD OAK TREE.

"T IS a gray old tree, and its branches three,  
With thin, red leaves, sere and dry,  
Like giants old, still grim and bold,  
Frown up 'g the Autumn sky;  
Yet once it stood  
In the dark green wood,  
A sapling, young and slight,  
Which the deer might crush  
In his onward rush,  
Or the whiffwind in its might.

But hush! let us hear from the aged seer,  
His story of wonders bold;  
Many and oft, were the strange sights seen  
Ere his eyes grew dim and old.  
Hark! hear him speak  
To the breezes bleak,  
As they whirl his dry leaves round;  
His voice is hoarse,  
And gruff, and coarse,  
Yet w'at'hal, 'tis a pleasant sound

"I was born in the Spring, when the breezes sing  
Glad songs to the opening flowers;  
I budded and grew, while the year was new,  
In the shade of my parent bowers;  
Since, many a Spring,  
On the rapid wing  
Of Time, with his hoary head,  
And many a tree,  
With its leaders free,  
From our beautiful home have fled.

"I'm bound by a spell, and I may not tell  
The wonderful things I've seen;  
To oblivion's shade, a vow have I made,  
To whisper them not again."  
E'en as he spoke,  
The "Storm King's" stroke  
Passed his hoary and scathed head o'er;  
Down, down to the ground  
He sank, and the sound  
Of his voice was heard no more.

As the howling storm, o'er his prostrate form,  
Swept on in his pathway dread,  
A sad song passed on the wailing blast,  
Like a requiem for the dead.  
"Oh, proudly he stood  
In the dark, green wood,  
A long, long time ago;  
But mourn for the Oak,  
His heart is broke,  
And he lieth now full low."

For Forest and Stream and Rod and Gun.

### A Canadian Fishing River.

MOST of us have looked forward with keen excitement and pleasant anticipation to summer excursions, on whatever line they lead us, whether it be that of the resorter to fashionable spas or those of less ambitious character; whether they be of Acadian quiet and simplicity of country retreats, far away not only from the bustle of the city, but even of rare communication with it, or of village cottages surrounded by but a patch of garden, with green fields to wander in. Even the less pretentious trips, which last but a few days, create a zest and desire for them which tell of innate feeling of love of enjoying the freedom from the every-day life consequent upon a city existence; the pallid influence which seems to paralyze the capacity of rural felicity in the inhabitants of towns and cities. By no means the less enjoyable amusement is that of the sportsman; and in making his purchases prior to a trip he experiences an almost childish delight in anticipation, not only of the pleasures, but the dangers before him; for the quiet and passive river often becomes a boisterous and death-threatening rapids.

Not long since I felt these variations of feeling on a fishing excursion to one of the many fishing rivers near the city of Quebec. It was difficult to make the choice of any one in particular, for we had tried nearly all those within a radius of thirty miles and were ambitious of trying new waters, where few had ever thrown the fly, and where we might, in the solitude of the primeval forest, broken only by the cry of bird or the sound of the wind—"where," one might say, "man never trod before," and sit by our own camp fire and cook the trout whipped by ourselves from lonely streams. After many suggestions, *Le bras de Nord de la Rivière Ste.*

*Anne* was decided on. Our knowledge of it was vague in the extreme; the way to it even was unknown to us, for information regarding it we could not at the time procure. But to it we were determined to proceed, and our after experience taught us that our decision was right, and that we had indeed hit upon the beau ideal of fishing rivers and wild beauty.

The north branch of the River St. Anne, also called the "Little Saguenay" from its almost savage scenery, rises in the mountains of the Laurentian Range and falls into the main river of the same name, which empties itself into the St. Lawrence, some miles above Quebec. Its rocky sides rise precipitously to the height of several hundred feet, and its many rapids render the descent of it in boats a difficult and dangerous undertaking. The country at the upper part of it is wholly uninhabited, and is covered with a dense forest. The consequence is that few but fishermen and sportsmen visit this beautiful and rugged locality. Countless trout shoot the many rapids, or linger in the deep frigid pools of the St. Anne River, and any follower of Izaak Walton may easily entrap many dozens a day.

It was mid-summer—in the dog days—when the frightful heat hurried all who could snatch such liberty from the boiling city to the seaside or to country retreats. The burning pavements were trodden by few pedestrians; the Venetians were tightly closed to shut out the glaring sun, and darkened rooms were sought after by prostrate humanity. Water carts paraded up and down the streets, deluging the thirsty earth, and panting dogs hid themselves in grateful shades. It was mid-summer, and the heat and *ennui* had become intolerable, when I joined the party to try the fishing in the St. Anne River. We were three men—Mr. Torrance, Mr. Percy and myself—and Mr. Torrance's three boys. The purchase of provisions and fishing tackle did not long detain us, and we started from the North Shore Railway station at Quebec at about six o'clock in the afternoon. The first-class carriages had not then been placed on the line, and considering that the road was not completely ballasted, we found the wooden benches rather uncomfortable. This, however, was made up by the courtesy of Mr. Robetaille, the conductor, and the exactitude with which Mr. Robetaille, the engineer, kept up to time. Fortunately the wreckers had not then commenced their diabolical attempts, and we safely arrived at Pont Rouge, or rather Ste. Jeanne de Neuville, as the village is called, in about an hour and a half. Since the building of the North Shore Railway, this village has made rapid strides. Where before there were but few houses, are now erected handsome stores and villas. Near by, the wild River Jacques rushes down its stony bed, and in its waters may be seen the lordly salmon plunging and leaping. Here we engaged two back-boards, and on them we placed ourselves with the luggage and drove on to St. Raymond, about eighteen miles distant, where we arrived about midnight. St. Raymond is delightful; well built shops and dwellings strike one with surprise, for we can scarcely expect to see such signs of prosperity as here represented. A fine church, whose walls inside and ceilings are beautifully frescoed, stands in the centre of the village, through which runs a broad street, flanked by wide wooden sidewalks. The river St. Anne runs alongside, and is here crossed by a substantial bridge. Mr. Savary, a prominent villager, very kindly lent us his tent, cooking utensils and a flat which we tried to transport over sixteen miles on an abominable road, which ran over a succession of mountains, so that it was approaching evening before we reached our destination and camping ground. The latter part of our journey was made through the primeval forest, the road having gradually dwindled to nothingness or a squirrel track up a tree. The two men whom we had brought with us from St. Raymond were perfect woodsmen and *chasseurs*. In a very short time our tent was set up in a charming spot on the bank of the river, a fire lit and supper being prepared—a supper of bacon, eggs, trout which we had quickly taken from the river, bread, butter, tea and coffee. Our hunger satisfied, and weary with our long drive and prostrated by the intense heat, we gathered ourselves together in the tent and prepared for slumber. But we reckoned without our host, for myriads of flies—black flies, sand flies, mosquitoes—attacked us so furiously that we were in a short time a mass of bites. The smoke from the immense fire in front of our tent seemed only to exasperate them. Sleep was banished, and we surrendered in a kind of despair to our merciless foes. They seemed not

to trouble the two *chasseurs*, but devoted their united energies to us from the city. Sullenly and anxiously we waited for the break of day and then hurried to plunge into the cool water to refresh ourselves and allay the inflammation of the bites. The bath was delightfully cool, and in some measure relieved us from pain, and the boys could hardly be induced to leave it even for our *al fresco*—breakfast—after having despatched which we prepared for fishing. Our tent was pitched upon the bank of a certain cove in which the water was somewhat shallow. Outside, the current rushed down tumultuously and a precipitous wall, fringed at the summit with luxuriant herbage, guarded the further side. On either side of the tent was a grove of maple trees, while in its rear was a sort of uncultivated field filled with raspberry bushes and strawberry plants rich with their luscious fruits. The beautiful maples completely shaded our tent, and in front of it was built a huge fire to keep off the flies and to cook our meals. Alongside the fire the *chasseurs* had erected a sort of inclosed miniature shed, beneath which our provisions were stored, and they themselves rested secure from the attacks of the sun's rays and descending showers of rain.

We divided into two parties—Mr. Percy, with one of the boys and a *chasseur*, in one boat, and myself, with the two other boys and a *chasseur*, in the second boat. Mr. Torrance remained in camp, he having suffered so much from fatigue and the flies that he felt too much indisposed to venture out. In truth, so much did he suffer that later in the day he despatched one of the men to the nearest house—ten miles off—for a horse and vehicle, and returned to St. Raymond to wait for us on our homeward trip. The whole day unceasingly we fished up and down the river, sometimes running rapids, at other times poling up against the stream, the flies all the while continuing their ferocious attacks and onslaughts. The wild beauty of the scenery of the river is indescribable. At its every turn new scenes of grandeur meet the eye, and one becomes lost in admiration, and bewildered with the varied and picturesque views constantly charging the sight. At one time we find ourselves quietly floating over an inky pool, whose surface is disturbed by whirling eddies and covered with froth and bubbles. In these deep pools lie the monster trout, which give to the sportsman a chance to play his spotted victims and show his skill. From the edge of the river, on each side, rise perpendicular rocks, seeming almost to lean toward each other at their high summits of several hundreds of feet above us, while stunted trees and shrubbery overhang the stream from their rugged sides. At another time the troubled waters rush over a pebbled incline, with here and there huge boulders standing from out the rapid, and giant forest trees of birch, beech, maple, oak and fir grow up from the water's bank in an impenetrable confusion to the foot of the distant mountains, whose purple tops can hardly be discerned from the blue clouds which cover them. In parts these immense trees stretch their branches across the river, which then runs through a shaded avenue of variegated foliage. It was almost dark when we returned to camp, weary with the labor of paddling and wielding the rod, and we were glad to rest on the ground and take our supper. We had been very successful in our catch, having over thirty dozen of fine trout, often having hooked two and three at a time. As on the previous night, the dread flies remorselessly and viciously sucked our blood; but notwithstanding them we were able to snatch a few hours of slumber from the night, and woke in the morning somewhat refreshed, but terribly inflamed in all parts of the body. After again fishing in the vicinity of the camp we landed, and the men struck our tent and placed everything in the two boats for our expedition down the stream to our second camping ground. While they were thus engaged, we wandered about gathering strawberries and raspberries which literally colored the ground. At one o'clock we started the other boat, taking the lead, as the man with Mr. Percy was better acquainted with the river than the man with me, who, it turned out, was very short sighted. Consequently he endeavored to keep as close as possible in rear of the leader, and had he succeeded in doing so an accident, which very nearly caused the loss of all our lives on board, would not have occurred. There was no necessity of much exertion in paddling, as the current is strong and in some places becomes a rapid. So we drifted down the weird, wild river, whipping its surface and becoming every moment more entranced by its unique beauty. By some mismanagement our boatman allowed the leading boat to dis-

tance him, and instead of taking the right channel, was forced into a rapid which ran toward the shore under a fallen tree. In a moment our boat plunged bow foremost into the depths, and the four of us found ourselves above our waists in the water, fortunately just being able to catch hold of the fallen tree, upon which we, after strenuous efforts, were enabled to secure a position. Our camp-cooking apparatus went to the bottom, the provisions, blankets and wraps floated down the stream and were picked up by those in the first boat. After remaining nearly an hour on the tree, which was separated from the shore by over ten feet, so that we could not reach it, we were rescued from our dangerous position by the other boat. The water was at this spot twenty feet deep and the current very strong, so that had we not been able to catch hold of the tree, all would have inevitably been sucked under it and become entangled in its submerged branches without the possibility of extricating ourselves. We congratulated each other on landing at our second camping ground with but the loss of our cooking utensils and fishing rods and the several dozens of trout caught on the way down stream. By the time our tent was set up, a fire built and our wet clothes hung up to dry and a change put on, supper was ready and the shades of night had fallen upon us. Our camping ground was close to the river's edge, in the midst of a dense forest, and the flies, if it were possible, even more vicious. Our supper—the cooking utensils having been lost—had to be prepared in true Indian style. Pieces of bacon and the fish had to be suspended over the fire by a bending twig, while, in place of our tin pannikins, the *chasseurs* manufactured cups out of the inside skin of birch bark which did not leak even one drop. On account of the flies, the intense heat, the excitement caused by our accident, it was utterly impossible to sleep, and the weary vigil of the dark hours seemed never to come to an end, while continuously through the dark hours a night-owl dolorously screamed its mournful notes. The fire in front of the tent lazily burned through the night, and was now and then fed by the two *chasseurs*. Toward morning I thought it had died out completely, but I felt its heat, yet could not see the flames. I had become blind. I put up my hand and found that my eyes were completely closed; the inflammation from the bites had so greatly increased that my power of vision was lost. Calling to one of the men he procured me some cold water, with which for half an hour I bathed my eyes, and at last could discover a thin streak of daylight. I continued bathing till sight was restored sufficiently so as to see where I was going. While the boys were taking breakfast, Mr. Percy and myself took one of the flats—a most unsteady one—to try our luck in fishing. We had paddled to the middle of a pool, and were beginning to cast our lines when, by an unfortunate step by him, the flat was upset and we were both thrown into the water, which was pretty deep. Fortunately we both could swim, and with a few strokes reached land. The occurrence was so ludicrous that neither could help being convulsed with laughter, which brought the *chasseurs* to our assistance, and we recrossed the stream to the camp, while they righted and bailed out the treacherous flat. We had not a third change of clothes, so were obliged to undress and cover ourselves with blankets, while our clothes hung on branches of trees dried slowly before the fire. The sight was certainly amusing; Percy wearing but a blanket of deep blue, and myself one of glaring red, sat lugubriously smoking our consoling pipes before the pinewood fire, blazing up high amid a foliage which prevented us seeing the smallest particle of the blue sky, which no doubt covered our canopy of leaves. Sitting thus at the opening of our tent with the two *chasseurs* lazily enjoying their calumets of peace, we might, either of us, but for our rather Saxon appearance, and the absence of warlike weapons, have been taken for Sitting Bull, or one of his war-loving companions. My friend and myself were taciturn; the *chasseurs* were gloomily silent, and the three boys were amusing themselves in the boats far away, and thus the time passed in a dreary, silent solitude, unbroken even by the sad owl which had so continuously kept up his mournful cry throughout the previous night. One sound, however, remained unceasing, one annoyance was unabated; the buzz of flies and their exasperating attacks.

By this unlucky accident our morning's fishing was lost, and when we could put on our clothes the time had arrived for us to continue our course down the river. After partaking of a midday meal we again struck tent, loaded our flats and started. The incident of the previous day made me more watchful of my *chasseur*, notwithstanding which we several times ran the risk of shipwreck by colliding with boulders and fallen trees and hanging branches. The scenery, as we descended, was of the same wild and magnificent character, varied here and there by immense sand-hills which sloped down to the water's edge. Large flocks of wild ducks now and then flew over our heads, and we could hear from far above us their short cry. In the autumn partridge and woodcock are here in profusion, while in winter the ptarmigan from the north are found in multitudes, and caribou are in plenty. Many a well-known sportsman from Quebec and elsewhere come here to fill their game bags and seek the excitement and enjoyment of a hunter's life. One can imagine, but not describe, the wonderful picture this wild country must present when in the fall the leaves change their color; what a beautiful and variegated panorama must be seen, and when one could enjoy it without the torment of black flies and mosquitoes.

In some places the river narrowed between low banks covered to the water's edge with trees of long spreading branches, which hung so near that it was with difficulty we were able to pass under them. Then it would suddenly widen, leaving to our view terrace after terrace of rocks on each side, which appeared to us like castellated battlements, which rose upward till lost in the high heavens. Grand old natural castles, more ancient and more imposing than any on the far famed Rhine. As rapidly again would the scene change to shores fringed with wild waste of strawberry, raspberry and blueberry bushes, behind which magnificent plantations of birch and maple trees hid from view the surrounding mountains. An autumnal coloration to such grandeur bewilders the imagination, and in ecstasy we allowed our rods to idly dip into the stream, and our boats to dreamily float downward while we gazed upon the glorious picture. Our trip was soon coming to an end. We in a short time arrived at a sort of lagoon or marsh, through which we waded our flats, and where the heat was almost suffocating and sickening, and the flies agonizing. It led us to the foot of a hill, up which we carried our *impedimenta*, and reached the house of a noted *chasseur*, Mr. Morance, where we enjoyed the luxury of garden strawberries and cream and delicious milk from an ice cold dairy. Here we were met by our horses and vehicles, and we started on our return to St. Raymond, where we arrived in the evening, and found our indisposed friend wholly recovered and very thankful that he did not present the dilapidated appearance we wore—inflamed faces covered with bites, and torn garments.

We put up at Pelletier's Hotel, and sat down to a bountiful repast to which we did full justice. Rising at three o'clock in the morning we started for St. Jean de Neuville, and arrived there in time to take the train for Quebec, which we reached at nine the same morning, and there divided the spoil we had taken in the wild river St. Anne. O.

#### For Forest and Stream and Rod and Gun. AN AUTUMN REVERIE.

THERE is a beauty and sublimity in brown, fruitful autumn which renders it dear to the heart of every lover of nature and natural scenery. It is a season of luxury, whose praises have been sung by bards the most famous and immortal. True, the season is the harbinger or forerunner of coming winter, when the "sere and yellow leaf," blown from the branches by every fitful breeze, causes the mind to dwell on the death of the year. Yet, with all deference to that delightful poet and moralist, William Cullen Bryant, this period cannot be aptly termed "the melancholy days," "the saddest of the year," though he has maintained that theory in one of the most beautiful poems of our language. To the contrary, although the scene—as has been remarked by the lamented Herbert—presents "a hectic" loveliness, which, like the glow on the cheek of consumptive beauty, is the precursor of decay and death; still, so exquisite is that beauty, so delicious the temperature, the atmosphere, the aspect of the skies—so gorgeous the hues of forest-mantled mountain and deep woodland, that, to me at least, the promise of spring and the fullness of summer are both inferior to the serene and calm decline of the woodland year.

It is at this season that the year reaches its maturity; the red-ripe apples in the orchard, the golden sheaves of grain, the scarlet leaves of the maple—all proclaim that the harvest-time is at hand, and that thenceforward the year shall hasten onward to its close—to the cold, drear days of frost and snow. Autumn is here. It is whispered almost audibly in the soft winds which rustle in the leaves and branches; the cool breezes which fan the parched earth and bid fair nature don her fairest guise, the attire of commingled scarlet, orange, brown and emerald. The change, the transition, from mid-summer to autumn is rapid, certain and easily distinguished. The elements herald it abroad in unmistakable language. It is seen in the purple mist wreaths along the streams and lake-side, curtaining the morning sun—heard in the carols of autumnal songsters, and felt in the keen, bracing atmosphere of morn and dewy eve.

Yet, it is not until "hearty, brown October" has arrived that the full glory of autumn is attained. Then it is that the varied tints of the forest are most conspicuous, most dearly prized; when the hazy atmosphere of royal Indian summer partially veils the landscape, closing in dim and misty about the valley and hovering around the mountain side—a shimmering, gauze-like veil to the beauties of sylvan scenery. Nature, ever lavish with her charms, "beautiful in all and every guise," is now seen in the most varied and delightful garb. The deep, snowy mantle and bare branches of winter; the emerald verdure of budding spring time, or the full flush of ripe mid-summer beauty, cannot compare with the delicate tints and bright splendor of mature autumn. It outshines and outlives its sister seasons, even as vigorous manhood outlives childhood, youth and old age.

These outward attractions are visible to every observing mind, while to the sportsman this constitutes but a tithe of its real glory. With him this season is the prime favorite, not alone because of its invigorating air and grand scenery, but also in that it is the period of field sports, of the chase and of shooting. The bare, wild moor, the meadow and the stubble have for him an additional beauty, because therein are the coverts of grouse and quail. The wide spreading forest of dark emerald, brown or russet, has a new delight to the sportsman, as the resort of nobler game—the elk, bear and deer; while the sequestered bays, cool blue lakes and clear streamlets are viewed as the habitation of the finny tribe and the haunts of legions of wild fowl. Where'er he rambles—and his tours undeniably lead him through the most entrancing of natural scenery—the field sportsman, whether down in the valley, in the woodlands, on the mountain side, or the prairie, takes in an inspiration of nature pure and undefiled, such as the city exquisite or dandy never imagined, even in his visions. Here, in the deep fastnesses, he may truly and fervently exclaim in unison with "Childe Harold":

To sit on rocks, to muse o'er flood and fell,  
To slowly trace the forest's shady scene,  
Where things that own no man's dominion dwell,  
And mortal foot hath never rarely been;  
To climb the trackless mountain all unseen,  
With the wild rock that never needs a fold,  
Alone o'er steep and roaming flocks to lean—  
This is not solitude, 'tis but to hold  
Converse with nature's charms and view her stores unrolled.

The grand, the picturesque, and the beautiful in natural scenery the sportsman views at its best, untrammelled by civilization and unmarred by the resistless march of improvement.—Heaven save the mark!—which defaces the most magnificent of nature's works, in the one end and aim of utility. Something of the spirit of reverence for "the good, the true and the beautiful" is firmly implanted in the bosom of every true lover of the mysteries of woodcraft or the gentle art of angling. And whether it be with dog and gun in the woods and meadow, or with rod and line along the trout stream, the sport is enhanced by the grandeur of the scenes through which he passes. All the carols of the song birds—beautiful choristers—and the refrain of the whistling quail and woodcock strike pleasantly upon his ear. In such pastimes

"There is a pleasure in the pathless woods,  
There is a rapture on the lonely shore."

Autumnal sport has been honored in elegant verse by the most illustrious disciples of the muses, and by the ablest prose writers from the days of Pliny down to the present time. No more spirited and glowing descriptions of the chase and field sports in general have been produced in modern times than the delightful prose and poetry of that gifted, immortal sportsman bard, Sir Walter Scott. His poetical effusions, as well as the sublime Waverley novels, teem with bright delineations of his beloved field sports; and his magic pen has done much to render romantic and popular both the woodman's and the angler's craft. Several of his leading characters in romance are made to exemplify his own spirit in this respect. David Gellatley is made to sing the inspiring lines:

He away, he away,  
Over bank, and over brae,  
Where the cowslow is the greenest,  
Where the fountain glistens clear.

Where the lady fern grows strongest,  
Where the morning dew lies longest,  
Where the black cock sweetest sips it,  
Where the fairy latest trips it;  
He to haunts right seldom seen,  
Lovely, lonesome, cool and green,  
Over bank and over brae,  
He sways, high away.

The enthusiastic love of Sir Walter Scott for rural scenes and pleasures seems to pervade all his writings, and his master mind has crowned with won laurels the sports of field and flood; drawing from the inexhaustible fount of his bright intellect those pen portraits of sylvan scenes which have charmed the world. Frank Forester has immortalized the Warwick Woodlands of Orange County, N. Y., to the sporting fraternity of America, and Scott has rendered the Ettrick Forest and the Tweed immortal where'er the English language is spoken. Being an adept in the chase, or—as termed in ancient times—"the noble art of Venerie," his spirited lines are not merely beautiful as poetic descriptions, but as accurate delineations of his own pastimes; the keen enthusiasm of the sportsman shining out resplendent in both prose and poetry.

With its manifold charms Autumn is truly calculated to inspire the mind of the poet and the pencil of the artist. It comes in a halo of incomparable lustre, and, as Isaac McLean, the genial bard of the woods and waters hath said:

Now when the gentle breezes  
Sweep through the fading wood,  
Tossing the scarlet maples,  
And oak leaves may be heard;  
Ere dawns the day o'er hill and lawn,  
The sportsman takes his way  
To upland moor, or woodland haunts,  
Or open breezy bay.

The bright dawn, the rosy morn and golden sun-set are viewed at their best by the woodsmen, far from the distracting hum of the city; in the primeval forest where standing upon an eminence, he may see spread out before him as a panorama, the most gorgeous of all pictures, drawn by the unerring and magic pencil of sunlight—

The hill, the valley, the lake and the stream,  
The glen and the greenwood, all bright in its gleam.

Such are a few of the allurements of autumn and autumnal field sports, better by far than the fabled waters of the Fountain of Youth to the over-worked mechanic and brain-wearied business man; a boon beyond price to all humanity—a sylvan retreat wherein all may gain health, vigor and a due appreciation of fair Nature and her works. Away from the workshop, the desk, the loom and the sewing-machine. Ho! for a holiday in the woods, to return revived and invigorated; with such an appetite and such real strength, both of mind and body, as comes only from free life in the open air.

WILL WILDWOOD.

## Fish Culture.

AQUATIC PLANTS FOR FISH PONDS.—A correspondent continues this subject as follows:

IN FOREST AND STREAM for Nov. 1st, the question is asked by a pisciculturist, "What kind of grass and weeds would be best adapted to a pond with a gravelly bottom, situated in Vermont?" Taking for granted this pond is constructed on the most approved plan, it will be deeper in the middle than at the edges, which conditions are not only favorable to many species of fish, but for the growth of numerous aquatic plants. By the margin, and to a considerable depth, many varieties of this class of plants could be grown. And those deserving of most attention by the fish culturist belong chiefly to the pond weed family (*Potamogeton*) many of which inhabit the ditches, ponds and rivers of the Northern States, and therefore would be quite at home in Vermont. In addition to *Potamogetons*, several others in Naladaceae are held in still higher esteem; and we have been informed by one who has made the habits of *Salmo fontinalis* a special study, that the Naladid *annicellia polustris* is greatly more prized by that fish than any other; and although not quite common it can easily be taken from one place to another and successfully planted. Water milfoil, too (*Myriophyllum*), and bladderwort (*Utricularia*), several of which grow under water, and have long floating stems, and fine grass-like leaves, afford, in common with the others named, quiet retreats and resting-places not only for fish and their fry, but for numberless aquatic insects upon which they feed.

But when the object is to attract winged insects to the water, another class of plants must be called into requisition, and we know of none better than the common white water-lily, several of the aquatic grasses and sedges which are distributed over a wide extent of country, and therefore easily obtainable. Some of these, however, should be planted by the margins of ponds, or on islets either natural or formed for the occasion, while others would do equally well within water mark in little bays and creeks; and in addition to luring insects thitherward they might, if properly disposed of, add materially to the picturesqueness of the scene, and thereby afford so much the more pleasure to men of taste and refinement.

The grasses we would chiefly recommend are *Phragmites communis*, *Glyceria canadensis*, *G. elongata*, *G. acutiflora*, *G. fluviens* and *G. aquatica*; *Spartina cynosuroides* and *S. stricta*, *Var. glabra*, *Calamagrostis canadensis*, *Zizania aquatica*, although an annual, is yet a noble grass, and holds no mean place in the extensive order to which it belongs. The Sedge family might be represented by quite a number of species, but chiefly by *Carex comosa*, *C. crinita* and *Pseudo-cyperus*, *Scirpus polyphyllus* and *eriphorum*. Among exogens, *Najas verticillata*, *E. jubulum angustifolium*, *palustre* and *coloratum*. *Polygonum*, *Amphibium* and *Pennsylvanicum* are well deserving of a place—some for the beauty of their flowers, others for the gracefulness of their forms. *Najas* we regard as especially appropriate, and when grouped with *Carex comosa* and *crinita* presents a miniature picture of rural beauty hardly to be excelled, and needs only to be seen, never more to be forgotten.

A. VERRON.

FISH LAWS AND POLITICS.—The action of the New Hampshire Fish Commissioners in closing the waters of Lake Winnepesaukee for sixty days has given rise to some amusing crimination among the papers of that State. One organ calls upon the people to rise against the law which is an outrageous imposition of the Republican party. To this the Manchester *Mirror* replies that the law was drafted by a Democrat, and passed by unanimous vote of both parties. Meanwhile the fish are growing fat, and rather hope for another "party outrage" of the same sort.

# SALMON IN PENNSYLVANIA RIVERS.

We hasten to offer our congratulations to the Fish Commissioners and people of Pennsylvania, the first for their crowning success, and the second for their great acquisition. The story of the first Pennsylvania salmon, which we recorded last week, is fully told in the following article from the *Easton Express* of November 23:

**SALMO SALAR.—THE FISH CAUGHT IN THE BUSHKILL YESTERDAY—ITS SCIENTIFIC IMPORTANCE—ARTIFICIAL STOCKING OF STREAMS NO LONGER AN EXPERIMENT.**—The killing of the large fish in the Bushkill, a full account of which appeared in the *Express* of yesterday, is of the greatest scientific significance, because it gives the assurance of success to the stocking of the streams of this and other States, an experiment which has been attracting the attention of modern pisciculturists and because it demonstrates the practicability of rendering the salmon—the king of all game fishes—a *habitat* of the waters of our latitude. The Bushkill has been made the depository of a large number of salmon for some years past. The first lot of fish introduced into this stream was placed there about eight years ago by private enterprise. They were the *salmo salar*, or the salmon of the North. The first attempt in the same direction made by the State Fish Commissioners was in 1873. These also were the *salmo salar*.

Since 1873 there have been large numbers of either the *salmo salar* or the *salmo gairdneri* (California salmon), planted each year in the Bushkill. The *salmo salar* never having been heard of since their introduction, and as they require water of a very low temperature, and as it is extremely problematical whether they have ever inhabited our waters, the failure of the attempt to stock our waters had come to be regarded as a failure.

The capture of this fish, however, has crowned their labors with all the success that had ever been hoped for, and will stimulate the Fish Commissioners of this and neighboring States to renewed efforts. Their zeal has been untiring and their reward most satisfactory.

The salmon was last evening carefully examined by a number of gentlemen who take great interest in the scientific classification of fish, and was unanimously pronounced by them a female *salmo salar*, probably of the hatching of 1873.

The fine fish the *Easton Free Press* says was taken in Groetzinger's mill race on the Bushkill, at the foot of Fourth street. It was on exhibition at the office of that journal, preserved in a refrigerator, and was finally sent to the Smithsonian Institution for preservation. One thing remarkable to be borne in mind is that the Hudson River has hitherto been the southern limit of the range of *Salmo salar*, and it is not fully authenticated that it has ever populated the Hudson.

The fish may be described as follows: Weight, 9 pounds; length of head, 6½ inches; total length, 33 inches; Caudal, when expanded, 9 inches; girth in front of Dorsal fin, 15 in. ches.

Shape, ellipse considerably elongated, the greatest depth being in front of Dorsal fin.

Shape of Caudal almost straight, being very slightly lunate. Color.—Back greenish-blue, marked above the lateral line by irregular X shaped dark spots, from an inch to inch and a half apart. There are also two or three marks on the opercle. Sides, silver gray; belly, white.

Teeth.—Incurved. Upon the maxillaries, intermaxillaries, palatines, and tongue, with two or three more upon the vomer; bronchial rays, 12 in number.

Number of fin rays: Pectoral, 13 inches; ventral, 9 inches; anal, 9 inches; dorsal, 12 inches; caudal, 18 inches, exclusive of rudimentary rays; second dorsal, adipose, this being an unmistakable characteristic of the *salmonidae* family; gill covers with rounded edges; scales small.

The fish, which was apparently ripe for spawning, contained a large quantity of eggs, deep orange in color, and a little over two lines or one-fifth of inch in diameter.

The color of the fins was quite dark, showing that the fish had been for a considerable time in fresh water. This view is corroborated by the emaciated condition of the salmon and the deep color of its back.

It is reasonably certain from all the indications that the fish left the sea in June or July, at which time she weighed not less than thirteen pounds, and was with her male companion in the act of preparing bed when discovered and captured.

While the entire community may be congratulated upon the taking of this fish, because of its scientific testimony, and the encouragement it gives to a good work, it is at the same time proper that attention should be called to the law which prohibits the taking of salmon between August 15, and April 1, and imposes a penalty of \$10 upon all violations of the same.

**AMERICAN OVA WANTED IN EXCHANGE FOR PRUSSIAN.**—We are much pleased to further the very commendable object set forth in the following letter from Mr. Mather, who is now in Prussia:

EDITOR FOREST AND STREAM. BERLIN, Nov. 7, 1877.  
Mr. Carl Schuster, of Friburg, wishes to exchange ova with American fish culturists, and has to offer those of the common trout of Europe (*salmo faro*), the salmon (Rhine), *S. salar*, the whitefish of Lake Constance (*coregonus fera*) and the "charr" or sabling (*salmo salvelinus*).

The latter fish is well known in England as "charr," and is somewhat like our own brook trout, but higher colored; in fact, it is the English standard of redness, as they often say, "as red as a charr."

Prof. Peters calls it the finest salmon for the table in Europe, and some of our fish culturists will do well to ship Mr. Schuster some trout eggs, which he wishes, and get this fine fish in return. He is an honorable gentleman and an enthusiastic fish culturist, who has done much for German fish culture.

I have seen his place, and consider it very perfect. He has had many of the "Holton" boxes made to hatch the *coregonus* of Lake Constance this winter. Address packages or letter to Oberburgmeister, Carl Schuster, Friburg, Bregau.

I think that the Americans need only to see the charr to appreciate it.

I have mislaid Mr. Schuster's price list, but will find it on unpacking and will publish it.

FRED MATHER.

—In our answer to Dr. E. S., Cleveland, as to first description of Michigan grayling, we should have said Joel C. Parker, (not John) Dentist, Grand Rapids, Mich. It was not a published description, but an identification sent to Prof. Theo. Gill.

## Natural History.

### GEOLOGICAL STUDIES IN THE TERRITORIES.

WE are in receipt of the following most interesting data, which have been furnished us by Mr. J. V. Hayden in advance of his coming publication:

Prof. Joseph Leidy, the eminent comparative anatomist and microscopist, made his second visit to the West the past season under the auspices of the survey. He made a careful exploration of the country about Fort Bridger, Vintash Mountains and the Salt Lake basin in search of rhizopods. He has been engaged for a long time on a memoir on this subject which will eventually form one of the series of the quartos of the Survey.

The rhizopods are the lowest and simplest forms of animals, mostly minute, and requiring high power of the microscope to distinguish their structure. While most of them construct shells of great beauty and variety, their soft part consists of a jelly-like substance. This the animal has the power of extending in threads or finger-like processes, which are used as organs of commotion and prehension, often branching. From the appearance of their temporary organs, resembling roots, the class of animals has received its name of rhizopod, meaning literally root-footed. In compensation of the smallness of these creatures, they make up in numbers, and it is questionable whether any other class of animals exceed them in importance in the economy of nature. Geological evidence shows that they were the starting point of animal life in time, and their agency in rock-making has not been exceeded by later, higher and more visible forms. With the marine kind, known as foraminifera, we have been long-t familiar. The beautiful, many-chambered shells of these—for the most part just visible to the naked eye—form a large portion of the ocean mud and the sands of the ocean shore. Shell of foraminifera likewise form the basis of miles of strata of limestone, such as the chalk of England and the limestones of which Paris and the pyramids of Egypt are built. Fresh water rhizopods, though not so abundant as marine forms, are nevertheless very numerous. They mainly inhabit our lakes, ponds and standing waters, but they also swarm in sphagnum swamps, and ever live in newest earth. Professor Leidy has devoted several years of study to the fresh water rhizopods of the Eastern portion of our country, and his especial object in the past expedition was to investigate those which are to be found in the elevated regions of the Rocky Mountains.

The botany of the Survey was represented the past season by the two great masters of that department, Sir Joseph D. Hooker, Director of the Gardens of Kew, England, and President of the Royal Society of London, and Prof. Asa Gray, of Cambridge, Mass. Their examinations extended over a great portion of Colorado, Wyoming, Utah, Nevada and California. Their investigation into the alpine floras and tree vegetation of the Rocky Mountains and Sierra Nevada enabled them to give a clear idea of the relations and influence of the climatic conditions on both sides of the great mountain ranges. Sir Joseph Hooker, whose botanical researches embrace the greater part of Europe; the Indies, from the Bay of Bengal across the Himalayas to Tibet; the Antarctic regions and the southern part of South America; New Zealand, Australia, South Africa, Morocco and Asia Minor, presents in the English periodical, *Nature*, for October 25, an outline of his studies during the season, and this outline when filled out will form a most important report for the Eleventh Annual report of the Survey. It will be seen at a glance that the report will be of the most comprehensive character and cannot fail to be of the highest interest to our people. The tree vegetation, and especially the conifers, were made especial objects of study, and many obscure points were cleared up.

Of a section of the Rocky Mountains comprising Colorado, Wyoming and Utah, Dr. Hooker says: "Such a section of the Rocky Mountains must hence contain representatives of three very distinct American floras, each characteristic of immense areas of the continent. There are two temperate and two cold or mountain floras, viz.: (1) a prairie flora derived from the eastward; (2) a so-called desert and saline flora derived from the west; (3) a sub-alpine; and (4) an alpine flora; the two latter of widely different origin, and in one sense proper to the Rocky Mountain ranges."

The principal American regions with which the comparison will have first to be instituted are four. Two of these are in a broad sense humid; one, that of the Atlantic Coast and which extends thence west to the Mississippi River, including the forested shores of that river's western affluents; the other that of the Pacific side from the Sierra Nevada to the western ocean, and two inland, that of the northern part of the continent extending to the Polar regions and that of the southern part extending through New Mexico to the Cordillera of Mexico proper.

The first and second (Atlantic plus Mississippi and the Pacific) regions are traversed by meridional chains of mountains approximately parallel to the Rocky Mountains; namely, on the Atlantic side by the various systems often included under the general term Appalachian, which extend from Maine to Georgia; and on the Pacific side by the Sierra Nevada, which bounds California on the east. The third and fourth of the regions present a continuation of the Rocky Mountains of Colorado and Utah, flanked by a certain distance by an eastern prairie flora extending from the British possessions to Texas, and a western desert or saline flora, extending from the snake river to Arizona and Mexico. Thus the Colorado and Utah floras might be expected to contain representatives of all the various vegetations of North America except the small tropical region of Florida, which is confined to the extreme southeast of the continent.

The most singular botanical feature of North America is unquestionably the marked contrast between its two humid floras, namely, those of the Atlantic plus Mississippi, and the Pacific one. This has been ably illustrated and discussed by Dr. Gray in various communications to the American Academy of Sciences and elsewhere, and he has further largely traced the peculiarities of each to their source, thus laying the foundations for all future researches into the botanical geography of North America; but the relations of the dry intermediate regions, either to these or to the floras of other countries, had not been similarly treated, and this, we hope, we have now materials for discussing.

Dr. Hooker sums up the results of the joint investigations of Dr. Gray and himself—aided by Dr. Gray's previously intimate knowledge of the elements of the American flora—from the Mississippi to the Pacific Coast, "that the vegetation of

the middle latitudes of the continent resolves itself into three principal meridional floras, incomparably more diverse than those presented by any similar meridians in the old world, being, in fact, as far as the trees, shrubs, and many genera of herbaceous plants are concerned, absolutely distinct. These are the two humid and the dry intermediate regions above indicated.

"Each of these, again, is sub-divisible into three, as follows: "1. The Atlantic slope, plus Mississippi region, sub divisible into (a) an Atlantic, (B) a Mississippi Valley, and (V) an interposed mountain region, with a temperate and sub-alpine flora.

"2. The Pacific Slope, sub-divisible into (a) a very humid, cool, forest-clad coast range, (B) the great, hot, drier California Valley, formed by the San Juan River flowing to the north and the Sacramento River flowing to the south, both into the Bay of San Francisco, and (V) the Sierra Nevada flora, temperate, sub-alpine and alpine.

"3. The Rocky Mountain region (in its widest sense extending from the Mississippi, beyond its forest region, to the Sierra Nevada), sub-divisible into (a) a prairie flora, (B) a desert or saline flora, (V) a Rocky Mountain proper flora, temperate, sub-alpine and alpine.

"As above stated, the difference between the floras of the first and second of these regions is specifically, and, to a great extent, generically absolute; not a pine or oak, maple, elm, plane or birch of Eastern America extends to Western, and genera of thirty to fifty species are confined to each. The Rocky Mountain region, again, though abundantly distinct from both, has a few elements of the eastern region, and still more of the western.

"Many interesting facts connected with the origin and distribution of American plants, and the introduction of various types into the three regions, presented themselves to our observation or our minds during our wanderings. Many of these are suggestive of comparative study with the admirable results of Heer's and Lesqueren's investigations into the phloene and miocene plants of the north temperate and frigid zones, and which had already engaged Dr. Gray's attention, as may be found in his various publications. No less interesting are the traces of the influence of a glacial and a warmer period in directing the course of migration of Arctic forms southward, and Mexican forms northward in the continent, and of the effects of the great body of water that occupied the whole saline region during (as it would appear) a glacial period.

"Lastly, curious information was obtained respecting the ages of not only the big trees of California, but of equally aged pines and junipers, which are proofs of that duration of existing conditions of climate for which evidence has hitherto been sought rather among fossil than among living organisms."

Messrs. S. H. Scudder, of Cambridge, and F. C. Bowditch, of Boston, spent two months in Colorado, Wyoming and Utah, in explorations for fossil insects, and in collecting recent Coleoptera and Orthoptera, especially in the higher regions. They made large collections of recent insects at different points along the railways from Pueblo to Cheyenne, and from Cheyenne to Salt Lake, as well as at Lakin, Kans.; Garland and Georgetown, Colorado, and in various parts of the South Park and surrounding regions. For want of time they were obliged to forego an anticipated trip to White River to explore the beds of fossil insects known to exist there. Ten days were spent at Green River and vicinity in examining the tertiary strata for fossil insects, with but poor results. Ten tertiary beds of the South Park yielded but a single determinable insect, but near Florissant, the tertiary basin, described by Mr. Peale in one of the annual reports of the survey, was found to be exceedingly rich in insects and plants. In company with Rev. Mr. Lakes, of Golden, Mr. Scudder spent several days in a careful survey of this basin, and estimates the insect bearing shales to have an extent at least fifty times as great as those of the famous locality at Eningen, in southern Bavaria. From six to seven thousand insects, and two or three thousand plants, have already been received from Florissant, and as many more will be received before the close of the year. Mr. Scudder was also able to make arrangements in person with parties who have found a new and very interesting locality of tertiary strata in Wyoming, to send him all the specimens they work out, and he confidently anticipates receiving several thousand insects from them in the course of the coming winter. The specimens from this locality are remarkable for their beauty. There is, therefore, every reason to believe that the tertiary strata of the Rocky Mountain region are richer in remains of fossil insects than any other country in the world, and that within a few months the material at hand for the elaboration of the work on fossil insects, which Mr. Scudder has in preparation for the Survey, will be much larger than was ever before subject to the investigation of a single naturalist.

### GROWTH OF TROUT.

OAKLAND, BERGEN CO., N. J., Nov. 11.

*Friend Hallock*—Having been interested very much in the experience of several parties which has appeared in the columns of the *FOREST AND STREAM* in regard to the growth of trout, I beg leave to offer a few lines of what I know about trout raising.

There is a great difference in the growth of trout in different streams, owing, no doubt, to the kind and quality of food as well as quantity. All fish culturists are aware that trout of the same age bred in same waters from the same parents are not all of the same size, even at six weeks old or one month after they begin to feed, although their chances were equal in every respect. I begin to sort my trout when they have been feeding for a month, and I always have three sizes I raise as small fish as any one, and I think as large as any one. Last year I sold a lot of two thousand at nine months old that would measure from four to six inches in length, every one of them. I had another lot of trout that were hatched at the same time from the same lot of eggs that were fine, vigorous little fellows not more than an inch and a half long—fed the same, had the same chance in every respect. Out of the same lot of eggs I had another pond of fish that were about two and a half or three inches long. My facilities were perhaps better for experimenting than some of your correspondents', they being all right as far as their experience went. Now, I wish to claim your attention a little further, and explain another experiment.

Two years ago I placed, within a week's time, several pairs of trout in a small spring pond, and let them spawn themselves. As soon as they were done spawning, I took them out; I put pairs enough in until I thought there would be fish enough for the pond and two other smaller ponds below with a fall between them of eighteen inches or more without any screens between them; but at the last pond I placed a screen

as secure as possible, so that the smallest fish could not escape. In due time my fish hatched out splendidly, and I had a fine lot of them. I covered the pond with boards partially, and took the best of care of them. In about a month after they began to feed I discovered quite a number in the second pond. In the lower or third pond I saw none for nearly two months and a half. In about three or four months my fish were about equally divided in the three ponds, and sorted better than I could have done it by hand. All the little dwarfs were in upper pond, those larger in size were in the second pond, and in the third pond were the largest and finest fish of the lot. The ponds were nearly the same size, though the third one was perhaps the smallest. I kept them in these ponds for six months. Those in third pond measured about three inches long; in the second, two and a half inches, and in the first there was not a fish above an inch and a half long. The same experiment was tried the past year with the same result. It is a well-known fact that young trout will get through the smallest possible hole, therefore have not some of your correspondents lost their largest trout, and preserved their small ones every year, and consequently think that trout won't grow for them only two and a half to three and a half inches long. I also claim that trout grow faster for the first year and a half than they ever do afterward. From a nondescript of one-half an inch long he becomes a trout of six inches in one year—after that, does he double his size as many times in a year? In the fall of '73 I had three trout from Rangeley Lake, in Maine, placed in my ponds—two males and one female. The males weighed a little over three pounds a piece, the female less. The female died in about six or eight months. When she spawned, I got thirteen hundred eggs from her. One of the males died in about one year with what Mr. Stone calls black ophthalmia, and although he was very thin and all head when he died he weighed 35 lbs. The remaining one I kept for over two years and a half, and he must have weighed nearly six pounds, according to his length and breadth. He was always in perfect health, and became a great pet, allowing me to rub his belly with my hand with seeming delight. He was stolen from my pond one night by some miserable thief. Hoping to hear from some other parties on the growth of trout through your columns, I will close by saying that almost every year I have raised trout that measured seven inches and a half in length at one year of age as well as an inch and a half of the same age. B. B. PORTER.

## ICHTHYOLOGICAL EXTRACTS FROM THE NOTE-BOOK OF A NATURALIST.

BY J. CARSON BREVOORT.

[We take great pleasure in being permitted, through the kindness of Mr. Brevoort, to lay before our readers some extracts from that gentleman's memoranda, which extend over a number of years. The notices of the occurrence of fish and other natural phenomena in the vicinity of New York, in earlier years, are of great interest, inasmuch as they indicate the peculiarities of the period covered by the extracts, and the changes which have taken place since then.—Ed.]

March 26, 1844.—Salmon just in market from the Kennebec, 6s. per pound.

Bathampton, L. I., August 12, 1844.—Seine drawn. First haul—7,000 small, mostly with single spot, a few with many spots, and a half-dozen with large ones; about 12 skip-jacks or Eel herring; half-dozen harvest fish (4 to 7 inches long); and spotted crabs. Second haul—Dogfish (*Mustela canis*); flatfish (oblong flounder); blue fish (*Uremia*); few menhaden. Third haul—19,000 fish, all menhaden; fish all of a size; very small and almost all spotted a few about 5 oz., single spot and 4 or 6 large ones; large ones all single spot; one young blue fish 4 inches long.

September 30, 1844.—Wind from W. S. still strong; shores of pond covered with *Lichia Carolina* from 1½ to 5 inches long, killed by cold, said to be a rare fish in DeKay; could have got 200.

New York, March 12, 1847.—A shad was taken to-day at Rockland, the first of the season; bought by Corporation for \$5.00—Hudson River not yet free from ice.

September 20, 1848.—Weak fish run in shoals, they bite for a few minutes freely and then are gone, driven away by the blue fish of one-half their size, which are taken immediately after; they bite at a particular time of the ebb; ours averaged three-quarters of a pound apiece; I believe them to be called weakfish from *wecke*, German, and *wecke*, Dutch, meaning soft, from their dying rapidly and becoming soft, instead of hard like other fish, and keeping but a short time. The black fish are small, though a few weigh about a pound each; they are of the brown barred variety. The black bass very small, but are beautifully colored. About the first of September a *Pristigaster*, or sawfish, was caught at New Utrecht; it was about 6 or 8 feet long, with a saw some 3 feet long. Fishermen had never seen it before.

October 9, 1848.—In market: bass, blackfish (plenty and large), haddock, cod, tom-cod, one ling, flounders, turbot, all halibut, white perch, ruddy bass, yellow perch, sunfish, chub or suckers, pickerel, one 13 inches long, with a dace 8 inches in belly, striped mullets, black bass, smelts, bluefish, weakfish, fall herring, *Alosa Motencana*, etc. Porgies of all kinds, some very large; no more sheepshead.

October 14, 1848.—Pickerel now and then of 3 pounds and over; some much distended by fish in bellies. *Pogonias fusiatus*, banded drum, fall mackerel, some from Boston. Shad sometimes run in schools and carry away or destroy a net; can be seen swimming with great rapidity.

October 21, 1848.—The *Centropomus nigricans*, or black bass, plenty still, and all of nearly black color; they are lighter earlier in the season. *Rhombus triacanthus*, called broad shiners, are plenty and of large size. Ling are now found occasionally in the fyke nets, with frofish, etc. Smelts are very plenty about Boston.

September 16, 1849.—Lafayette porgies or *Leiostomus obliquus* plenty. *Leiostomus xanthurus*, two in market.

September 19, 1849.—18 *Cybitum maculatum*, averaging 20 inches apiece. Strings of small mullet. Every few days we find a few of the southern Lafayette, *Leiostomus xanthurus*, mixed with the common kind.

October 4, 1849.—Black bass run larger, say 3 or 4 pounds; no smelts; few sheepshead yet; weakfish pretty large; no kingfish for a week; large bass coming; small muddy bass. *Merlangius carbonarius*, cod, haddock, no tom-cod; large blue fish; blackfish getting plenty. Blackfish certainly are banded, saw hundreds in a box alive, all appeared banded. Blackfish very very much in the hues of the body, but the dark shade,

always the same; a dusky brown on a ground of the same lighter, or reddish brown, light orange brown, gray, white and purplish.

October 5, 1849.—Squids, plenty in market; large blue bass; porgies averaging 16 inches; Lafayette and white corneas, among which I found three specimens of a new species of *Vomer*; 2 small yellow *Caranx*, mixed up with *Rhombus triacanthus*. Fall mackerel from Boston; large blue fish; some large and small king fish.

October 24, 1849.—A few king fish; some small drum, 6 or 8; large bass of 35 pounds; weak fish; large blue fish, pickerel, perch, sunfish, Lafayette, tom cod, and *Physa americana*, large *Caranx*, squids.

October 31, 1849.—A black fish, 25 inches, 8 pounds; head of an albicore (Tunny?) caught in a small creek on south side of Long Island and brought to New York, weighing about 60 pounds.

We learn that the cold has been so severe in Massachusetts that in some of the ponds the fish have been frozen by thousands, and taken in that condition; 60,000 pounds of bass from Pecon pond, and 120,000 pounds from Newtown pond are said to have been sent to this market.

Forty tons of striped bass were taken at one haul in Tisbury, on Saturday last, and on Sunday eighty tons of the "same sort" of delightful fish were taken at Edgartown.—*New York Herald*, Jan. 1, 1849.

Smelts taken in the Passaic, made their first appearance this week.—*Courier and Enquirer*, March 10, 1849.

The first shad caught this season was taken on Wednesday at the Narrows, by Allen Sheffield, and sold for \$5.—*Courier and Enquirer*, March 10, 1849.

April 8, 1851.—Bass scarce. Plenty small blackfish. Halibut been in market some time. Fish have been very scarce this winter.

April 19, 1851.—Caught 18 pounds of small blackfish, blue bass, and porgies, etc. No weakfish in Jamaica bay yet, at least not many. No bergalls; bluefish plenty, dogfish, toadfish; no snipe nor ducks. Mr. Forbell says that sheepshead began to be plenty three years ago. Heard from J. J. Baker of 200 sheepshead at one haul in South Bay ten days ago—all from 9 to 12 pounds.

Rockaway, August 26, 1851.—Porpoises only approach land when wind is off shore, showing that they swim against the wind, which brings them in case of a land breeze near the land. They fear being cast ashore. One was speared yesterday at Calvin Mott's landing. They often enter the bay.

October 28, 1851.—Snapping mackerel (*Scomber grex*) abundant. Striped bass, from 20 to 40 pounds, common. Many "Southern trout" in market, from South, said to keep better than weakfish. Saw a sheepshead in market.

January 30, 1852.—Eels acquire a very disagreeable hydro-sulphuretted taste when taken from Denton's pond, owing to factories.

May 14, 1853.—First bluefish, very meagre; kingfish; a few tom cod still in market; large pike perch from lakes, etc. Salmon 6 shillings, trout 5 shillings a pound; sand snipe.

April 18, 1854.—Few smelt in market; shad not plenty.

April 23, 1854.—Lamprey eels in market.

May 6, 1854.—Quantities of porgies caught in shad nets, supposed to have been lost in the muddy water. Shad scarce, the heavy rains and muddy water probably keep them out of the river.

May 11, 1854.—Blackfish in market; mackerel, weakfish, sea bass, coming in; large drumfish.

May 13, 1854.—Salmon \$1 per pound; large bass and a few large sea bass in market. Many large porgies.

May 19, 1854.—Kingfish from Shrewsbury in market. First bluefish in market.

June 5, 1854.—Sheepshead in market.

June 6, 1854.—Sheepshead coming in—said to be plenty in Jamaica Bay.

Rockaway, August 7, 1854.—Cool north wind; boats on beach hauling nets and caught a few large bluefish of 10 to 13 pounds; none near beach. Thread herring, sting rays, sharks, etc. Found *Lichia* in sea or beach. (Small mullet?) washed up.)

June 24, 1854.—Fine, clear, breezy. Caught a few weakfish at mouth Spring Creek, Jamaica Bay.

August 22, 1854.—Mr. S. caught a sheepshead with soft crab. *Monocanthus aurantiacus*, 24 inches long, hooked accidentally, brilliant, brassy, orange with black blotches about occiput and ant. part of back; a balance on dorsal fin. Eye with dark iris when alive and very moveable. Its jaws cut grass like a pair of scissors.

September 25, 1854.—On Saturday received 2 *Monocanthus*, 3 *Saururus fatens*, caught in Jamaica Bay.

September 26, 1854.—Pleasant, warm, wind S. *Alosa matencana* in market; got *Seriola*, large specimen; some dozens in market. *Pelamys sarda*, small ones, in numbers; one *Balistes*, one very small *Caranx*, all from Shrewsbury Inlet and Bay. Large bluefish plenty. *Merlangius carbonarius*.

September 28, 1854.—Found *Cybitum maculatum* in market. Sheepshead, *Sargus* ous, fat. Large bluefish and blackfish.

October 18, 1854.—Fresh, clear, cool. Small fall mackerel plenty, very fat, large eyes, back covered with crowded, irregular, wavy lines—in a few specimens more regular. Many *Rhombus triacanthus*, some covered with pale spots; large bluefish, striped bass, few weakfish, blackfish, many mullet, halibut, cod, yellow perch, sunfish, lake bass, pickerel.

November 1, 1854.—There has been an oyster panic, now subsiding, owing to three or four well-known persons (Alderman White and James C. Foster) having died suddenly, their death being said to have been caused by eating oysters, but on inquiry they were found to have been sick some time before. It was said the Virginia oysters alone were to blame. The papers were full of it.

(To be Continued.)

## ANOTHER SUPPOSED HYBRID.

NEW WESTMINSTER, British Columbia, Oct. 17, 1877.

EDITOR FOREST AND STREAM:

I read lately a very able article in your paper on Hybrids, by Professor Gill, and while not attempting to question the correctness of the opinion of so high an authority on such matters, I wish to mention that many well authenticated statements are made in this country of hybrids between the male marten and the female domestic cat. Such a cross would be more likely to occur here, if anywhere, than in other places, from the fact that many persons engaged in mining, cattle raising, etc., live in isolated situations, miles frequently from their nearest neighbor, and in almost all cases to protect themselves from the ravages of the brush-tailed rat and field mouse, keep a cat. These cats in thickly settled countries would have access to males of their own kind, and the necessity of crossing with an animal of any other kind would not exist. Indeed they would have little or no opportunity of so doing, were they

so inclined, on account of the scarcity of wild animals in their vicinity while the opposite is the case in sparsely settled places.

Now the alleged cases of crossing all occurred in remote places, where the cat was a female, and from the great distance from other settlers could have no intercourse with a male of her own kind. The progeny were raised, and partook of the characteristics of both parents in appearance and habits, and were better ratlers and mouseers as a rule than either cats or martens; the latter being known to be a great killer of rats and mice.

I have not had the opportunity of seeing any of these animals myself, and unfortunately not being up in scientific knowledge, had I seen them might not have been able to specify their characteristics in such terms as would enable a naturalist to decide upon them. I know, and have conversed with dozens of persons who have seen them, and they have no hesitation in pronouncing them really to be a cross between marten and cat. Of this I am positive, that cats at four different places, several hundred miles apart, not having a male cat within many miles, produced litters of young which partook so strongly of the look of both cat and marten, that all who saw them were confident that they were hybrids as above stated. Now, should Prof. Gill or any other person have a desire to learn more about these strange animals I will have much pleasure in furnishing the names of the persons who owned them, and of any amount of persons who saw them, many of whom still reside here. The matter is of no moment to me one way or the other, but if it is of any importance in the interests of natural history to learn positively in relation to such a cross, I will be very glad to lend what assistance I can, by endeavoring to obtain such information as would enable competent authority to judge and determine whether the opinion in reference to the cross is a correct and proper one or not.

Yours truly,

MOWITCH.

[We have written to our correspondent asking him if possible to obtain one of these supposed hybrids, and to forward its skin and skeleton to Prof. Gill, at the Smithsonian Institution. If this can be done we shall at least learn what it is, and the matter can be set at rest as it was in the case of the animal referred to in Prof. Gill's article on the so-called hybrid between the cat and the raccoon. This last proved to be merely a large Angora cat. We hope that our correspondent will let us hear from him again on this topic.—Ed.]

## BREEDING OF WILSON SNIPE.

MEADVILLE, Pa., Nov. 17, 1877.

EDITOR FOREST AND STREAM:

Dear Sir—Breeding of the Wilson snipe, in your last issue, calls upon me to note that Mr. Lorandi and I were hunting snipe near this city on the 18th day of May, 1876. My dog came to a point. I flushed and shot the bird—a Wilson's snipe. It was the first bird of the dog ever retrieved, and when it was in my pocket I sent the dog into the same snail, where he came to a point at about the same place. I thought there was to be good sport that day, and walked up to flush another bird, when, to my surprise, I found a nest on a tuft of grass with four warm eggs in it. We returned to the nest twice, and both times found the eggs cold, so at 4 p. m. I took nest and eggs home with me. We compared the eggs with the plates in "Samuels," and found them identically the same with the representation there of a Wilson's snipe egg. I now have nest and eggs labelled, "Taken on the marsh, May 13, 1876, just one year later than the nest taken in Portland, Connecticut."

Yours truly,

EDGAR HUIDEKOPER.

## THE TAME SQUIRRELS OF MEMPHIS.

MEMPHIS, Tenn., Nov. 12, 1877.

EDITOR FOREST AND STREAM:

In winging my way to the orange groves of Florida, I decided to strike the Mississippi at Memphis, and then float down to New Orleans on one of the palace steamers which pass here from St. Louis.

While awaiting the "Vicksburg," your correspondent is well cared for at the Peabody Hotel, which is under the able management of C. B. Galloway. His "Hunter," over in the "Arkansas Bottoms," furnishes fresh game, which the accomplished steward, Melville, prepares in good style, so that we have quail, prairie chicken, duck, bear and venison, which all taste gamey.

To-day I sought out and introduced myself to one of your admirers—Major Nicholson—the agent for "Dunn's Horncite Reporter." He is a crack shot, and a perfect Nimrod. He entertained me a few moments, telling of turkey, bear and deer.

But I set out to tell you of the park here, and the squirrels occupying it. About twenty-five years ago Mayor Richard H. Baugh and Alderman J. P. Finney, with other citizens, donated a square of ten acres for park purposes, right in the heart of the city. It had a few oaks and other trees; maple, sycamore, elm and mulberry, with many magnolias, have been set out.

Mr. Keeting, the forester, is paid \$75 per month to keep things in shape. A fine fountain in the centre continually spouts forth water.

When my wife and I started through the park we were soon beset with squirrels (gray). They came scampering from all directions, leaped upon us, expecting some nuts. When we reached the fountain we seated ourselves to watch these "bunnies." Many little children and grown persons were there feeding these nimble fellows. They will climb upon one's knee or shoulder, and sit there eating nuts as unconcerned as a pet monkey. When fully satisfied they will bury their surplus nuts, so that you see them constantly hiding and digging up their food. Some of them took a position *a la kangaroo*—bolt upright—with the tail lining their backs, then would settle their arms down upon their little bellies, and seemed so comfortable. In this position they would sit for more than a minute, with eyes half closed, and panting or breathing heavily, then would suddenly bound away as though stricken with a severe attack of colic!

I learned from Mr. Keeting that squirrels have been in the park for over twenty years. The City Council appropriates \$5 per month for their maintenance, and makes it an offence to permit a dog within the inclosure.

Mr. Keeting says that they number about one hundred, and though they breed twice a year—in March and August—yet so many of them stray away along the shade trees, that a great number are killed by dogs and caught by boys when the "bunnies" get too far from the park. Mr. K. says early in the morning they often go two squares away and steal nuts and fruit from the Italian stands. His regular time for feeding them is at 8 o'clock in the morning, when he calls them by ringing an ordinary hand bell. This morning my wife and I witnessed this amusing breakfast. At the first sound of the bell "bunnie" bounced up a root or tree, and gave a chuckle, signifying his joy with several jerks of his tail, then he came skimming and tripping delicately to the little house. Mr. K. says they prefer alberts, and these he threw out to them as if throwing shelled corn to chickens. He says they never breed black or white; and although these off colors have been introduced here, yet they have no progeny of their color. He thinks the gray squirrels live to be some seven years of age. They sometimes drop down dead from the topmost limbs. They injure the buds of most of the trees, and play destruction with the magnolia blossoms. They

catch and kill all the birds so unfortunate as to get in their way. The young of March breed in August. They have from one to four in a litter. The "babies" come to the ground when two months old. They practice a great deal on the limbs and bodies of the tree are they venture to the ground.

The old ones often engage in fierce combat, and tumble from the trees locked in each other's arms. One of them attacked a stranger, who began digging up a nut just buried by "hunnio." But they have never been known to bite any one while feeding them.

It is a great source of amusement here for the children to visit the park and feed these public pets. Would it not be well for other cities to follow the example of Memphis. The boxes for the squirrels cost no more than the houses built for sparrows. ARROW.

For Forest and Stream and Rod and Gun.

## A VISIT TO A NESTING PLACE OF THE WOOD IBIS.—*Tautalus leucolator*.

DURING the winter of 1874, while on a collecting tour in Florida, I encamped on the east side of Lake Harney in company with two hunters. I had taught these men to make respectable skins, and had interested them in a slight degree in Natural History. Together we had made several collecting trips in the vicinity of Lake Harney, at one time shooting and skinning 140 herons, of several varieties, on Lake Jessup in four days. I was just preparing to depart for the North, when I heard of a large nesting place of "gannets," as the "crackers" called birds which subsequently proved to be Wood Ibises (*Tautalus leucolator*). The nesting place was reported to be on the shores of a lake of considerable size about midway between Lake Harney and the Indian River.

After many inquiries, I decided to attempt to find this breeding place. We placed our boat on an ox cart, and having packed all camping utensils inside, we started off. After a tedious journey over the roughest of Florida roads, we reached Lake Ashby, and pitched our tent. Dismissing our team with instructions to call for us in a week, and having partaken of a hasty repast, we started off in our boat. We hunted all the afternoon on the shores of the lake, and although we found many nests of the snake bird (*Pistes cubinga*), yet we not only saw no nests of the wood ibis, but no birds. Early next morning saw us in our boat, ready for a hard day's pull; but as soon as we left camp I saw, on the opposite shore of the lake, large numbers of white birds. Rowing there our eyes were gladdened by the sight of numbers of large nests, perched in the tops of lofty cypress trees. Numbers of wood ibis flew from the nests at our approach.

These trees were not on *terra firma*, but were about forty yards distant in the water. Drawing our boat in the swamp, we separated, two of us to shoot, and the other to stay in the boat and retrieve birds. The birds soon came back to their roosts, and we shot all the morning killing 26. The birds, although very large, are, in common with the heron tribe (*Ardeidae*), very easy to kill. During the day we lost four birds by the "gators" picking them up before the boatman could get to them. I never saw "gators" so cheeky; we struck one twice on the head with an oar, and he still kept on after the bird. I finished him with a load of buckshot, and found him 8 feet, 7 inches long. In three days we collected all the wood ibis' skins and eggs we wished. Most of the eggs were hatched, and the downy little birds, with such huge bills and unshapely heads, presented a funny sight.

Having four days to spare, we started through a cypress swamp after a white heron (*Ardea egretta*) roost. I saw, in this day, more mossassin snakes than I ever saw before, or will probably see again. Every tussock of grass concealed one, and, as we were obliged to jump from one firm spot to another, we stood in great danger. I was walking, or rather jumping, behind one of the men, when a large mossassin sprang for him, and actually tore a triangular rent in his trousers, where they overhung his boots. I shot the snake's head off from between the man's legs, and on measuring him, I found he was 78 inches long, his fangs being  $\frac{1}{2}$  of an inch in length. I have seen thousands of mossassin snakes in this State, but I confess this is the largest. I felt nervous the rest of the day. We shot a fine fat doe on this trip, and had to lug her saddle six miles—no easy job through a swamp.

On reaching camp I had a violent chill and fever, and before I got back to Lake Harney, I had four chills; and that, combined with the ride of twelve miles over a road crossed and recrossed by palmetto roots, so laid me up that I was very ill, and did not enter New York Harbor till May 1. This short trip is the roughest and most disagreeable I have ever made in pursuit of bird skins, but when it was all over and I was in my home, I considered myself well repaid.

The wood ibis (*Tautalus leucolator*) is, generally, a very sly bird, and but few are collected. They feed on aquatic plants, and, when young, are very fair eating. I also collected some fine skins of the white ibis (*Ibis alba*). I forgot to mention that Lake Ashby abounds in fine black bass, which take a spoon readily, but refuse a fly.

If any of your readers wish to visit this unhealthy locality in pursuit of the wood ibis, I will give him or them all needed directions for finding the place, also the names of guides. Deer and turkeys are very numerous. We heard the latter gobbling every morning in the swamps, but the place is a hot-bed of malaria, and seems to be the home of mossassin and rattlesnakes. WM. K. LENTZ.

Lentz's Landing, Lake George, Florida.

[We have to thank our correspondent for the above extremely interesting account. If we mistake not, the breeding place which he visited is the same of which Dr. Bryant speaks in his account of the nesting habits of the wood ibis (Proc. Bost. Soc.). Is our correspondent confident about this species feeding on aquatic plants? We had always supposed that its food was almost wholly animal—aquatic reptiles, fish, crustacea, etc., etc. Compare Audubon's account of the species, also C. (11-13)]

WHAT OUR DUCKS EAT.—A friend, interested in a note which recently appeared in FOREST AND STREAM, entitled "What the red-head ducks eat," has forwarded to us the contents of the craw of a pintail duck, *Drifila acuta*, suggesting that a determination of its food may be interesting. The specimen was killed near Saybrook, Conn., Nov. 6, 1877. The mass of the material sent to us consists of three species of seeds together with a few minute shells. These last were mainly, if not altogether, a species of *Limnaea*, probably *L. humilis*, although in our first examination we thought we detected a specimen of *Planorbis*, which a re-examination of the material failed to reveal a second time. The seeds, which were kindly identified for us by Prof. D. C. Eaton, of New Haven, consisted of a few grains of rye, a few specimens of the seed of *Ruppia maritima*, Linn., a species which it will be remembered was very abundant in the craw of the red head duck re-

ferred to in a previous issue of FOREST AND STREAM, and a great quantity of the seeds of *Zamuchella palustris*. Concerning this latter plant Prof. Eaton writes us that it is "found in ponds and slow streams from New England to Florida, Bahamas, Utah, Europe, India, etc., though after all not a very common plant. I have it from the Connecticut River, near Saybrook, or rather from ditches near the river." It is interesting to note that the duck from which the seeds were taken was killed precisely in the locality given for the plant, a fact of which Prof. Eaton was ignorant when he identified the species.

—The FOREST AND STREAM is of course correct in its disbelief of the muddled and very erroneous paragraph which appeared in a news column of this paper two weeks ago as to some of our chief game-birds. The true name of our partridge, which we have so long been familiar with, is quail, and is claimed by some to belong to the grouse family; our commonly known pheasant is the ruffed grouse. It is the partridge of New England, and we have more than once been bothered at accounts of its food, habits, weight, etc., in the local papers of that section.—*Germantown Telegraph*, Nov. 21.

COLUMBIAS.—Greene Smith, Esq., is especially interested in the family of birds, the study of which has afforded pleasure to "fanciers for many generations. We are pleased to print for him the following letter:

KENNINGTON, COOK COUNTY, Ills.

EDITOR FOREST AND STREAM: Sir—Please allow me, through your columns, to thank Mr. Ira A. Paine for his kind presentation of a beautiful pair of blue rocks. I have studied them at the trap (sometimes mournfully), but never in their wild state. His addition increases the number of species in my collection of *Columbias* to thirty-six.

Respectfully yours,

GREENE SMITH.

## A CAT TOLLING DUCKS.

BALTIMORE, NOV. 16, 1877.

EDITOR FOREST AND STREAM:

While on a ducking expedition a few days ago on Back River near this city I witnessed something quite new to me, and I send it to you as it may be new to many of your readers. On the shore of a deserted house the family had left a black cat. This animal, having to depend upon her natural resources for food, adopted the novel expedient of tolling some ducks, and when seen by the writer was actually engaged in running up and down the shore, while four canvas-backs were coming straight in to her; and in a few minutes one would no doubt have fallen a victim to the curiosity of the bird, but the writer trod upon a stick in the effort to get near enough for a shot, which attracted the attention of the cat and the curtain fell. I am a ducker of twenty years' standing, have heard of foxes tolling ducks by wagging their tails and leaping along the shore and getting them too; have heard of ducks coming in to a cow's tail on the shore, but never heard of or saw a cat engaged in the operation. If any of your readers know of anything of a similar nature, I should like to hear of it through your columns.

Respectfully,

C. L. O.

## QUAIL AT SEA.

Mr. Editor: I am naturally interested in the article headed "Quail at Sea," in your last issue, and should like to know more of the strange birds your Norfolk correspondent speaks of. Will he not send me a specimen? The description he gives is not recognizable. It is not in the least improbable that a non-indigenous species should reach our shores. Europe and America have many a time exchanged stragglers of numerous species of birds.

The gentleman who writes from Baltimore strangely misquotes me when he says that page 236 of my "Key" states that "the differences between the European and American birds (quail) are hardly appreciable." As I have labored many times to impress upon the American public, in these columns and elsewhere, the American Bobwhite (*Oryzopsis virginiana*) is of a different species and of a different genus, and of a different sub-family, from either the European partridge (*Perdix cinerea*) or the European quail (*Coturnix coturnix*). What I did say in the place mentioned was this: "It is highly improbable that, as a group, they (i.e., the forty or more species of American partridges) are separable from all the forms of the latter (i.e., the many species of Old World partridges) by any undecided peculiarities," meaning thereby, as is clear from the context, that it is hard to draw the technical line between the New World and Old World species collectively, not that every one of our forty kinds of partridges is not perfectly distinct, generically and specifically, from any and every one of the Old World forms. Yours truly,

ELLIOTT COUES.

Smithsonian Institution, Washington, D. C.

[REMARKS.—We are persuaded that the quail met at sea were unquestionably the identical birds imported from Europe not many weeks ago by Mr. Everts, of Vermont.

We have several important communications on this subject which will appear in our next issue.—Ed. F. & S.]

## SPLIT BAMBOO RODS.

To our customers and the public:—In reply to the damaging reports which have been circulated respecting the quality of our split bamboo rods, by "dealers" who are unable to compete with us at our reduced prices, we have issued a circular which we shall be pleased to mail to any address, proving the falsity of their assertions.

CONROY, BISSETT & MALLISON,  
Manufacturers, 65 Fulton Street, N. Y.

—To be true to one's self is to be true to the world. This is equally true in the commercial and moral duties of life. H. T. Babbitt was desirous of making a toilet soap perfectly pure and good, something that should not cover up evil and disease under the mark of fragrance. Result: his Toilet Soap, which for every excellence reaches about as far as chemical art can go.—*Advt.*

—See advertisement of Land-Locked Salmon Spawn in this week's issue.—*Advt.*

## Woodland, Farm and Garden.

THIS DEPARTMENT IS EDITED BY W. J. DAVIDSON, M.D. N. Y. HORTICULTURAL SOCIETY.

## ENGLISH NAMES OF WILD FLOWERS AND PLANTS.\*

(Continued.)

THE medical beliefs revealed by many names are not less curious than their legendary associations. It was the opinion of the old herbalists or simplers that God had not only provided special plants as a cure for every disease, but had made their curative power evident by stamping them with some resemblance to the malady they were meant to heal; and this faith, known to students of our older botany as the "Doctrine of Signatures," lurks or reveals itself in many an English name. The Lung-wort, spotted with tubercular scars, was a heal for consumption; the Liver-wort, liver-shaped in its green fructification, was a specific for bilious maladies; the scaly pappus of the Scabious for cutaneous eruptions; the throat-like corolla of the Throat-wort, or Canterbury Bell, caused it to be administered for bronchitis; the Saxifrage, cleaving the hard stones with its penetrating fibres, was efficient against calculus; the Scorpion grass, now known as the Forget-me-Not, whose flower-spoke dimly resembles a scorpion's tail, was an antidote to the sting of that or other venomous creatures; the Moon-daisy averted woe; the Birth-wort, Kidney-Yetch, Nipple-wort, Spleen ingrt, were all appropriated, as their names suggest, according to resemblances, real or fancied. The pretty Toad-flax of Bell walls and hedges owes its name to a strange mistake, conceived to be the cure for a complaint called buboes, it is and is the Latin name *bubonium*. A confusion between *bubo* and *bufo*, which is Latin for a toad, gave birth to its present name; and stories were not long wanting that sick or wounded toads had been seen to eat of it and to recover health.

Similar distortions occur in non-medical names, and it is most curious to notice how soon a story springs up or a belief asserts itself in confirmation of the mistaken identity. The common Tumbitory, which we have already noticed, received its name of *June-terre*, "earth smoke," from its causing the eyes to smart and water when applied to them, as smoke does. The meaning was lost as time went on, and was supplied by the belief that it was produced without seed by smoke or vapor rising from the earth. Buttercup was said to give color and flavor to butter, as being eaten by cows when in blossom; the facts being that it is a corruption of *bouton-cop*, button-head, and that cows eat the grass all round it, but always, if possible, avoid it. Meadow-sweet is a corruption of Mead-wort, honey-weine plant, a beverage being still extracted from it by cottagers. Bull-rush is Pool-rush, as growing in pools, not in mud; Snap-dragon is Snout-dragon from its shape; Marigold is Marsh-gold; Sweet-William is *aile*, a little eye; Pink is the lower German *Pinkstein*, Pentecost, from its flowering at Whitsuntide, the name being transferred first to the color of the flower, then to a method of working flowers on muslin, called pinking; and so to the sword-stab in a duel, piercing or pinning an adversary as the needle pierced the cambric. Nightshade is *night-scada*, soother or anodyne; Samphire is St. Pierre, from its love of rocks; Sanicle is St. Nicholas, the restorer of the three murdered children, from its healing powers; Poplar comes from the Indian *Popul*, whose leaves when varnished and painted closely resemble those of the large Spanish Poplar; Primrose was anciently the Daisy; and is called by the Chaucer *Prinrole*, from the old French *Primerole*, the first spring flower; *Primerole* was changed to *Primroles*, then to *Primrose*, the first Rose of spring; and it was not till the sixteenth century that it attached itself to the familiar flower which now bears its name. Cowslip is more strange still. It was originally "hose-flap," and belonged to the Mullein, whose great flannel leaf might well be likened to the flap or skirt of a woolen under-garment. Later on it was transferred to the wild *Primula* of our meadows, and the mistake was stereotyped by the unlucky botanist, who, in ignorance of its origin, gave the name of Oxlin to its pretty congener, the *Primula elatior* the Jerusalem Artichoke is a Sun-flower, not an Artichoke; but the tubers resemble the Artichoke in flavor. From its Italian name, *girasole*, turn to the sun, came Jerusalem; and by a further quibble the soup made of it is called Palestine soup. The Forget-me-Not was originally the "Germander Speedwell," whose blossoms, falling off and flying away as soon as it is plucked, gave emblematic force to the name. It was known in the days of chivalry as the "flower of sovereignty," and was embroidered into the collars of the knights, a fact still recalled by its German name; *Ehrenpreis*, Prize of Honor. About 200 years ago we find the name given to the Ground Pine, *Ajuga Chamapitys*, whose nauseous taste once realized can never be forgotten. Finally it was seized upon by the river-side, Myosotis, and forthwith sprung up a charming legend, created obviously to suit its latest identification—how that while two lovers loitered by a lake, the maiden saw and longed for the bright blue flowers, the knight plunged in to get them, but, unable to regain the shore, had yet agility enough to fling them into his lady's lap, and then, with a last devoted look and the words "forget me not," sank below the waves forever.

Many names of plants contain the geography of their origin. The Canterbury Bell is obvious, so is the Guelder Rose. The Alexanders, a rare point round Taunton, but growing in great quantities at Blue Anchor, comes from Alexandria; the Candy-tuft from Candia, the Elecampane from Campana, the Medick from Media, the Carraway from Caria, the Walnut or Welsh Nut from the north of Italy, called *Walsh* by the Germans. Peach is *Persicus*; Shalot, *Ascalonium*; Spinach, *Hispionicus*; the Damson, rightly spelt as Damascene, tells its own tale, which is less clear in the case of the Dame's or Damascene Violet, a corruption extended and perpetuated, as often happens, by its Latin equivalent, *matronalis*.—*Nature*.

(To be continued.)

SOUTH CAROLINA CUCUMBERS.—A Massachusetts gentleman—not a politician—who is now residing in Columbia, S. C., owns a plantation near Port Royal, of which he writes to the editor of this paper, privately, as follows:

I think, as you seem to, that it is strange everybody presumes

\* Lecture by Rev. W. Tuckwell before the Somersetshire Archaeological and Natural History S.

by the vicinity of P. R. in going South. It is a much better point for market gardeners than Florida. I had one-eighth of an acre of cucumbers last spring and commenced shipping at the same time with Ford folks near Cedar Keys. I got 130 bushels from the one-eighth acre. Mr. Frost at Fords, g. 700 bushels from an acre and a half. Mr. Frost did not write me exactly what he got net for his crops, but I am satisfied I received full fifty per cent. better prices than he did. My one-eighth acre paid over \$200 profit, I think \$225. Moreover, the parties I sent to said they had never seen so good and fresh Southern cucumbers. A competent gardener with sufficient capital could coin money on my place. The thing to do would be to cover a couple of acres with glass, start up operations in October and November and ship to New York in December and all winter long. This in addition to early spring crops. I am not an agriculturist, and do not propose to become one.

**HARDNESS OF WOODS.**—It is a great convenience to know the comparative value of different kinds of wood for fuel. Shellbark hickory is regarded as the highest standard of our forest trees, and calling that one hundred, other trees will compare with it for real value as fuel for house purposes as follows: Shellbark hickory, 100; pignut hickory, 95; white oak, 84; white ash, 77; dogwood, 75; scrub oak, 73; white hazel, 73; apple tree, 70; red oak, 69; white beech, 65; black birch, 62; yellow oak, 60; hard maple 59; white elm, 58; red cedar, 56; wild cherry, 55; yellow pine, 54; chestnut, 52; yellow poplar, 51; butternut, 43; white birch, 43; white pine, 30. It is worth bearing in mind that in woods of the same species, there is a great difference, according to the soil on which they grow. A tree that grows on a wet, low, rich ground will be less solid and less durable for fuel, and, therefore, of a less value than a tree of the same kind that grows on a dry and poorer soil. To the ordinary purchaser, oak is oak, and pine is pine, but for home use, the tree grown on dry upland, and standing apart from others is worth a great deal more.

**NOTICE TO SPORTSMEN.**—Having received so many communications asking us for information in regard to our six-section bamboo trout, black bass, grilse and salmon rods, we have prepared a circular on the subject, which we shall take pleasure in forwarding to any address. We keep on hand all grades, the prices of which range from \$15 to \$150. We put our stamp only on the best, in order to protect our customers and our reputation, for we are unwilling to sell a poor rod with a false enamel (made by burning and staining to imitate the genuine article) without letting our customers know just what they are getting.

ABBEY & IMBRIE, 38 Maiden Lane.

## The Kennel.

TO CORRESPONDENTS.—Those desiring us to prescribe for their dogs will please take note of and describe the following points in each animal:

1. Age. 2. Food and medicine given. 3. Appearance of the eye; of the coat; of the tongue and lips. 4. Any changes in the appearance of the body, as bloating, drawing in of the flanks, etc. 5. Breathing, the number of respirations per minute, and whether labored or not. 6. Condition of the bowels and secretions of the kidneys, color, etc. 7. Appetite; regular, variable, etc. 8. Temperature of the body as indicated by the bulb of the thermometer when placed between the body and the foreleg. 9. Give position of kennel and surroundings, outlook, contiguity to other buildings, and the uses of the latter. Also give any peculiarities of temperament, movements, etc., that may be noticed; signs of suffering, etc.

## THE PHILADELPHIA BENCH SHOW.

PHILADELPHIA, Nov. 26, 1877.

With such excellent sponsors as Messrs. Richards, Wister, Grubb, Sartori, Furness, Emien, Winsor, Bailey, Hoffman, Fassitt, Janney, Davis, Sergeant, Biddle, Davis, Gardiner, Scofield, O'Brien and De Sauque—all gentlemen known for their sportsmanlike qualities and social position—the Philadelphia Dog Show, under Mr. Thatcher Goddard's able management, opened to-day with the greatest eclat.

In matters regarding dog exhibitions there has been more than once manifested a certain amount of jealousy from the strangest quarters, for which there were no possible reasons. New York, sometimes assuming a certain prestige, is inclined to belittle or pooch-pooch the efforts made by other cities tending toward having the bench shows. It lies neither in the power, fortunately, of a few individuals in either New York or Philadelphia or Chicago to lay down the law in regard to such matters. In the present case of the Philadelphia Bench Show, efforts were made to belittle it and to cast exceedingly unjust motives in the *entrepreneur* of the exhibition. Some exceedingly absurd term as of "hippodroming dogs" (whatever that might mean) was advanced. Is the rule to be laid down that no town or city is to have a dog show where there is no regularly organized kennel club? Such an idea has no common sense. The slurs cast on the Philadelphia Bench Show were very much out of place. Really there never has been a kennel club in Philadelphia until to-day. About the time of the New York Dog Show certain gentlemen did meet, however, in Philadelphia, and the chances of organizing a kennel club were talked over. Mr. T. C. Johnson was made temporary chairman and Mr. W. R. Knight secretary. A constitution and by-laws were to have been drafted, but eventually it came to nothing. However, within the last few days, Mr. Thatcher Goddard having, by his straightforward manner, convinced the leading gentlemen in Philadelphia that such an exhibition as he intended giving would advance the interests of breeders of dogs in the State, a kennel club was organized a week ago which gave its sanction to Mr. Goddard's most worthy efforts. It must be then said to the credit of the manager of the present bench show, that it was through his exertions that an association was formed in Philadelphia which will, no doubt, be a credit to the second city in America.

Our correspondent went early to Horticultural Hall just as many of the animals were coming in. Perhaps there is nothing in the world more confusing than the initiatory movement of a dog show. In the present instance there was hardly any trouble, and order soon reigned supreme. By mid-

day all the dogs were in their boxes, well numbered, so that there was no trouble by means of the catalogue of finding any animal required.

A dog show, like a gallery of pictures, is something which requires long study. To seize in all at a single glance is quite impossible; it takes time and study before one can do anything like justice to a show, where over 550 animals are exhibited.

Passing over the classes 1 and 2, fine beasts whose excellencies have been freely extolled, we come to the No. 6, a fine setter called Fame, owned by Messrs De Roncé & Inman, of New York. Fame shows notably such good blood as comes from Pride of the Border. Here is the No. 9, called Echo, the property of Mr. Collett. No. 9 is the hugest pointer in the show, and among the biggest dogs of his kind we ever saw. How, as we were informed, having Laverack blood, he grew so elephantine we cannot imagine. Gigantic as he is he is almost perfect as to symmetry. No. 23, Don, the property of C. S. Boucher, of Easton, has all those choicest traits which Bismarck gave. It must be remembered that two better perpetrators of that breed than Bismarck and the Gildersleeves dogs never lived. The Bismarck blood is quite visible in numerous setters. Perhaps there is a shade purer blood and finer lines in the white Bismarcks than in the Gildersleeves. The No. 24 in the same class, called Sing, the property of Mr. Emien, of Philadelphia, has many sterling points. The strain which came from the Dickerson Lergeat's dogs was almost excellent. The No. 34, Frank, a four or five-year old dog, was a handsome, well put up brute. In the setter bitches the No. 57, a beauty by the name of Daisey, must find many admirers. We should think that there was a strong dash of Laverack about her. In the same class of puppies there were a number of good ones. The No. 84, Ned, of 10 months, was perfect in form. Of the bitch puppies, 92, Dolly, was a choice animal, with very clean build. Of class 7, imported red, or red and white Irish setters, the whole collection was good. If there would be a preference, it might be on our part towards Mr. E. T. Fassitt's Sport. In class 8 there were numberless choice animals. We commend Dash, the No. 99, as a superb dog. The numbers 100, 101, 102, Jim, Bryan and Trump, are fine dogs, of a roan color. They are big, lusty animals, and show extraordinary points. They owe their sterling qualities to a good dash of Ludlam's Dash. Mr. Furness is the owner of Jim and Bryan, and Trump is the property of Mr. Biddle. Mr. Tlesston's Limerick is a fine dog, and shows his Plunkett lineage. Going rapidly along, in class 10, the pointers, we thought Mr. Austin's Samurai a liver and white, a fine animal, though he might have lost a point over him, being a trifle too flat-headed. The dog, we believe, comes from the Cadwallader stock. If, on the whole, the pointer classes were not as extensive as the setters, they were all good beasts, and exhibited fine traits, though, as a whole, the setters excelled them in purity of form. It must be remembered that, with very few exceptions, all the animals are actually working dogs, and just as good for the field as for shows. Water spaniels, class 14, were not entered as a collection, though the No. 187, Sam, the property of Mr. W. D. Winsor, an Irish dog, was a very choice one. It is in running dogs where Philadelphia has come out wonderfully strong. In fact, we are quite decided that the best foxhounds we have seen yet on the show bench were examined by us to-day. Within a radius of thirty miles of Philadelphia there are kept about five packs of hounds—the famous Rose Tree pack from Medea, with the no less excellent Leopard pack, and the Marshallton, Gulf, and Westchester hounds. The Rose Tree dogs, some ten of them, were the same of dogs, and would have stood well in any English show. Mr. Frank Cayton, who has the Marshallton pack, exhibits fine hounds. The Messrs. Cayton have been fox hunters from father to son for the last seventy-five years. The No. 212, Fleet, owned by J. B. Roe, is a marvellous dog for beauty, with long head and pendant ears. In Beagles the show is admirable, the No. 226, Queen, 228, Fly, being nice little ones. The Dachshunds never before came out stronger. Here is Dr. Twaddell's Waldman, who came from the Duke of Baden's kennel, who, good-natured at home, despises a bench show, and shows his temper at times, with the likely No. 236, Unser Fritz, almost as fine a dog as Waldman, and even some think him better. Anyhow, many must deem him so, as Unser Fritz always takes a prize. In dachshund bitches Mr. Allen's Spot, with Corn, are very fair animals.

In greyhounds the collection is quite good. There is a brindle (not a favorite color) called Aco, which is a beautiful brute.

We have been always differing with our critics in regard to the Newfoundland *pur sang*. Almost all the dogs brought to the show bench as pure Newfoundlands are the wrong dogs, they are too big. Philadelphia is the home of the real small sized Newfoundland. He is *straight, flat haired*, with no curl about him; there are quite a number of such on exhibition, Mr. Picot, we think, leading with his stock. New York we fancy, must claim superiority in that noble St. Bernard, called Dan, the property of John P. Haines. There are so many Germans in Philadelphia, that it is not surprising that the Dalmatians and Siberian dogs are so well represented. For fancy dogs, we have long known from personal experience, that for Pugs, Black and Tan, Skye Terriers, Scotch Terriers and Whitefels, Philadelphia had more of them and of choicer breed, than any other city in the Union. The Pugs alone are better than we have ever seen before, and so are all the fancy terriers.

Let us say a word about Poodles. There are Poodles here that would make a Frenchman wild. This is the secret why only Philadelphia, besides being a city where there are no end of the good things to be had, excels in Poodles. In the time of the old Volunteer Fire Service, when the Moya and the Fairy used to exterminate one another in street fights, they always kept poodles which went to fires. Though the men quarreled, the dogs did not. Hence the choicest breeds of Poodles were sought for and fostered, and as we have been informed, the Philadelphia paid Fire Department of to-day keeps up the same canine tastes. In a brief summary of this kind, we can only in a hurried manner indicate the dogs which struck our individual fancy here and there.

To conclude, then, this brief account—at least for the present.—Mr. Goddard has succeeded in bringing together a collection of animals which are excellent, and all classes are well represented. We sincerely trust that many of a visit will friends will go to Philadelphia, for the trouble of a visit will be amply repaid by the satisfaction they will have in seeing how fully the finest breed of dogs are represented in Philadelphia. The attendance was excellent, many of the most elegant ladies of Philadelphia having paid their first visit to a dog show.

LIST OF JUDGES.—Pointers and Setters of all Classes.—William Winsor, John B. Sartori, George Emien.

Spaniels and all Water Dogs.—Frank Furness, Dr. W. Lower, U. S. N., William Winsor.

Foxhounds, Fox-terriers, Beagles, Dachshunds, Greyhounds.—Benjamin W. Richards, President Sportsman's Club.

All Non-Sporting Dogs.—William Wister, James B. England.

Owing to this being a holiday week, it is impossible for us to print the list of entries which we have procured and intended for this issue, which we much regret. It will appear next week.

## ST. LOUIS BENCH SHOW.

The date for holding this great show has been fixed for the 19th, 20th and 21st of February, 1878. The prizes will be given in cash, and will be the largest ever offered in this country. Indeed, the amount offered exceeds that of any show in England. The prospect of the show is good. No doubt many of our Eastern cracks will go down to compete for the handsome prizes. The committee are working hard to make a great success of it. The St. Louis Show should beat the West what the New York Show was to the East. We will do what lies in our power to make it so. We append the following letter from our special correspondent:

ST. LOUIS, Nov. 22, 1877.

EDITOR FOREST AND STREAM:

I enclose you the list of regular cash prizes to be given at the forthcoming bench show of the St. Louis Bench Show and Sportsmen's Association, which will be held February 19th to 22d (inclusive) next in this city. The Association is organized and the committees at work. The officers are: President, E. Hayden, manager American Express Co.; Vice President, J. A. Wherry, wholesale boots and shoes; Secretary, J. W. Munson; Treasurer, H. S. Brown, of Brown, Hildegarde and rifles; Directors—E. C. Sterling, President, Hydraulic Press Brick Co.; C. Jaff Clark, of Clark & Fennett, metal dealers; W. L. Scott, Secretary Belchers Sugar Refinery. About one hundred leading business and professional men have subscribed \$3,000 for cash prizes, and a list of special will put up \$2,000 more. In addition to the bench show there will be exhibitions of sportsmen's goods, guns, rifles, fishing tackle, hunting suits, etc., etc., and liberal prizes will be given for them. As soon as the prize list, sportsmen's goods is completed I will send it to you. I hoped eastern dogs will be here in force, for it is the intention of the Board of Directors to make prizes won at our show honor to the winner. At this early day a number of breeders have promised to come here. Very respectfully,  
J. W. MUNSON, Secretary.

### DIVISION I.—SPORTING DOGS.

Class 1.—Setters (English, both imported and native), Dogs and Bitches, champion class, free for all.—For the best dog, \$50; for the best bitch, \$50.

Class 2.—Setters (Irish, both imported and native), Dogs and Bitches, champion class, free for all.—For the best dog, \$50; for the best bitch, \$50.

Class 3.—Setters (Gordon, black-and-tan or black, white and tan, both imported and native), Dogs or Bitches, champion class, free for all.—For the best dog or bitch, \$50.

Class 4.—Pointers (large size) Dogs or Bitches—Dogs 55 pounds and upward, bitches 50 pounds and upward.—Champion class, free for all.—For the best dog or bitch, \$50.

Class 5.—Pointers (small size) Dogs or Bitches—Dogs not exceeding 55 pounds, bitches not exceeding 50 pounds.—Champion class, free for all.—For the best dog or bitch, \$50.

### OPEN CLASSES.

No dog or bitch is qualified to compete in classes six, seven, eight, nine, ten, eleven and twelve who has ever won a first prize at Chicago, Baltimore or New York.

Class 6.—Setters (English, imported or their progeny) Dogs and Bitches.—For the best dog, \$30; for the second best dog, \$20; for the third best dog, \$10; for the best bitch, \$30; for the second best bitch, \$20; for the third best bitch, \$10; for the best dog or bitch puppy over six and under twelve months of age, \$15; for the best dog or bitch puppy under six months of age, \$10.

Class 7.—Setters (English, native or crossbred) Dogs and Bitches.—For the best dog, \$30; for the second best dog, \$20; for the third best dog, \$10; for the best bitch, \$30; for the second best bitch, \$20; for the third best bitch, \$10; for the best dog or bitch puppy over six and under twelve months of age, \$15; for the best dog or bitch puppy under six months of age, \$10.

Class 8.—Setters (Irish, imported or their progeny) Dogs and Bitches.—For the best dog, \$30; for the second best dog, \$20; for the third best dog, \$10; for the best bitch, \$30; for the second best bitch, \$20; for the third best bitch, \$10; for the best dog or bitch puppy over six and under twelve months of age, \$15; for the best dog or bitch puppy under six months of age, \$10.

Class 9.—Setters (Irish, native or crossbred) Dogs and Bitches.—For the best dog, \$30; for the second best dog, \$20; for the third best dog, \$10; for the best bitch, \$30; for the second best bitch, \$20; for the third best bitch, \$10; for the best dog or bitch puppy over six and under twelve months of age, \$15; for the best dog or bitch puppy under six months of age, \$10.

Class 10.—Setters (Gordon black and tan, or black, white and tan or crossbred, imported or native) Dogs and Bitches.—For the best dog, \$30; for the second best dog, \$20; for the third best dog, \$10; for the best bitch, \$30; for the second best bitch, \$20; for the third best bitch, \$10; for the best dog or bitch puppy over six and under twelve months of age, \$15; for the best dog or bitch puppy under six months of age, \$10.

Class 11.—Pointers (large size) Dogs and Bitches, dogs not exceeding 55 pounds, bitches not exceeding 50 pounds.—For the best dog, \$30; for the second best dog, \$20; for the third best dog, \$10; for the best bitch, \$30; for the second best bitch, \$20; for the third best bitch, \$10.

Class 12.—Pointers (small size) Dogs and Bitches, dogs not exceeding 55 pounds, bitches not exceeding 50 pounds.—For the best dog, \$30; for the second best dog, \$20; for the third best dog, \$10; for the best bitch, \$30; for the second best bitch, \$20; for the third best bitch, \$10.

Class 13.—Pointer Puppies, Dogs or Bitches.—For the best dog or bitch puppy over six and under twelve months of age, \$15; for the best dog or bitch puppy under six months of age, \$10.

Class 14.—Chesapeake Bay Dogs.—For the best dog or bitch, \$20; for the second best dog or bitch, \$10.

Class 15.—Chesapeake Bay Dogs.—For the best dog or bitch, \$20; for the second best dog or bitch, \$10.

Class 16.—Irish Water Spaniels, Dogs and Bitches.—For the best dog, \$20; for the second best dog, \$10; for the best bitch, \$20; for the second best bitch, \$10.

Class 17.—Retrieving Spaniels (other than pure Irish), Dogs and Bitches.—For the best dog or bitch, \$20; for the second best dog or bitch, \$10.

Class 18.—Spaniels (Cockers), Dogs and Bitches.—For the best dog, \$20; for the second best dog, \$10; for the best bitch, \$20; for the second best bitch, \$10.

Class 19.—Spaniels (field, other than cockers), Dogs or Bitches.—For the best dog or bitch, \$20; for the second best dog or bitch, \$10.

HYDROPHOBIA.

WE mention it with regret, since medical epidemics may be catching, that in England the alarm in regard to hydrophobia is on the increase. Even that greatest of all journals, the *London Times*, has devoted a lengthy editorial to this subject. The endeavor is made to assimilate, at least in the effects, the local disorders caused by hydrophobia, with tetanus. The *Times* has little or no faith in cautery. The *Times* lays great stress on a method of treatment depending on the use of curare, and cites a case of positive hydrophobia cured by Dr. Offenbourg, at Munster, in Westphalia, by this new agent. It is proper to notice that curare is a terrible drug to handle, being one of the most violent poisons known. The article in the *Times* concludes as follows: "It seems incumbent upon medical men, to whom the opportunity is afforded, to make a fair trial of a plan of treatment which rests upon a rational and scientific basis, and which has, so far as this single case is concerned, already been justified by success." As to curare, it has the property of taking away muscular action, and the supposition is that it is this muscular movement, these spasms, often repeated, under which the unfortunate succumbs.

We think it our duty to give the account of the alleged cure in its fullest details—we would even like this most important matter to have the fullest publicity:

The following account of the cure of a case of genuine hydrophobia by the administration of curare or wourali (the Indian arrow-poison) will no doubt interest your readers, as it shows that this disease may prove less fatal than has hitherto been believed. The use of curare has been recommended by both English and foreign physicians, but no published account has hitherto appeared of its successful administration. The following is extracted from a treatise by Dr. Offenbourg, who treated the case at Munster, in Westphalia, On the 23d of July, 1874, a peasant girl, aged 24, was bitten on the foot by a rabid dog. Several dogs had been previously destroyed in the neighborhood, and a farmer had died of hydrophobia at the adjoining farm. The wound became gradually worse, and refused to heal, and she was therefore admitted on the 8th of October to the Franciscus Hospital. Favorable progress was made during the first week, but at 8 p. m. on the 16th, the usual symptoms of hydrophobia suddenly appeared. Convulsive spasms of the throat and chest, contractions of the muscles, restlessness, mental terror, increased every minute, and were soon followed by antipathy to light and to water, the sight of which produced violent convulsions. Morphine and chloroform having been given without result, a subcutaneous injection of three centigrammes of curare was made at 10:45 p. m. into the arm, and during the next four and a half hours five more injections were made, the quantity varying from two to three centigrammes. After the second injection the spasms began to diminish, and to appear at longer intervals, and the terror and mental anxiety were succeeded by loquacious cheerfulness. At 3:20 A. M. the first symptom of paralysis appeared, and on two occasions a spasm was followed by complete cessation of respiration, which was quickly restored by compression of the abdomen. The spasms continued to diminish, while the paralysis of the muscles increased, and movement and speech became extremely difficult. But after 7:30 A. M. these symptoms became less intense, and the patient was able to quench her thirst without pain or ill results. The improvement continued during the day, headache and great weakness being the most marked symptoms. On the 18th some slight return of spasm induced the administration of three centigrammes of curare as a measure of precaution, and after this the recovery was rapid and uninterrupted. On the 24th the patient ate some bread and milk, and enjoyed good sleep; on the 27th the headache finally disappeared; and on the 3d of December, the wound having completely healed, she returned to her home. When visited on the 19th, she merely complained of slight weakness and a dislike to very strong light. The above case seems to prove that curare must be employed in paralyzing quantities to insure a good result. It seems probable that after inoculation with the poison of rabies a certain organic substance is developed, which rapidly produces its dreadful effects on the nervous system, and as rapidly disappears, either by expulsion or by transformation, into innocuous substances. Curare arrests and paralyzes for a time the action of the poison, and during this period the expulsion or transformation alluded to is effected. Its use cannot be too strongly recommended; there is nothing to lose and everything to be gained, and in the above case at any rate it proved completely successful."

SUGGESTIONS AS TO CLASSIFICATIONS AT BENCH SHOWS.

EDITOR FOREST AND STREAM: NEW YORK, Nov. 25, 1876.  
I beg to offer you certain suggestions in regard to classifications of dogs at bench shows, which may be worthy of consideration. My own opinion is that where classes are formed for imported dogs, they should be open only to such animals as are imported, and that all dogs bred in America and whelped here should compete in native classes. This will soon bring out the fact and dispose of the vexatiously disputed question as to whether the importation of setters is an improvement or the contrary, by bringing the produce of importers into direct competition with the natives. Of course a dog bred on the other side and imported in *utero* is an importation and should be so regarded. I never knew why Class 9 in the W. K. catalogue (black and tan, or black, white and tan Gordon setters, either native or imported) was made to differ so radically from 5 and 7 (Class 5—Imported English setters or their progeny of the first generation. Class 7—Imported red, or red and white setters, or their progeny of the first generation.) With a few sensible alterations the classification of that catalogue will be as good as can anywhere be found.

Y. A. R.  
[The suggestions made by our correspondent we think well worthy of attention, especially as they proceed from a gentleman whose experience in regard to bench shows and field trials is second to none in the country. There is no reason why dogs bred in America, whose stock is imported, should not to-day compete with native classes. If a few years ago, a distinction might have been made; at present, such differences no longer exist.—Ed.]

PLUNKET, RANGER AND RUFUS.—Mr. Geo. S. Fowler, of Fort Wayne, Indiana, has a Nellie and Ranger bitch, dropped

will have, nine times out of ten, the pleasure of seeing him stand as still as a stone. Don't abuse him. This will teach him to be staunch. As he grows older, should he turn a deaf ear to your entreaty, resort to the whip. When on a point command him to Go, and should he refuse, follow at once with a crack of the whip, this will effectually break him of this evil way. To teach a dog to retrieve, and to do it well, is one of the most important parts of his education. Take him in one of his playful moods an hour or so after a light meal and, with an old leather glove, a few evenings work will teach him to retrieve and to do it well. Never whip a dog for not retrieving, and always caress him when well done, and it will soon become a pleasure to him. If a shot has proved ineffective I tell him "Lost," and mean just what I say. With a little training any dog of moderate brains will soon learn what is wanted, and do it. If I want my dog to be steady, I raise my hand and shake it. This is one of the easiest signs learned by a dog, and once learned never forgotten. If I want my dog to hunt certain ground, I motion him there. This power of motioning a dog when you want him is almost indispensable in working dogs in braces, and is one part of a field education that no dog should ever be without; and it is remarkable how quick a well-trained dog catches any sign from his breaker when once trained to obey them. I once knew a pointer who was so well trained in this respect that when his breaker would get down and crawl up to game the dog would crawl along on the ground, and when his breaker would get up he would do likewise. If crossing a fence a single motion of the hand would stop him there. Most good breakers of the present day train their hounds to drop to shot, and with the vast majority of men who handle dogs this is undoubtedly the best. I far prefer having a dog trained to stand "firm as rock of castle roof," no matter if a bird is fluttering within three feet of his nose.

This, if properly learned, is the crowning part of a dog's education, and the noblest part of his field performance. I once owned a dog whose education in this respect was perfect, and many, many times have I seen him work down a covey with a precision that was not excelled by any human being, and at a motion from the hand he would raise his head and trot straight to a point. I do not think I would advise novices to try to teach a dog to stand. It is the hardest lesson of a dog's life to learn to stand on all occasions, and his breaker must remain as cool and impassioned as an iceberg to keep his dog from falling from grace. Backing is one of the easiest portions of a dog's education, and you might justly say natural. I never owned a well-bred dog from trained parents that would not back intuitively. Hence, in this you have only to teach your puppy to stick to first principles. LOTHAIR.

New Albany, Miss., Nov., 1877.

MOUTHING BIRDS.

EDITOR FOREST AND STREAM: LE ROY, Nov. 19, 1877.  
Three of us were out shooting ruffed grouse on Saturday last. Our success had been poor, and we drove to a small piece of woods where we hoped to find birds plenty. My dog, a setter, found several, but we all missed them. Upon getting within ten feet of a large stump my dog came to a fine point, and as we were coming slowly up he suddenly made a spring behind the stump. Hearing a fluttering I called very sharply to him, and he appeared, bringing a grouse in his mouth. The bird made a great noise, and he was obliged to put it down three times before he could put it into my hand. The bird was perfectly sound and strong and would have flown away immediately if it had been free. I never knew my dog to do anything like it before, and he did not attempt it again. Possibly he thought if none of us could shoot one he would catch one. Have you ever known of a similar instance, and should I have punished my dog for it? As it was I paid no attention to him at all. Yours, OATKA.

[It is quite probable that the bird had been body shot by some other party shooting in the vicinity, and had flown over into your neighborhood; in which case the dog felt justified in retrieving a wounded bird. If a similar circumstance should occur again, we should incline to the opinion that the bird was a close-lie, and that the dog was to blame for running in and standing on his point. A suitable punishment should then be given, especially if he is a young dog and pliant in his disposition. We have occasionally seen ruffed grouse lie so close that it was necessary to kick them up out of their cover. This habit is more common with the grouse of the prairies; but when snow is on the ground the ruffed grouse burrow under it, so that they are completely hidden, and it is often impossible to get them up at all.—Ed.]

FIELD TRAINING.

NEWARK, N. J., Nov. 21, 1877.  
Mr. Editor—In perusing the last issue of the *FOREST AND STREAM* AND ROD AND GUN my attention was attracted to your complimentary reference to Mr. Wannaker and his commendatory efforts at dog-breaking and training, but more especially at the point made under the following remark: "As far as we know Mr. Wannaker is the only dog-breaker in the country who takes his pupils in game countries for practical instruction and a varied course of study." Feeling assured that your intentions are to encourage all such efforts, and that the same remaining unnoticed may do injustice to others of this class of gentry, I deem it desirable to say that Mr. T. D. Gladstone, of Boonton, N. J., known as the successful breaker of gun-shy dogs, has for a number of years past adopted this same method of taking his dogs into game countries for more thorough and complete instruction, and frequently at very considerable expense.

Early in the fall of 1874 he took all of the dogs under his charge (one of my own among the number) to Iowa, remaining there, as is his custom in such places, as long as the season will permit of shooting. In the fall of '75 he took his dogs to Delaware and Maryland. In 1876 he went to Virginia with fourteen dogs, remaining there until spring. At the present moment this same gentleman is in Illinois with only four dogs, one each of Messrs. Charles and Jerminal, of Albany, and the red Irish setter Guy, by Rufus, the property of the Westminster Kennel Club, and a dog of the writer, intending to remain until the season closes for shooting. You will observe, therefore, that Mr. G. is another exception to the general rule, and also worthy of similar commendation for the efforts put forth to produce results so desirable to the sporting community. Yours, etc., JERSEY.

[Mr. Demarest will please accept our thanks for the information given, which we publish with pleasure.—Ed. F. & S.]

POSE IN POINTING.—Editor *Forest and Stream*—Permit me to inquire if there are any "right-handed" dogs? Does a dog ever raise his right foot when he stands on a point? If not, why not?

CURACOA.

Class 20.—Fox Hounds—For the best couple, \$25; for the second best couple, \$10.

Class 21.—Beagles, Dogs and Bitches—For the best dog, \$20; for the second best dog, \$10; for the best bitch, \$20; for the second best bitch, \$10.

Class 22.—Dobermans, Dogs or Bitches—For the best dog or bitch, \$20; for the second best dog or bitch, \$10.

Class 23.—English Greyhounds, Dogs or Bitches—For the best dog or bitch, \$20; for the second best dog or bitch, \$10.

Class 24.—Scottish Deer Hounds, Dogs or Bitches—For the best dog or bitch, \$20; for the second best dog or bitch, \$10.

Class 25.—Terriers, Dogs and Bitches—For the best dog, \$20; for the second best dog, \$10; for the best bitch, \$20; for the second best bitch, \$10.

Class 26.—English Setters—For the best dog, imported or native to be shown with not less than two of his get, \$35; for the best bitch, imported or native, to be shown with not less than two of her progeny, \$25.

Class 27.—Irish Setters—For the best dog, imported or native, to be shown with not less than two of his get, \$35; for the best bitch, imported or native, to be shown with not less than two of her progeny, \$25.

Class 28.—Gordon Black-and-Tan or Black, White and Tan Setters—For the best dog, imported or native, to be shown with not less than two of his get, \$25; for the best bitch, imported or native to be shown with not less than two of her progeny, \$25.

Class 29.—Pointers—For the best dog, imported or native, to be shown with not less than two of his get, \$25; for the best bitch, imported or native, to be shown with not less than two of her progeny, \$25.

Class 30.—English Setters—For the best kennel, imported or native, to consist of not less than five, and to be owned by the exhibitor, \$100.

Class 31.—Irish Setters—For the best kennel, imported or native, to consist of not less than five, and to be owned by the exhibitor, \$100.

Class 32.—Gordon, or Black and Tan, or Black White and Tan Setters—For the best kennel, imported or native, to consist of not less than five, and to be owned by the exhibitor, \$100.

Class 33.—Pointers—For the best kennel, imported or native, to consist of not less than five, and to be owned by the exhibitor, \$100.

Class 34.—Black-and-Tan Terriers (large size), Dogs or Bitches, exceeding 13 lbs.—For the best dog or bitch, \$10; for the second best dog or bitch, \$5.

Class 44.—Black-and-Tan Terriers (small size), Dogs or Bitches, not exceeding 13 pounds.—For the best dog or bitch, \$10; for the second best dog or bitch, \$5.

Class 45.—Skeje Terriers, Dogs or Bitches—For the best dog or bitch, \$15; second best, dog or bitch, \$10.

Class 46.—Yorkshire Terriers, Dogs or Bitches—For the best dog or bitch, \$15; for the second best dog or bitch, \$10.

Class 47.—Dandie Dinmont Terriers, Dogs or Bitches—For the best dog or bitch, \$10; for the second best dog or bitch, \$5.

Class 48.—Scottish Terriers, Dogs or Bitches—For the best dog or bitch, \$15; for the second best dog or bitch, \$10.

Class 49.—Long Hair or Silk Hair Terriers, Dogs or Bitches, not exceeding 5 pounds.—For the best dog or bitch, \$15; for the second best dog or bitch, \$10.

Class 50.—Pugs, Dogs or Bitches—For the best dog or bitch, \$10; for the second best dog or bitch, \$5.

Class 51.—Italian Greyhounds, Dogs or Bitches—For the best dog or bitch, \$10; for the second best dog or bitch, \$5.

Class 52.—For the Largest Dog exhibited, \$10.

Class 53.—For the Smallest Dog exhibited, \$10.

Class 55.—Miscellaneous, Dogs or Bitches—For the best dog or bitch, \$10; for the second best dog or bitch, \$5.

DIVISION II.—DOGS NOT USED IN FIELD SPORTS.

Class 54.—Mastiffs, Dogs or Bitches—For the best dog or bitch, \$20; for the second best dog or bitch, \$10.

Class 55.—St. Barnards, Dogs or Bitches—For the best dog or bitch, \$20; for the second best dog or bitch, \$10.

Class 56.—Newfoundlands, Dogs or Bitches—For the best dog or bitch, \$20; for the second best dog or bitch, \$10.

Class 57.—Shepherd, or Colley Dogs, (rough), Dogs or Bitches—For the best dog or bitch, \$20; for the second best dog or bitch, \$20.

Class 58.—Shepherd, or Colley Dogs, (smooth) Dogs or Bitches—For the best dog or bitch, \$20; for the second best dog or bitch, \$10.

Class 59.—Dalmations, dogs or bitches—For the best dog or bitch, \$10; for the second best dog or bitch, \$5.

Class 60.—Bull Dogs, Dogs or bitches—For the best dog or bitch, \$10; for the second best dog or bitch, \$5.

Class 61.—Bull Terrier (large size), Dogs or Bitches, exceeding 20 pounds, bitches exceeding 16 pounds.—For the best dog or bitch, \$10; for the second best dog or bitch, \$5.

Class 62.—Bull Terriers (small size), Dogs or Bitches, dogs not exceeding 20 pounds, bitches not exceeding 16 pounds.—For the best dog or bitch, \$10; for the second best dog or bitch, \$5.

HINTS ON DOG BREAKING.

TO become a good dog trainer a man must be at all times and under all circumstances cool and collected. No passionate man need ever lay the flattering unction to his soul that he is capable of giving a puppy a polite field education. A man to make a good trainer should have a firm nature, giving his *protege* at once confidence, affection and implicit obedience. He should also have an abiding faith in his success. Should I fail to-day I will succeed to-morrow. Don't get fretted; you must have a miserable cur if he can't tell when you are mad. If you do not possess these qualifications and your means are adequate, take my advice and send your puppy to a first-class breaker. Those who have not the means and opportunity to give their puppies to a breaker will allow me in a spirit of meekness to extend to them my experience and observations:

First, get you a well-bred puppy, for blood will tell on some part of the course. Nothing, not even the finest training, can ever compensate for bad blood. If possible have an old and well-trained dog to break your puppies with. Never teach him anything you do not think will be of value to him on the field. Talk as little as possible to your dog; teach him to do your bidding by the motion of your hand. Never teach your dog anything by word that you can teach him by signs. In teaching your puppy to "down" never tell your puppy to "charge" or "down charge." No man ever attempted a greater nuisance with a decent dog. Any dog of moderate intelligence know that in the ordinary parlance of life, "charge" does not mean lie down. Tell him to "down" and motion him down with your hand, and make him down. In a few days he will understand you; then from that day thenceforth and forever motion him down and make him obey you. When you have taught your puppy to down, your next and very important lesson is to teach him to flush his game when commanded. My first lessons in this respect are given puppies over their feed. Make your puppy down by a simple motion of the hand, and when down make him remain until you tell him to "Go," a short and simple word, and one easily carried by a dog, especially when food is the incentive to action. The first time he makes game allow him to stand, say ten or fifteen minutes, then tell him to "Go"—and you

## Sea and River Fishing.

## FISH IN SEASON IN NOVEMBER.

Black Bass, *Micropterus salmoides*; Weakfish, *Cynoscion regalis*, *M. nigricans*.  
 Mascalonge, *Esox nobilior*, Pike or Pickerel, *Esox lucius*.  
 Yellow Perch, *Perca flavescens*.  
 Sea Bass, *Scombrocephalus*, Striped Bass, *Morone tenebrosa*.  
 White Perch, *Morone americana*.  
 Weakfish, *Cynoscion regalis*.  
 Bluefish, *Pomatomus saltatrix*.  
 Spanish Mackerel, *Cybinus maculatus*.  
 Cero, *Cybinus regalis*.  
 Bonito, *Sarda pelamys*.  
 Kingfish, *Monticivus nebulosa*.

**FISH IN MARKET.**—Fish is scarce, but the prices are not high. Poultry and game are cheap, and the demand for fish therefore is slight. Our quotations for the week are:—Bass, 20 to 25 cents; smelts, 25 cents; bluefish, 15 cents; salmon frozen, 35 cents; mackerel, 15 to 25 cents; white perch, 15 cents; Spanish mackerel, 35 cents; green turtle, 18 cents; terrapin, \$10 to \$35 per dozen; frost fish, 8 cents; halibut, 18 cents; haddock, 8 cents; kingfish, 25 cents; codfish, 10 cents; pollock, 6 cents; blackfish, 15 cents; flounders, 12 cents; eels, 18 cents; sea bass, 20 cents; lobsters, 10 to 12 cents; sheephead, 25 cents; English turbot, 40 cents; scollups, \$1 per gallon; soft clams, 30 to 60 cents per hundred; whitefish, 12½ cents; salmon trout, 18 cents; pickerel, 15 cents; sunfish, 10 cents; yellow perch, 10 cents; plain bass, 15 cents; hard crabs, \$2 per hundred.

**MORE SHAD.**—On last Thursday, November 23, three shad males were caught off West Hampton, L. I. We recorded the week before last the catching of a fine female shad.

**ABUNDANCE OF COD.**—The last week has been a remarkable one for the quantity of cod caught off the Jersey coast and Long Island. The presence of the cod is due to the abundance of squid. Usually squid in our vicinity are rare, but this fall they have been found in great numbers.

**HOW THE FISH ARE CAUGHT.**—We have been asked to tell the methods used in capturing fish exposed in our markets, of which we give the weekly prices. We may state that, with but few exceptions, all the fish brought for market are netted. Of course some few are caught by lines, as the cod and halibut, but even the former are now being netted. Catching fish with a hook for market is too slow a process. In looking over back files of the paper, the methods of catching all known fish have been detailed. Bass are mostly caught in nets, few by lines; so are smelts, blue fish, salmon, mackerel, shad, perch, and turtle. Halibut are caught with lines. Codfish are mostly caught by lines, but lately with nets, some of those which were last week in market having been caught in nets off New Jersey. In Norway cod are netted sometimes, and even in the waters which border on the Canadian provinces. Pollock are caught with a line, as are haddock. Herring are netted; lobsters are caught in a pot; sheephead are almost always caught with a line, though some are netted; soft clams are dug for; terrapins are netted, and so are crabs; whitefish are netted. We use sometimes the expression of "Count" to terrapins. A count is only the title of nobility to a terrapin that will measure six inches.

**MOVEMENTS OF THE FISHING FLEET.**—The number of fishing arrivals reported at this port the past week has been 34, viz., 8 from the Banks, 16 from Georges, 2 from the Bay of St. Lawrence, and 8 from Shore mackereling fleet. The receipts have been 60,000 lbs. bank codfish, 320,000 lbs. Georges codfish, 60,000 lbs. halibut, 370 bbls. Bay mackerel, and 150 bbls. Shore mackerel. The mackerel season is substantially closed, with a small stock in the market and firm prices. Georges and Bank Codfish are in small stock, and prices are well maintained.

**LONG ISLAND TERRAPINS.**—It is only of late that the excellence of the Long Island terrapins has been determined. Those familiar with the many varieties of terrapins to-day give a decided preference to the terrapin coming from our immediate vicinity, to those found on the Chesapeake. Possibly the reason why the Long Island terrapin was not appreciated was that they came to market in small quantities. Lately, however, their excellence having been determined, greater efforts have been made to find them, and they are in constant demand. This terrapin is found in Large Harbor from about the 1st of May to the close of August. They are mostly caught in fykes, with hedging of thirty feet wing. Smithtown, Stratford River, are also good places for terrapin. Some few are caught at Roslin and Glen Cove. About twenty terrapin at a catch is thought a very fine take. Such terrapins as are caught in the summer are placed in a stacked crawl, to be sold in the winter. While preparing for the market the terrapins are fed on fiddlers, sometimes with Indian meal. Mostly these terrapins are of good size, and would class with what are called "counts," a count being a terrapin six inches or over. This season some 800 have been caught, which is a larger quantity than in any former years. In price they command even a higher price than the Maryland terrapins. We only give these facts, because in an article in a late number of *Scribner's Magazine* on terrapins, the existence of the Long Island terrapin was ignored.

**BASS FLIES FOR USE IN FLORIDA WATERS.**—We are indebted to Wakeman Holberton, of the Sportsmen's Emporium, 102 Nassau street, for some fine patterns of bass flies intended for use in Florida waters and those of other Southern States. The specimens before us have been proved killing flies. The fly fishing there last season was very fine, as there are a number of fish besides the bass that take the fly and give great sport. Gentlemen intending to visit Florida will do well to inspect Mr. Holberton's stock.

## TIMES AND SEASONS FOR FISHING.

EDITOR FOREST AND STREAM:

I have entertained the idea of your correspondent "Splasher" for some time, and have talked it over with my brethren of the rod for a good while. I would suggest that there be added to the conditions he mentions as requisite to success in catching black bass, the locality, as this has probably as much to do with regard to kinds of bait as nearly all else. Take for instance the mode of fishing for them as practiced on the

land-locked lakes and ponds of Florida. The angler sits in the bow of the boat furnished with a stiff pole, to which is attached a spoon gear with about two feet of line; he "swish-swashes" the spoon back and forth six or eight feet on the surface of the water, and instead of securing every fish in the pond actually catches many black bass.

No one in this locality (Eastern Connecticut), has to my knowledge taken a bass with a spoon, but the following kinds of bait have been used, viz., grasshoppers, crickets, small frogs, hellgramites, slugs, angle worms and shrimps. The best success, so far as I can learn by my own and others experience, have been with crickets, although more or less have been caught with each of the above mentioned baits.

I have noticed that at times when the best success is had with bass; the stomachs of the fish are almost invariably well filled, which leads me to advance the theory that fishes of prey are not unlike beasts and birds of prey, inasmuch as when they do feed they gorge themselves, and then "lay off" to digest their food, during which time they are not so liable to bite.

I have noticed the same with regard to trout and pickerel.

O'VERCAST.

**FISH OF VANCOUVER'S ISLAND.**—The natives have a peculiar mode of catching a small fish which resembles a herring, but is inferior to it in size. Taking a lath-like stick of tough wood, the edge of the end not handled being armed for several feet with thin iron spikes, they proceed slowly in search of their prey, using their implement like a paddle, and darting it rapidly through the funny droves. By this maneuver a dozen or two are frequently impaled at a stroke, and adroitly transferred to the canoe to be used as bait. Herring and herring-spawn are largely eaten, both fresh and dried, the spawn being obtained by placing fir branches in the quiet bays which the herrings frequent. As soon as the branches are covered, the spawn is collected and dried in the sun. Halibut and rock cod are also caught in these waters. Among shellfish may be mentioned a poor apology for the oyster, which seldom attains a diameter exceeding an inch. Its near neighbor, the clam, atones for this deficiency, and is frequently got up ward of a pound in weight. Very dear to the heart of Siwash is this mud-loving crustacean, which plays an active part in rustic repasts. The bivalve is often smoked, dried and put on long skewers; and together with dried salmon, forms an unflinching adjunct to the Indian cuisine. Besides the oyster and clam, the mussel, razorfish, cockle, and a few others are found on these coasts. —*J. Mortimer Murphy in Chambers Journal.*

## Answers to Correspondents.

## No Notice Taken of Anonymous Communications.

A number of anonymous correspondents will understand why their queries are not answered, when they read the lines at the head of this column.

J. H. W., Rosedale, Kansas.—Probably you feed too much meat for so young a dog.

A. B. V., Vinal Haven.—Do you know of a gunmaker in London named M—? Ans. We do not.

C. W., New York.—Did Gildersleeve and Bodine shoot in the International match of 1876? Ans. They did.

J. M. D., Irwin Station, Pa.—You should not hunt your dog when he is lame. Give him rest and a warm, dry bed.

F. O. B., Houston.—Where can I get Col. Hutchinson's work on breaking dogs, and price? Ans. We can supply it. Price \$3.

H. J. J., New York.—Have a B— gun, 7 pounds 12 gauge. Please give me proper load. Ans. 3½ drs. powder and 1 to 1½ oz. shot.

SAM.—We have never heard of so large a catfish being caught with a line as that recently mentioned by the Paducah (Ky.) News, which weighed 111 pounds.

J. A. D., Boston.—In your last issue you advised me to keep my dog chained at night and loose by day, will this affect him in regard to watching? Ans. It will make him a better and more intelligent watchdog.

ANON, Phila.—In your paper of Nov. 5th you say Bogardus will shoot 5,000 balls in 5,000 minutes, or in 8 hours and 20 minutes. You should say 500 minutes. 5,000 minutes would be 83 hours, would it not? Ans. you are right.

J. E. P., Buffalo, N. Y.—What will remove warts from my red Irish's fore legs? He has one on each leg. Ans. Canstic potash is the best application. Moisten the wart and then apply a little of the potash, or use chromic acid, 10 grains, and distilled water, 10 to 20 grains.

TANTRAMER, St. John, N. B.—Who publishes lithographs of snipe and woodcock in New York? They are companion pictures, and what is the price? Ans. Robt. S. Newell, Buffalo, N. Y.; price, \$5. Very excellent pictures for studio, library and dining-room.

F. W. K.—The Fish Commissioners of your State are J. R. Shotwell, of Rahway, and G. A. Anderson, of Trenton. Better address the latter in regard to stocking your ponds. Trout might thrive in the large clear pond, and bass certainly would. The small muddy ones are fit only for gold fish, which you can buy from the dealers.

CHOKER BORE, New York.—1. Can buckshot be fired from a moderately choke-bored gun without injuring the barrels? 2. Is there any American powder made that is as clean as Curtis & Harvey's? 3. What do you know of the Dittmar powder? Ans. 1. Yes. 2. Yes. Hazard, Electric and Ladin & Rand No. 7. 3. It is favorably regarded.

W. K., Cambridge, Mass.—Can you tell me anything of the comparative merits of the "Grave's Arrowhead Boat" and the "Rushion Portable"? I think the chief difference, after the model, is that Graves uses bass wood and Rushion cedar. Ans. Both boats are in our opinion equally meritorious. Rushion builds of cedar. He makes a specialty of light boats.

F. A. S., Macon, Mo.—I have bought a W. and O. Scott & Sons breech-loading shot-gun, 10 bore, 6 pounds, 30 in barrel. The bore is the same size all the way except just at muzzle which is contracted a little. Is that considered as good a way to choke bore as to enlarge the bore just inside of the muzzle? and will it shoot as hard? Ans. Yes, the hardest shooting guns are choked in that way.

WOODEN NUTMEG, Iowa.—Can the Editor or some reader of FOREST AND STREAM, who has had experience in this matter, give us some information in regard to their success in wintering quail shut up in some building to save them from being killed off by snow and cold. I would like to try to preserve some if I knew how it would result. Ans. For full particulars see illustrated article in Vol. 3 No. 22.

C. S. S., Fairport.—Please state in your next issue how I can rid my setter pup of lice? His neck is fairly covered. Ans. Anoint with mercurial ointment, muzzling the dog so that he cannot lick the parts anointed. Wash off with warm water afterward. Or apply the pyrethrum roseum, or Persian insect powder, to be bought of druggists; or use soft soap with the addition of a few drops of liquefied thymol.

J. C. H., Address Thompson & Tagg, New Hope, Bucks Co., P. A. You do not comply with our rule by giving your address, else we could have mailed you remedy on the day your inquiry was received.

BROOK TROUT, New York.—Do you think it would be practicable to raise brook trout from the egg, somewhat after the principle that Mr. Blackford, of Fulton Market, is raising young California salmon, in an aquarium? and could you tell me the price I would have to pay for eggs? Ans. It is quite practicable. You will see the hatching in successful operation at the New York Aquarium as well as at Blackford's. Price per 1,000 about \$5.

X. Y., Arlington, N. J.—We are much troubled by usual sportsmen who are often evidently gentlemen, killing our tame squirrels while we are very pretty to see running about the lawns. What remedy have we? Do squirrels do any harm? Ans. Post your ground and arrest for trespass, or keep a man to watch. Squirrels devour the young and eggs of birds, eat young fruit trees and do other damage. A colony of squirrels will thin out your birds, if you have any, in a short time.

B. E. F., Harrisburg.—The tips and edges of my little Gyp's ears have become inflamed and broken out in sores full of matter. She shakes her head some. Is fed from offal of table (mostly meat), has extra appetite, her eyes are clear, but her coat is dead. Will you please give me remedy for her? Ans. Your dog probably has "crank of the ear." Stop feeding meat. Keep the ears clean and give plenty of exercise. If this does not cure consult Hallock's "Gazetteer" for further treatment.

L. R., Troy, N. Y.—I have a setter pup six weeks old. Sent the old dog away two weeks ago. I am feeding him on milk and a few mashed potatoes occasionally. Eats well, but has small sores; one on his side and one on the tip of the ear. Many advise me to cut off a piece of the tail. What kind of soap to use in washing him? Ans. Leave the tail alone. Should be careful about washing so young a pup. Give him a comfortable dry bed and he will keep himself clean. Juniper tar soap is about the best.

H. V. W. M., Newark, N. J.—Will you please give the readers of your valuable paper your opinion on the catamaran or drying proa? Is it a success as a small sail-boat, say about 25 feet in length? Is it safe and handy in rough water, and how rigged? Ans. For full description see our yachting columns. From our limited experience we were not prepared for the assertion of Mr. Herreshoff that the catamaran is as good on the wind as many other craft. With the wind free they are very fast. It is safer than ordinary boats.

J. H. C., Boston.—I want to find out what sizes, from largest buck to No. 1 shot, will make best targets in my gun? 1. Will loading with one drachm powder and one layer shot give as good proportionate target as regular charge? 2. What would be best size to shoot at? 3. Commencing with largest buck to what size shot would you chamber in muzzle of gun? Ans. These are difficult questions to answer. Send us the gauge of your gun and we will answer intelligently. Forty yards is the regulation distance for patterns.

O. H. J., Washington, D. C.—Please inform me where I could purchase a wild turkey call? Ans. Make one yourself. Make a little box of Spanish cedar 3½ inches long, ¼ to ¾ deep and 1 inch wide. Cut a piece of smooth stave that will lie nicely in the bottom of the box; have the top smooth and even. Make the box without glue; put it together with brass pins. To operate this hold the slide between the thumb and middle finger of the right hand while the call is held by the thumb and middle finger of the left. See Hallock's "Gazetteer."

S. G. R., Rochester.—1. Do you prefer an English to an American gun? 2. Is Caribbrough, an English gun, considered reliable? 3. About how many shells should I take to the North Woods, staying a month. 4. Is it cheaper to use brass or paper shells. 5. What kind of gloves are best to hunt with? Ans. 1. We prefer some English guns to some American guns. 2. As reliable as any gun made. 3. It would be difficult to tell; say 200. 4. Brass. 5. Regular sportsman's mitten with one finger and thumb clear. They are new in the market, and the best of anything we have seen. You can buy them of Schnyler, Hartley & Graham, 19 Maiden Lane.

M. H. C., Morris, Ills.—Please answer where J. D. Caton's book on Antelope and Deer of America can be got and price? Also, in scoring line shots at Creedmoor is the centre or circumference of the ball scored to the highest number? Also, how many grains is called an ounce of shot? Ans. 1. Can be bought of Wiley & Sons, 15 Astor Place, New York. 2. The circumference of the ball counts. 3. You will find the men scarce who know.

DUCKIST, Cleveland, O.—Where can we purchase or obtain roots or seeds of wild celery, and mode of planting or propagation? Ans. Wild Celery, Elv Grass and Tape Grass are different names for the *Valisneria spiralis*, a rather common water plant which is most easily propagated by divisions of the root-stock. If planted in the mud in shallow water, it would soon be at home and spread amazingly. It is a stemless plant with bright green, ribbon-like linear leaves, and grows entirely under water. It is one of the most singular and interesting of plants, the fertile flowers rising to the surface of the water on thin stems, escape two to four feet long according to the depth of water; while the staminate clusters being confined to the bottom by the shortness of their stamens, the flower buds themselves break away and floating on the surface of the water fertilize the flowers, which then coil up spirally, drawing the fruit under water to ripen. It is an excellent plant to use under the microscope to show the circulation of the sap, and is much used as an aquarium plant, and sold at from five to ten cents each; but doubtless many of our Maryland subscribers would gladly send you enough to make a small plantation for a start.

J. C. H., New York.—1. My gun, 7½ pounds, scatters shot very much. Have been using Ely's best green shells, 3 drs. powder, 2 plink edge wads on powder, 1 oz. shot and thin wad on top of shot. Can you suggest a better way of loading? 2. How does Joseph Dexter rank among London gun makers? Ans. We do not advise the re-boring of breech-loading guns, owing to the better class of English makers targeting their guns before leaving the factory. If such a gun should fail to shoot it may be attributed to the fault of the man behind the gun. From your inquiry it is very evident that you are not using the proper charge. To insure good shooting you should experiment with the gun until you find the charge of powder and shot required to do the execution you wish to do—either for birds, ducks or geese. The first object in view should be penetration, which is ascertained by increasing the powder; second, the quantity and size of shot. Because your friend uses 3 drs. of powder, and 1 oz. No. 8 shot, proves no reason why your gun should target well with same charge. Your gun may do better execution with less powder and No. 9 shot, which would be an advantage, owing to the greater number of pellets. The scattering of the shot depends upon the distance the gun has been fired. The best guns that are made are only warranted at 40 yards—that is at 40 yards the shot should be so evenly distributed from the centre of a 50 inch target, that I would be almost impossible for a bird to pass through without being hit. Guns are known to kill at a much greater distance if held upon the object. The sportsman should bear in mind that it is the powder that does the killing and not the shot. We hope that our correspondent may succeed in finding the proper charge—for his Joseph Dexter I well made gun.

POTNAM, Conn., Nov. 19, 1877.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INSTRUCTION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

**Forest and Stream Publishing Company.**

—AT—

No. 111 (old No. 103) FULTON STREET, NEW YORK.

[POST OFFICE BOX 233.]

TERMS, FOUR DOLLARS A YEAR, STRICTLY IN ADVANCE.

Twenty-five per cent. off for Clubs of Three or more.

#### Advertising Rates.

Inside pages, nonpareil type, 25 cents per line; outside page, 40 cents. Special rates for three, six and twelve months. Notices in editorial columns, 50 cents per line.

Advertisements should be sent in by Saturday of each week, if possible.

All transient advertisements must be accompanied with the money or they will not be inserted.

No advertisement or business notice of an immoral character will be received on any terms.

\* Any publisher inserting our prospectus as above one time, with brief editorial notice calling attention thereto, and sending marked copy to us, will receive the FOREST AND STREAM for one year.

NEW YORK, THURSDAY, NOVEMBER 29, 1877.

### To Correspondents.

All communications whatever, intended for publication, must be accompanied with real name of the writer as a guaranty of good faith, and be addressed to the FOREST AND STREAM PUBLISHING COMPANY. Names will not be published if objection be made. No anonymous contributions will be regarded.

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions.

Nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for dereliction of the mail service if money remitted to us is lost. NO PERSON WHATSOEVER is authorized to collect money for us unless he can show authentic credentials from one of the undersigned. We have no Philadelphia agent.

Trade supplied by American News Company.

### THANKSGIVING.

AS wanes the year, and days grow short and shorter, and great gales at sea proclaim the advent of blustering winter, there comes a time of peace and rest, at least for men's hearts and souls, and so may the turmoil of the elements be forgotten. Some little moral one usually looks for at this season of Thanksgiving. To all our kind friends we wish happiness and good cheer on this occasion. But above all, charity. And those who, with gleeful hearts, visit once more the homes of their childhood, and around the ruddy hearth grasp again the hands of fathers and mothers, let them remember those who have no homes, and, by good words and actions, give to such not so blessed a title of what they have. Then will Thanksgiving not only be remembered for the comforts the body may receive, but the heart be rejoiced, for the consciousness of having performed some slight act of true grace "delighteth forever."

A DIVIDED JUDGMENT ON THE FISHERY QUESTION.—The question of the differences between the Commissioners representing the interests of the United States and the Dominion, on the fishery question, has resulted, in the opinion of two of the judges, that the United States are to pay \$5,500,000. The arbitrators were Sir A. T. Galt for Canada, Judge Kellogg for the United States, with M. Delfosse, the Belgian Minister at Washington, as President. The decision was not unanimous, Judge Kellogg dissenting. As it is with this judgment, if it be carried out, it will not give much satisfaction to either party. The Canadians are said to have been asking for ten millions of dollars, while the United States thought a few hundred thousands would do. Recalling the subject to our readers, they may remember that General Grant, in 1870, called attention to the fact of certain unfriendly proceedings of the Canadian authorities. The great difficulty in a discussion of this character, we suppose, was to get at anything like the quantity or direct value of the fish caught, or to make a balance between a debit and credit account.

We have been waiting for sometime to have this judgment which grew out of the High Joint Commission. If we remember rightly, it was understood that an unanimous decision of the arbitrators would be necessary in order to be binding.

### OUR CENTENNIAL AWARD.

WHEN space was allotted to the army of exhibitors at the great Centennial Exposition in Philadelphia, we applied for and secured an area of 1,200 superficial feet, where in we proposed to display all the apparatus and paraphernalia in use by sportsmen and professional fishermen and hunters, including guns, ammunition, nets, boats, clothing, fishing tackle, etc. When we had already made great progress in the collection of the materials, one of our friends alone, Mr. John A. Nichols, of Syracuse, having contributed about \$5,000 in value, we were induced to unite our efforts with those of the Smithsonian Institution, and to merge our small collection into their larger one, the Institution at Washington having already on hand within its walls a vast quantity of material applicable to it, and greater facilities than ours for adding to and making the collection complete. Of course any direct credit or *clat* that FOREST AND STREAM as an individual exhibitor, could secure was lost to it for the time being. So also, as to the efforts of Prof. Baird and others, who were foremost in the enterprise. The exhibit appeared simply as a Government exhibit, a great portion of which it was understood was to be permanent at the Smithsonian buildings in Washington, after the Centennial affair was over. Visitors will undoubtedly recall it to mind, occupying as it did one entire angle of the great building.

Besides our indoor collection, we had erected a complete Hunter's Camp upon a picturesque spot on the grounds which was kindly allotted to us by the Centennial Commission, in which other devices and appliances of the old time hunter were more practically shown. This old log cabin attracted a great deal of attention, and thousands of names of visitors were placed upon its register. It was subsequently donated to the Fairmount Park by the proprietors of FOREST AND STREAM, and became one of the fixtures of the park.

Well, we were about to say—that although our unique and acceptable contributors received no official recognition at the time of exhibition, they have nevertheless not been forgotten and we have now received not only a diploma from the Commission, but a bronze medal as awards for our efforts. We are proud of these and shall carefully cherish them as souvenirs of the occasion. Below we append a faithful transcript of the medal, and a copy of the inscription of the diploma:

INTERNATIONAL EXHIBITION,  
1876.  
CERTIFICATE OF AWARD.  
FOREST AND STREAM PUBLISHING COMPANY, NEW YORK.  
COLLECTIVE EXHIBIT OF FISHING AND HUNTING IMPLEMENTS.  
No. 12—Group XXIII.

UNITED STATES CENTENNIAL COMMISSION,

In accordance with the Act of Congress, Philadelphia, Sept. 27, 1876.

[L. S.] JOHN L. CAMPBELL, Secretary. A. F. GOSHORN, Director General. JAS. R. HAWLEY, President.

FOR TOURIST'S REGISTER.—We have received the following applications:

PHILADELPHIA.  
*Gentlemen:* A mineralogist proposes to go to Sanford, on Lake Monroe, Fla., about the middle of January, and would like to join a party of not more than six to charter a boat for a sporting trip. Unexceptional references given and required.

STEPHEN'S PATENT COMBINATION RULE.—This is no gimcrack tool. Messrs. Stephens & Co. are known all over the country as manufacturers of the standard rules. This peculiar tool combines within itself a carpenter's rule, a spirit level, square, plumb, bevel, indicator, brass scale, draughting scale, T square, protractor, right angle triangle, and with a straight edge it can be used as a parallel ruler. Rifleman will find this rule invaluable, as by its use elevations can be studied and absolutely noted. A great many of our leading riflemen use this rule with its spirit level in studying the capabilities of their arms. To the surveyor this rule is perfectly adapted to the laying of angles. Lumbermen by its use can determine in the woods the height of trees and determine how much clear timber a tree will furnish. This rule is well and solidly made, and we can recommend it every way. The manufacturers are Messrs. Stephens & Co., of Riverton, Conn.

HENRY WATTERSON.—A large audience, comprising many of New York's most prominent citizens and *litterateurs*, gathered in Chickering Hall one evening last week to listen to a brilliant lecture by the well-known editor of the Louisville *Courier-Journal*. The speaker's theme was the "Comicalities of Southern Life," an able portrayal of Southern humor. Mr. Watterson found also opportunity for many serious and thoughtful words of deeper import.

PERSONAL.—We have received a visit from Edward Hodder, Esq., a gentleman well known for his prowess with the rod and gun. Mr. Hodder, who is now returning to his home in Ireland, is familiar with the game of our country, having spent several years in the Territories. Mr. Hodder informs us of good sport on the St. Clair's flats, having in three weeks killed some 100 ducks, 200 quail, 85 partridges, beside woodcock and snipe. He reports the ducks in good quantity. In Ireland Mr. Hodder, in company with Mr. Sandford, of the *Cork Constitution*, fish in the Blackwater, having leased a portion of this river. Though the salmon do not run as large in the Blackwater as in the Shannon, the fish are very fine. Mr. Hodder has very kindly promised to give us some accounts of his fishing and shooting in Ireland, which will doubtless be interesting to our readers.

NATURE'S WEAR AND TEAR.—We have the information that more of the Niagara rock fell last week, changing the shape of the Horseshoe Fall, to a right angle, so that the well-known symmetrical curve, with its brilliant emerald hues, which has furnished so many studies for the artist, no longer exists except on historical canvas. The rocks in the centre and sides have been crumbling away from year to year so rapidly that even within the memory of the present generation the entire contour of the falls has been changed, especially in the centre and on the Canadian side. Table Rock and the ledge on which the old tower stood are no more. The actual recession of the cliff or ledge over which the great sheet of water falls amounts to several rods; and it does not therefore require much geological research or mathematical figuring to determine at what remote period the emerald curtain which Goat Island now divides fell into Lake Ontario in one great unbroken sheet at the mouth of what is now the Niagara river.

St. AUGUSTINE TALENCE TO NASSAU.—We would call attention to the departure of the fine steamer San Jacinto, which will leave Pier 10, East River, on December 8, for St. Augustine, Florida, thence for Nassau on the 13th. The accommodations on this line are unsurpassed, and this route affords an excellent opportunity to reach all points on the St. John's River. The agents, Messrs. Murray Ferris & Co., No. 68 South street, will give full information on all subjects interesting to tourists, sportsmen and invalids. Nassau is considered a very healthy winter resort, and is much sought by invalids with bronchial troubles.

—The Mayor, President of the Board of Health and City Physician of Jacksonville announce that there is now no yellow fever or other contagious disease in that city or vicinity, nor has there been for two weeks.

—Professor E. S. Morse, of Salem, Mass., the distinguished naturalist, brings back from Japan many remarkable results of his scientific investigations, both in embryology and in the examination of ancient mounds revealing traces of prehistoric human life.

## VACATION RAMBLES IN MICHIGAN, WISCONSIN AND MINNESOTA.—No. 7.

BY THE EDITOR.

NOVEMBER 20, 1877.

BRETHREN: Because to-day is appointed Thanksgiving it is no proof that Turkey is to be taken. Were I in Florida, in the hammock back of Enterprise, about daylight in the morning, my gun might offer more positive testimony, and a full report thereof follow in the columns of FOREST AND STREAM. But my story is now of Michigan, and I therefore continue it from where I dropped it last week.

Let me see: we had visited Pine Lake and its adjacent waters, which we reached by a channel communicating with Lake Michigan at Charlevoix. In outlining the fluvial geography of the northern part of the State, I have been particular to show that it embraces an interior system of lakes and rivers, large and small, divided into separate groups or chains, each having its outlet into Lake Huron or Michigan. From those large bodies of water the interior system is separated by a narrow, circumscribing strip of high land. It is in reality a great basin in which, if full, the crests of the dividing ridges that separate the chains of lakes would appear as islands. This basin we would enter by the inlets so often referred to, one of which is at Cheboygan, another at Petoskey, a third at Charlevoix, a fourth at Torch Lake, and a fifth at Elk Rapids. The outside steamer makes the grand circuit of the Michigan peninsula and touches at each of these points connecting there with the smaller inland steamers. The first three we have visited. We are now supposed to be on board of the Van Raalte again, en route for the fourth at Torch Lake. The voyage offers no features of especial interest to the tourist, as most of it is made at a considerable distance from the land. There is no boundary to the seaward side, for the haze that rests on the natural horizon blends the water and sky into one common blue, and the land that is only twenty miles beyond is as invisible and unappreciable as the sidereal worlds which we are told exist in the infinite distances of unmeasured space. We have only the circling gulls to watch, and the listless sails of many three-masted schooners and brigantines drooping in the glassy atmosphere of a dead calm. The sky is hot and coppery, and the motion of the boat affords the only relief to the oppressive heat, which it scarcely modifies. When we reach "The Torch" (as the landing is locally designated) and come to a full stop, the heat is consuming. There is a funnel cut for the passage of a horse railroad track through the sandy ridge which separates the two lakes, and here the solar rays concentrate and broil the unhappy traveler until the atmosphere of Tophet becomes ethereal mildness in comparison. Fortunately the distance is but half a mile, and when one finally reaches the grateful shade of the eastern piazza of the "Lewis House," and gazes out over the spreading lawn upon the unrippled surface of the far reaching lake, he forgets that he ever suffered, and is willing to live on to run the risk of repeated broils hereafter.

The visitor is scarcely prepared for the luxurious civilization which he finds at this popular resort—the sweeping carriage drives, the lawns, the fruit trees, the rookeries and beds of flowers, the detached cottages for guests, the large, well-furnished rooms, the wholesome, abundant table, and the pervading sense of home-life and comfort. The main structure is a large, central edifice, with wings, standing on level ground which slopes to the lake side. From its cupola there is an extended outlook over the lake, which is a beautiful sheet of water eighteen miles long, ranging from two to three in width. Circumvallent hills inclose it; its shore-lines sweep into graceful curves; high points of woodland diversify its contour and hob-nob from opposite sides; its waters are clear as crystal; the stars and fleecy clouds gaze into it, summer zephyrs fan it; festive bass and predacious pike disport therein, and all the elements and nymphs of the water toy with it tenderly as chosen mistress—"Queen of the Lakes." I was told that it contained no fish, but experiment presently revealed a five-pound bass, which came to the minnow of a Louisville friend, whose common sense directed him where to fish. I am amazed at the prevailing ignorance among tourists of the first principles of angling. Rods have they, but they angle not; they have lines and reels, but they retrieve not; they pay the piper but do not dance. I am certain that if amateur fishermen would only study natural objects, and use their judgment in angling as they do in the ordinary pursuits of life, they would have less complaints to make of bad luck, depleted waters and empty creels. Gunners do not hunt ducks on the mountains, or rabbits among the reeds of a marsh; neither do they look for turkeys by the sea-side, or ruffed grouse upon the plains. They shoot not quail with bullets, neither do they hunt antelope with a shotgun, or run buffalo with hounds. Why, then, should they fish for bass and trout in places where they are not, or tempt their fastidious tastes with strange devices which satisfy not? Most fish lie near to shore, because the minnows, small fry, and creatures that inhabit the water congregate there; and, where food is, there do the fish throng. Yet novices generally seek the centres of lakes, where the water is often forty fathoms in depth, and hope for luck in trolling, and success in skittering the spoon and frog. In hottest weather, when fish seek the coolest depths, they must be reached by deep lines and proper methods, which have been repeatedly taught your readers through the columns of FOREST AND STREAM, since the first number of its beginning, and are especially set forth in the "Sportsman's Gazetteer." So, also, in trout

streams, when the speckled denizens gather about the spring-holes, we may hardly expect to tempt them with a fly upon the surface. One may take it for granted that there are fish in all the waters of Michigan that are suitable for their health and growth. Let him put no trust in assurances that fish are not to be caught in this lake or that, but put the question to the proof, *secundum artem*, as my friend Lord, State Military Inspector of Michigan, did in Burt Lake. He quietly tossed over his anchor-stone into a deep channel near the shore, where the weeds grow, and took sixty with minnow! And yet he was told that only pike inhabited Burt Lake.

The Lewis House is generally well patronized, for its reputation is wide. Its guests come chiefly from Kentucky, Indiana, Illinois, Missouri, Ohio and Michigan, as, indeed, do nearly all the visitors to this section. While I was in Michigan, I found only half a dozen Eastern names registered; there was one from Vermont, one from Boston, one from New Jersey, two from New York and two from Pennsylvania. This is the more remarkable, because two-thirds of the population of Michigan are of Eastern origin—chiefly from New York and New England. How much that is beautiful and enjoyable in nature is lost by those who decline to go West for recreation! Those who read my letters shall not plead ignorance hereafter. Very solid and substantial citizens do the Eastern men make who come here to settle: with all their disagreeable points and angles rounded off by contact and attrition with the rougher but more generous Western element; with their narrow local prejudices eliminated, scattered and lost on the unmeasured expanse of a domain so vast that a thousand acres scarcely give the individual settler elbow-room; engraving their fixed principles of social order upon the self-assertion and single-handed independence that has hewed its way through the roughnesses of the frontier; blending the amenities of a ripe civilization with an open generosity that is not measured by the roughness of its garb; tempering prodigality with shrewd business caution—in a word, combining the good qualities of both sections with an advantage that cannot be mistaken or ignored. I would not purposely speak in disparagement of either section, but I am convinced that out of a union of the two stocks is bred a hardier, worthier and better race of men.

When we were ready to leave our hospitable hotel, the fine steamer called the Queen of the Lakes awaited her passengers at the little pier. The water was deep and bold, and we could see the perch and shiners clustering around the piles in swarms. I was surprised to see so large a vessel on inland waters. She is of iron, very commodious, luxuriously equipped, and can carry three or four hundred passengers at least. She is owned by Dexter & Noble, a firm which has a blast furnace, mills and large stores at Elk Rapids, forty miles below. Steaming a few miles down the lake, and crossing to the eastern shore, she touched at a landing known as "Russell's," where a stage is in readiness to convey visitors to the Intermediate Lakes, where there is a rough, but comfortable home known as the "Island Camp." If the tourist desires, he can be dropped at the mouth of Clam Lake, flowing into the east side of Torch Lake. Passing up Clam Lake, he will presently come to a "narrows" leading into Grass Lake, which is joined to Intermediate Lake by Grass River, a stream affording fine fishing. Continuing down Torch Lake to its lower end, our steamer enters Torch River, a crooked stream three miles long, with charming windings through the woods, and thence passes into Round Lake, a body of water about two miles in breadth by four in length. From Round Lake we pass into another connecting channel, called the Narrows, which leads to Elk Lake. Rapid River enters the Narrows about midway, and my comrade and I launched our Bond boat, and ascended it for several miles, taking a fine mess of trout with bait. Deer sign were not only abundant along its shores, but we had the satisfaction of overhauling a goodly buck, which had become mired in crossing the stream from a grassy island, where it had been feeding. A large deposit of weeds and silt, fully three feet in depth, had accumulated along the bank, and locomotion through it was anything but easy. Although we failed in our utmost endeavors to push our boat through this, the deer surmounted it with many a gallant plunge, and escaped to the woods. Meanwhile our loaded Scott gun lay peacefully in the bow, and offered the creature no harm, as the season for shooting was not yet open. At evening a tug took us by appointment down through Elk Lake to Elk Rapids, but not until we had been thoroughly drenched by a passing shower. This shower, though unpleasant to us, was much needed to quench large fires which had got into the timber along the shores of Elk Lake, and also destroyed some orchards and farm buildings. When we passed the scene of conflagration, the red flames were still climbing the tall trunks of the resinous pines, shooting out their hot tongues, and shedding a lurid light upon the water. The outlet of Elk Lake extends for a mile, emptying into Lake Michigan, in what was once a series of rapids; but now flows over a dam which holds the water back for the mills as well as for the purposes of navigation. Bass fishing was formerly very good at the rapids, it is said, but we failed to raise any fish there.

The town of Elk Rapids chiefly occupies a wide avenue along the shore of the lake, and is supported by its blast furnace and mill. There are some brick stores, several fine residences, including those of the brothers Noble, and an excellent hotel kept by the Harsha Brothers. The Messrs. Noble have a steam yacht here which visitors can sometimes obtain, and a few days can be passed very pleasantly.

The day before I left there was a gale which drove the

waves of Lake Michigan against the breakwater with tremendous force. From the windows of my hotel I watched the surf leaping into the air and dashing itself into huge sheets of spray which the wind drove inshore for many a rod. Seaward, as far as the eye could reach, the surface of the lake was churned into foam, and the great billows came careering in one after another, and broke in tremendous surf against the sea wall and over the pier where several large vessels lay moored. Then I could almost realize the fierceness of the November storms which play such havoc with the shipping, and make wrecks of unfortunate vessels driven ashore. At evening the storm abated and the waves calmed down, though the sea still ran high. Then I somewhat wondered to see a fleet of Indian canoes hoist their quilts and blankets for sails and bear away for the head of Grand Traverse Bay, now rising like corks upon the tops of the long swells, and anon sliding down into the hollows with a lurch that threatened to capsize them and spill out their precious loads of squaws, papooses, dogs, pots and garden vegetables with which they were freighted. But no mishap occurred, and these bold sons of the forest proved themselves good navigators. They had just visited Elk Rapids on one of their periodical trips after family supplies.

From Elk Rapids to Traverse City the interest of the journey is well sustained. A glance at a map will show that Grand Traverse Bay is bisected by a narrow peninsula or cape which the steamer has to double. Elk Rapids is on the eastern arm of the bay, and Traverse City on the western. A bee line from one place to the other would be less than one-fourth the distance around. The steamer first crosses the east arm from Elk Rapids to Mission Point, an old French missionary station where some of the finest fruit in Michigan is raised; then runs due north until she reaches the point of the dividing peninsula, which she gives a wide berth; and then changes her course to due south, and—to cut our journey and its story short—finally reaches Traverse City, a place of some 3,000 population and much local business. This, it will be remembered, is the terminus of the branch of the Grand Rapids and Indiana Railroad which diverges from the main line at Walston. Darkness and quiet are upon the town when we arrive. A few glimmering street lamps reveal some substantial blocks of brick stores. Brilliant lights are gleaming from the many windows of a large hotel known as the Campbell House. Our omnibus carries us past all these, and apparently to the outskirts of the town, where we are deposited before a homelike house surrounded by gardens, and embosomed in trees, which we are told is to be our headquarters. This is the Traverse City Hotel, and is kept by Frank Lewis, who is also proprietor of the hotel at Torch Lake which we have recently left. We are made very comfortable for the night, and when we awake in the morning our eyes rest upon the sparkling waters of the Boardman River, which flows before our door. Here the angler ought to be content. I made no stay and can affirm nothing from my own experience. I may, therefore, be pardoned for quoting what our friend Page writes of the attractions of this vicinity:

"In the bay, muskallonge, lake trout, bass, pike and pickerel are very abundant. Cedar Lake three miles, Bass Lake eight miles, Betsie Lake twelve miles, Long Lake six miles, and Traverse Lake ten miles from Traverse City, are especially fine. Perhaps the best fishing with the spoon, outside the bay, is found in Carp Lake, eight miles northwest of Traverse City, reached by highway.

"Deep-water fishing is a variety of sport peculiar to this vicinity. Taking one hundred and fifty or two hundred feet of stout fishing line, and being properly provided with hooks, bait, etc., the sportsman, procuring a boat, proceeds to any part of the bay where the water is very deep, and lets down his line. Presently a siskiwit (the deep-water lake trout, a fish analogous to the Mackinaw trout, but much finer in flavor and flesh), a Mackinaw trout, or a huge muskallonge seizes the hook, and the sport begins. The fish are very gamey, and long before the quarry is safely landed in the bottom of the boat, the fisher will have obtained excitement enough to cause the adventure to be well remembered.

"Brook trout are very abundant in this vicinity. The Boardman, its branches, and all the streams in the neighborhood of Traverse City, contain brook trout. No stream is navigable except the Boardman, and that only for small boats. Current swift, but not too deep for wading; excellent sandy bottom. Parties desiring can find good camping grounds at the 'Forks' of the river, State Road Bridge, Railroad Crossing near Mayfield town line, and Smith's Farm, all on the Boardman River. There are a few grayling in the Boardman, known by the local name of 'Garpin.' Besides the Boardman River, the various trout streams and ponds are Mitchell's Pond, distant three and one-half miles from Traverse City; Hoxie's, seven miles; Whitewater, nine miles; Scofield, twelve miles; Hannah's Mill Pond and Cr. ek, one half mile; Greilick, three miles; Beimer's Pond and Cr. ek, seven miles; also, the Racket, Joyton and Pine rivers, emptying into the Boardman, as well as many smaller streams. Stage fare to Hoxie's, \$1; to Whitewater, \$1.25; to Mitchell's, 50 cents. All other points reached by private conveyances. Guides charge \$2 per day; with boats, \$2.50 to \$4 per day; with team, \$4 to \$6 per day; boats only, 50 cents to \$2 per day."

Taking mail at Traverse City in the morning after breakfast, we reach Reed City at noon, where Brother Adams furnishes an excellent dinner for fifty cents. Here we can fish the River Hersey for grayling and be sure of a fair mess. The town is growing and prosperous, and boasts several fine streets, churches, brick stores and the like. All the country north of here affords the finest deer shooting, as much of it is almost a wilderness and but little hunted. There is a barbe in town, whose name I forget—a long subscriber of FOREST AND STREAM—who studies his gospel from its pages and then hies forth to preach and practice it upon the denizens of the forest, and he always brings back something besides locusts and wild honey. He showed me some trophies of his chase,

There are several good sportsmen in Reed City besides this shaver whom I had the good fortune to meet. Between Walton Junction and Reed City we cross the celebrated grayling streams called the Au Sable, Manistee and Muskegon. The first is Mr. Dan Fitzhugh's favorite stream. I have an invitation to spend a week with him on its waters, but have no time to do so; yet I shall not omit a flying trip to East Saginaw and Bay City, where he lives, the great lumber depots of Michigan. The Manistee river is easily reached from Walton Junction; and by taking the Flint & Pere Marquette road at Reed City we can fish the Muskegon at several points, as the railroad follows it for many miles and frequently crosses it. It will be perceived by reference to the map that this railroad crosses the State at right angles to the Grand Rapids and Indiana Railroad, thereby opening up quite a different part of the country and one much more settled than that which we have been visiting. There are more farms and less game. In the vicinity of East Saginaw some of the farms are greatly improved. The city itself is one of the most wealthy and enterprising in the west. Its private residences are elegant, its streets wide, its Bancroft House hard to beat by any hotel elsewhere, its sportsmen many—refined and influential, and its industrial pursuits various and remunerative. A dozen creeks and rivers concentrate at its very threshold to empty their tributaries into its great manufactories. On the Saginaw River, between Saginaw City and Bay City, there are ninety-two saw-mills, which consume pine, hemlock and maple with a rapidity and fierceness worthy of Sawdow of old. Good dogs there are at Bay City, owned by worthy masters; their regard for each other is mutual and reciprocal. I know Judge Holmes has the finest kennel of deer and fox hounds that it has been my good fortune to see north of the traditional Mason and Dixon's line. The setter tribe is numerously represented among the fraternity. The Fitzhugh family, J. F. Hotchkiss, Judge Holmes, W. H. Estabrook, mine host Van Duzen, of the Frazer House, and other prominent gentlemen were assiduous in showing me the lions of the place—and the rest of the menagerie. To Van Duzen I am indebted for courtesies not anticipated. His house is a superior house in all respects, as indeed are the hotels throughout the State, so far as I have known them. I have repeatedly pressed this fact upon the attention of travellers, for I have never found so invariable good accommodation in any other State, whether in town or country.

Although I had spent nearly a month in Michigan, I regretted that my time was so limited. I was in greater haste to depart, because I wished to fish among the Superior rocks at Ashland, Wis., before the close season began on Sept. 1. So, accepting the courtesies of the Flint & Pere Marquette Railway (after having beaten one of its chief officers at euchre the night before), I set out for Grand Rapids, via Reed City. There I picked up my shooting kit, ate a parting porter-house with my friend Farnham Lyon, of the Morton House, and turned my face toward the Badger State, via Grand Haven and the Western Transportation Line of Steamers to Milwaukee. As the train followed the course of the beautiful Grand River into Grand Haven, I could trace in the pale moonlight the outlines of the sand dunes that the storms had piled in great mounds upon the shifting shores of Lake Michigan. The season was at its height, and the midnight hour had not wearied the festive dancers at the Outler and Kirby, those fashionable watering places where the Michigan belles drink mineral water with the zest and natural effect that folks do at Saratoga and the Virginia Springs. The great steamer Amazon—larger than many an ocean steamer—lay quietly at her moorings in the placid river, with length so huge that she had apparently no room to turn. The freight was on board long since, and when the last rumble of the truck that trundled the midnight passengers' baggage between decks had ceased, all sounds were hushed. Noiselessly and imperceptibly the steamer got under way, and before we were aware that she moved, the lights on shore began to *chance*; the ghostly sand dunes alongside waltzed and crossed over, and eclipsed the lights which seemed to dodge between; the still expanse of the broad lake loomed up ahead in an uncertain view; and the thin reek from the funnel reached out behind in a ribbon of vapor waving an adieu to the solitary watchman on shore, whose only care was now to turn in and rest from his protracted duties.

Pleasant Michigan! No innocent lamb ever fared better among "Wolverines" than I. HALLOCK.

#### GAME PROTECTION.

MICHIGAN.—Grand Rapids, Nov. 26.—The annual meeting of the Michigan State Sportsmen's Association will be held at the Potter House, Battle Creek, in that State, on Tuesday, February 5, 1878. Dr. E. S. Holmes, of Grand Rapids, the President of the association, has already invited several gentlemen to prepare essays on various subjects pertinent to the objects of the society, and the meeting will undoubtedly be of unusual interest. The association is composed of the various local clubs throughout the State. Several new clubs have been formed, and they or others can obtain any information with regard to the State Association from the Secretary, A. J. Holt, of Grand Rapids, Michigan.

Several gentlemen in Monmouth County, New Jersey, are about forming a club for the sole purpose of stocking certain parts of that county with quail, and their intention is to place some three hundred next spring.

THE VIRGINIA CONVENTION.—Explanatory of the failure of this convention which was to have convened at Richmond recently, we have received the subjoined letter from the President of the Virginia Fish and Game Protective Association:

EDITOR FOREST AND STREAM: RICHMOND, Va., Nov. 20, 1877.  
Dear Sir—In your last issue you notice the failure of the convention. The reasons are very palpable: First, The reception of the Governor of Virginia and President of the United States; second, The drilling of the Volunteers preparatory to the competitive drill, companies were here from all sections of the State; third, Having to hold our meeting in a different hall from the one in which we at first expected—although the change was thoroughly advertised, yet a great many persons went to the wrong place. Now comes the inexcusable part. There were in the city the representatives of fourteen clubs, and the Presidents of seven. I had the pleasure of talking with a good many of them. The delegates from only one club reported. There is a very great interest felt on this subject everywhere in the State; and generally the laws are rigidly enforced. Dr. Ellzey's address, the written one I mean, was such a good one that it will appear in the December number of the *Southern Planter*, and will form the basis, if not the text, of our next letter to the people of the State, which will be issued at the commencement of the close season. Yours truly, CHAS. T. PALMER.

ALEXANDRIA, VA.—At a recent meeting of the Rapides Sporting Club the officers chosen for the ensuing year were: Pres., J. W. Prescott; Vice-Pres., Dr. James S. Fish; Vice-Pres., L. B. Raymond; Sec., W. W. Whittington.

THE GAME LICENSES IN NOVA SCOTIA.—There appears to be a general feeling of hostility in Nova Scotia to the exaction of licenses for shooting moose, which is, perhaps, natural enough; though we know of no better method of creating a fund for the pay of the wardens who are employed to protect the game. This opposition is especially manifested by officers of the garrison posts, who, having been accustomed to all sorts of restrictions "at home," we should suppose would feel the necessity of making and sustaining any reasonable law made for the purpose. The *Halifax Chronicle* says:—

"A considerable number (21) of licenses have been taken out by officers of the garrison and navy, under protest, but it is well known that a few, in defiance of the law and of all warnings, persist in shooting without license, and it has been thought advisable, in justice to those who have complied with the law of the land, as well as to test the question, that the matter should be settled by the courts. We understand that the Chief Game Commissioner has accordingly issued a writ against an officer of the garrison for the amount of the penalty prescribed by the law for shooting without license, viz., fifty-five dollars."

In the case of the Chief Game Commissioner of Nova Scotia against certain British officers of the garrison there, for violation of the game law, which prohibits the shooting of game without license, the Justices persisted in different opinions, and were unable to come to a decision. The case therefore now rests in a very unsatisfactory state.

WEST JERSEY ASSOCIATION.—On complaint of the West Jersey Game Protective Society, Edward Small, of Buddtown, and Henry Venable, of Red Lion, Burlington County, N. J., were arrested November 20th, for setting snares for game, and taken before Squire Thomas McKinney, of Vincentown. Small was committed to jail at Mt. Holly, as he could not pay his fine of \$45 and costs. Venable entered security to appear on the 26th of November to be tried. The Society has employed an attorney to attend to the case.

B. W. R.

### The Rifle.

MASSACHUSETTS.—Massachusetts Rifle Association, Nov. 22.—A series of three matches were commenced at Walnut Hill range by the Massachusetts Rifle Association yesterday. Each match at 1,000 yards, with 45 rounds. Prizes, gold medal, and no match to be concluded, unless a score better than 195 was made. Mr. W. H. Jackson made the superb score of 200. Of course Mr. Jackson had to keep up the prestige of the American team, of which he is a distinguished member. The third and final match for the prize will take place December 5. The following are the scores:

|   |   |     |
|---|---|-----|
| W H Jackson.....  | 4 5 5 5 4 5 5 5 5 4                                     | 200 |

Worcester, Nov. 22.—The Cody and Daniel Short-range Match.—This match, to be shot off-hand, fifty yards, between Buffalo Bill and Mr. C. I. Daniels, attracted some attention at the range near Lake Quinsigamond. Each rifleman has his own individual target, a black surface three feet square, with a white bull's-eye four inches in diameter. The weather was raw and unpleasant. The shooting was by no means first-class, and though Buffalo Bill was the winner, his target was by no means a good one. The score in inches and sixteenths was as follows:

| Cody.      | Daniels. | Cody.      | Daniels. |
|------------|----------|------------|----------|
| 1.....2-8  | 2-11     | 7.....2-7  | 0-11     |
| 2.....2-6  | 3-4      | 8.....2-4  | 0-15     |
| 3.....0-13 | 1-11     | 9.....2-3  | 2-13     |
| 4.....2-8  | 0-11     | 10.....1-7 | 0-8      |
| 5.....1-0  | 0-11     |            |          |
| 6.....1-10 | 6-8      | Total..... | 53-6     |

The judges were: Mr. I. P. Austin for the Hon. W. F. Cody, and Mr. F. Wesson for Mr. Daniels. At Greenwood range there was a match for the Washburn

badge. Wind was strong and weather cold, but the scores were quite good:

| Stedman Clark. |                                |

1,000.....0 3 0 3 5 4 5 5 5 5 5 5-60  
This match will probably close the season. We may state that the team has done excellent work, and will certainly occupy a leading position next season.

TELEGRAPHIC MATCH.—CALIFORNIA AND MASSACHUSETTS.—This match was the result of a challenge issued by the Oakland Guards to any company in Massachusetts. Terms: A team match; eight men from each company; bona-fide military rifles, with six pounds pull of trigger; any ammunition; 200-yards range, off-hand; two sighting and ten scoring shots; the match to be shot Nov. 10, at any time between sunrise and sunset, fair weather or foul, and the prizes to be a gold medal (value \$50) for the highest score, and a silver medal for each of the others in the winning team.

The Oakland Guard shot on their range at Melrose, but there was a fog, while the Roxbury City Guard shot at Walnut Hill range near Boston. The following are the individual scores of the Oakland team:

|                       |                            |
|-----------------------|----------------------------|
| H H Burrell.....      | 5 4 4 4 4 5 4 4 4 4-43     |
| S Pierce.....         | 4 5 4 4 4 5 4 4 4 4-43     |
| J S Green.....        | 4 5 4 4 4 5 4 4 4 4-43     |
| C F Waltham.....      | 4 4 3 3 4 4 4 4 4 4-39     |
| F W Gartner.....      | 4 4 4 4 4 4 4 4 4 4-39     |
| Capt H D Ranlett..... | 4 2 4 3 4 4 4 3 4 3-37     |
| J A C Macdonald.....  | 2 4 4 3 4 4 3 3 4 3-36     |
| M R Bankhead.....     | 0 3 4 4 3 2 3 3 0 0-25-502 |

The Oakland score was 30 points better than Roxbury City Guard. It may be remarked that the Oakland Guards have heretofore been almost invariably successful.

WILLOWBROOK RANGE.—The Connecticut Rifle Association shot for Mid-range Badge, Saturday, Nov. 24th. Strong head wind, varying constantly in force and in direction. The scores are as follows:

G. W. Yale, 49; William Parker, 48; Dr. Henry Woodward, 48; Jos. R. Hawley, 47; H. P. King, 46; Wallace Green, 45; Maj. C. P. Graham, 44; F. T. Studley, 43; S. A. Hubbard, 41. The last named used a 40 cal. rifle.

New York, Nov. 24.—Triton Rifle Club.—Under the auspices of Capt. Eldrich, a match was shot at Zettler's Gallery. There were fourteen prizes contested for. Creedmore target; possible 50. The following are the scores:

|                     |    |                   |    |
|---------------------|----|-------------------|----|
| P Gramer.....       | 44 | W Senewald.....   | 35 |
| G Petrey.....       | 43 | H Fleyer.....     | 37 |
| F Sauer.....        | 43 | C Schuler.....    | 36 |
| Capt A Eldrich..... | 43 | F Stude.....      | 36 |
| G Emert.....        | 42 | L Gurth.....      | 35 |
| A Lorenz.....       | 39 | Capt C Young..... | 35 |
| F Nau.....          | 38 |                   |    |

Creedmore, Nov. 24.—There was a heavy gale of wind all day which is required some pluck on the part of riflemen to face. The matches shot were those of the Seventh Regiment Rifle Club and the Irish-American Rifle Club, open to the members of the respective clubs only. The Seventh Regiment Club shot for the bronze medal of the National Rifle Association. There were twelve entries. Captain J. L. Price won the medal on a score of 49 out of a possible 70 points. The regimental medals were also shot for under the same conditions. Private C. H. Eagle won the first on a record of 48 out of a possible 70 points, and C. M. Englis and J. E. Nichols won the second and third, respectively on inferior scores.

The Irish-American Rifle Club match for the mid-range badge. The badge to be won three times, not necessarily consecutively, before becoming the personal property of the winner. There were seven entries. Dr. M. M. Maltby won the prize for the second time on a remarkably good record, making 70 out of a possible 100 points.

A number of regimental and other club matches are set down for Thanksgiving Day, and it is expected (if the weather be favorable) that a large number of riflemen will turn out. Shooting for prizes we have already announced to take place the same day on the Glendrick Range.

TWO IDENTICAL SCORES.—Here is an item of interest to riflemen, showing a coincidence in rifle shooting never before accomplished, and which, in all that has been written on the recent international rifle match, has not been brought out. In three days' shooting of Gen. Dakin he scored as follows, viz.: 210, 215, 210—635; and Chas. E. Blydenburg made the following: 206, 213, 216—635, each making the same total in the three days' shooting. By reference to our files, the dates on which this shooting was done are readily found. These gentlemen used the Remington breech-loader.

ZETTLER'S GALLERY, Nov. 22.—The second competition for the Engel medal was shot for by G. Co., Seventy-first Regiment, N. G. S. N. Y. Capt. Webber. Possible 50; Creed more target. The following are the scores:

|                        |    |                      |    |
|------------------------|----|----------------------|----|
| Sergt Alex Steele..... | 41 | Corp E Demmler.....  | 32 |
| Priv M D Moore.....    | 40 | Lieut S Blakley..... | 31 |
| Capt A L Webber.....   | 39 | J Durand.....        | 35 |
| H Farrel.....          | 34 |                      |    |

Sergt Steele won the medal for the second time. The next match will take place December 4.

HISTORY OF THE ZETTLER CLUB.—The Zettler Rifle Club was organized June 18, 1874, number of members limited to 35, won two matches in 1874 with Hellwig's rifle team, ten men a side; also, beat the same club twice in 1875; beat the

Centennial Club, of Jersey City, ten men a side, Aug. 1876; beat a picked team of New York City, ten men a side, shot at Conlin's Gallery, May 11, 1877. At the great Schuetzenbund, held in Philadelphia, 1876, our club, although inexperienced then as 200 yards' shooters, came in fifth best, out of ten teams entered; also brought away some fifty prizes in all. Beat the Columbia Rifle Club, three matches at 200 yards, shot at Guttenburg; first match, shot March 1, 1877, ten men a side; second shot March 11, 1877, fifteen men a side; third, match shot April 13, 1877, fifteen men a side. We suffered our first defeat at the hands of the Helvetia Rifle Team, a club composed of some of the crack shots of other clubs at Union Hill, fifteen men a side, Oct. 1, 1877; second match, shot Oct. 29, 1877, fifteen men a side, which we also lost. At the Schuetzenfest to be held next year, 1878, at Union Hill, under the able management of the President, Captain Geo. W. Aery, President of the United Schuetzenbund of North America, the Zetter Club will undoubtedly do their best to secure victory.

**ZETTER RIFLE CLUB**—Weekly Shoot, Nov. 20th.—Creedmore targets reduced to Gallery distance, 10 shots per man, possible 50:  
John Dutil, 48; C. G. Fetter, 48; Gus. A. Shurman, 46; M. L. Riggs, 46; B. Fetter, 46; P. Fenning, 45; L. Beates, M. W. Furrow, 45; Wm. Kline, 44; Chas. Judson, 43; Theo. Klierath, 43; D. Miller, 41; M. P. Moore, 41; G. L. Petry, 41.

**CONLIN'S GALLERY**.—There will be practice shooting at Conlin's Gallery, 1222 Broadway, on Thanksgiving, day and evening.

**SARATOGA RIFLE CLUB**—Saratoga, N. Y.—At a regular meeting held on the 12th of Nov., the following officers were elected for the ensuing year: President, James M. Andrews; Vice-President, Albert F. Mitchell; Treasurer, W. F. Howard; Secretaries, Wm. H. Benson, Capt. O. J. Wing; First shooting master, E. Davis; second shooting master, W. J. Lergett. The regular November shoot took place on the Spring street range on Saturday last. In the morning the shooting was at 500 yards, and in the afternoon at 200. Possible number of points, 50 at each range. At the 500 yards, the first prize, a fine gold badge, was won by Wm. H. Benson, and the second, a Centennial medal, by F. D. Wheeler, Jr. At the 200 yards, the first prize, the Farrington gold badge, was won by Wm. H. Benson; second, a fine watch chain, presented by J. H. Moody, was won by Irvin Davis. The following are the scores:

|   |                     |       |
|---|---------------------|-------|
| W. H. Benson, Sharps Rifle.....   | 5 5 4 5 4 6 5 5 5 5 | 45    |

| 1,000.....  | 0 0 0               | 0-0   |

**SAN RAFAEL RIFLE CLUB**—Cal., Nov. 11.—The following is the score made by the San Rafael Rifle Club at 200 yards:  
R. C. Moore.....5 4 4 3 5 5 4 3 4-40  
R. D. Moore.....4 3 4 4 4 4 4 3 5-39  
R. A. Roche.....4 4 3 4 4 5 4 3 4-39  
T. J. Jacobs.....5 3 4 4 5 3 3 4 4-33  
G. W. Parker.....5 4 4 4 4 4 4 4 3-38  
T. J. Crowley.....2 3 3 2 2 4 4 4 4-29

Team shooting is spreading, for the Sacramento Pistol Team are now in the field. Range, twenty yards; method of scoring, with the target twelve inches in diameter, and a bull's-eye of seven-eighths of an inch in diameter; ring graded from 1 to 11, and bull's-eye two points. Score:

|                  |                         |         |
|------------------|-------------------------|---------|
| Atkinson.....    | 10 10 9 10 10 10 8 10 9 | 8 12-95 |
| Brewer.....      | 9 7 7 10 12 12 12 9 12  | 96      |
| Byers.....       | 6 8 9 10 9 7 11 10 9    | 86      |
| Dixon.....       | 10 10 7 0 11 7 0 6 0    | 54      |
| Gerber.....      | 11 9 6 5 10 8 8 8 8     | 81      |
| Goldthwaite..... | 10 10 4 0 11 7 6 5 0    | 53      |
| Griffiths.....   | 11 11 10 9 12 11 11 9 8 | 103     |
| Jackson.....     | 8 9 8 4 11 9 9 10 8     | 89      |
| Reed.....        | 9 7 8 4 7 9 9 8 8       | 79      |
| Williams.....    | 10 9 8 6 11 10 8 8 2    | 81      |

Mr. Griffith's score of 103 is a very good one.

**DEPARTURE OF MR. W. RIGBY AND MR. R. S. GREENHILL**.—After having made quite an extended tour through the United States, these two gentlemen left on Saturday for England. They express themselves as highly delighted with their visit, and state that they are not likely to forget the kindness and hospitality with which they have been received.

## THE RIFLE ON RUNNING GAME.

### NO. II.

In the previous article I said the first thing to be done when a deer starts is to remember that you have a rifle in your hands and not a shot gun. The number that can be missed, even inside of 75 yards, with a rifle fired as a shot gun, by good shots on a picture or woodcock, is perfectly amazing. A deer in market or in a picture looks quite large, but in reality they are a very small mark. There is around them an immense amount of vacancy and the tendency of a bullet to find it is marvelous. In the winter of 1868 and 1869 on the head waters of the Chippewa River in Wisconsin, out of over 50 first-rate running shots that I got in about a month's hunt, I

hit just exactly two, and only scratched hair on them. Only two months before that I had killed 19 equal hand-running in thick brush, and had repeatedly killed 12 or 13 successive shots in the thickest kind of New Jersey cover. At the same time I could with the rifle hit a deer standing about as well as most men. This is a humiliating confession to make, but I do it for the benefit of those who may get in the same situation, to show that a shot-gun aim is perfectly useless, except, of course, by accident. Had I never touched a shot gun, I would doubtless have done much better. For the instant a deer would start, off went the rifle the same as on a quail, and I forgot all about the sights.

After breaking myself of that fault, the next blunder was not shooting far enough ahead. I knew, of course, that it was necessary to shoot somewhat ahead, the same as with a shot gun, but had no idea of how far until all my good chances were wasted, and the season out. And my experience in these two respects corresponds exactly with that of all others whom I have met. This distance is surprisingly great. Almost every one in his first attempt at duck shooting, has been surprised to find himself missing beautiful crossing shot, while holding directly on or even a few inches ahead of them, and has finally discovered that two or even three feet ahead will kill where six inches will not. It is even more so with a deer, for a bullet does not scatter, and half an inch is a miss. Moreover, he is much further off, as a general thing, than ducks are, and is also moving much faster than one supposes. As the margin required will vary with the distance, speed of the game and speed of the ball, it is impossible to lay down any reliable rules. Nor can any mathematical calculations be of any avail, both for the same reasons, and the further difficulty of applying them when made. It is also difficult to express practical knowledge on the subject in figures. But I will try and give a few as a rough guide to your own practice. These as well as all figures heretofore given will necessarily be inaccurate, for I can only guess at them as they appear to me over the sights. They may be as much as a foot or more out of the way.

A deer seldom runs at full race-horse speed. His usual gait is a graceful canter or springing jumps. Still he is going faster, and your bullet is much slower than you suppose. I have never had more than two shots at deer running broadside at a racing point. The first was about seventy yards off, scratching dust at a furious pace. I fired at what seemed to me fully five feet ahead of him, and saw the ball tear the dust from a knoll about thirty yards beyond him, in a line with his tail, but apparently three or four feet behind him. This deer must have moved fully twelve feet at least while the ball was traveling the 100 yards. The next one was not over forty yards, and, recollecting the other, I held about the same distance ahead, striking him just back of the shoulder. A hare (Oai! fonia jack rabbit) under full speed, at fifty yards, wants about five feet margin, running at a light gait about 2½ or 2. Running quartering at forty or fifty yards I have repeatedly struck just behind them, although holding a foot ahead. And even when running at a very sharp angle to the line of fire, I have invariably made the dust fly behind them when holding directly on, and this, too, at not over twenty paces distance. Holding ahead must never be neglected unless your deer is very close or going very slow, and even then it will be safe to hold off the body, even though it may also be safe enough to hold on. At a deer driven toward me, and coming on a course so slightly quartering that he would have passed within twenty yards of me (or as our Creedmore riders would aptly express it, coming like a 11 o'clock wind), I fired at about 75 yards. I held just so as to see a strip of daylight ahead of his breast, and struck in the middle. These distances are taken from shooting done with a .44-rifle, seventy grains of powder, and the long-range (530 gr.) ball. With 77 grains of powder I could see no difference in practicing on hares, although with a round ball the difference is perceptibly less at 100, and even up to 120 or 130 yards, though not enough to be of much consequence for deer. In shooting from a running horse it will, of course, not be necessary to hold ahead where the speed is equal.

The large hare makes the best of all practice next to deer, when you can get them on ground where you can see the ball strike. In Southern California the ground is so dry during three-fourths of the year, that the dust will fly whenever the ball touches, and when deer are out of season (and even when in season), I have capital sport as well as capital practice in this way.

But if you cannot have opportunities on living marks you may make a good running target, with a solid wheel, sawed out of a two-inch plank, about eighteen inches in diameter and rolled down hill by some friend who is short of better amusement. But if accommodating friends or impecunious small boys are scarce, make a frame for it of two pieces of plank, nailed edgewise on a third piece, two or three inches apart. Drive a nail in the top edge of each, and lay a wire across back of them to hold the wheel in place. Set the frame at the top of a hill with a lively slope, and with a loose string attached to your wire, let it start when you get in position. Try it first at thirty yards, until you can hit it twice out of three times. Then increase your distance and its speed from time to time. If you can get, or so fix, the hill side as to make it give a regular bounce it will be much better. The only trouble with this is, that, like the Creedmore running deer target, it does not give variety enough. But it is first-rate where you can get no better, to say nothing of the appetite acquired by packing that wheel up hill fifteen or twenty times.

It is not necessary to throw your rifle ahead of the game when you first raise it. But it is always expedient to do so. If you raise it directly on the mark the temptation to pull is often too strong to resist.

The tendency to overshoot game with a rifle is one of the remarkable and inexplicable things about hunting, and where is this tendency so strong as on running game. It was for this reason that I told you to file the back sight flat on top. If the sides are higher than the centre notch, there will be a constant tendency to shoot too high from trying to see your game above them. With a little practice you can catch this sight quite as quick and shoot just as well as with the "back sight," which for good work is only a useless nuisance. I go still farther, and out down the sides about one-twentieth of an inch, leaving about one-sixteenth of an inch on each side of the centre notch (which is simply a fine split) standing above the rest of the sight. Over the sides of this can get a clear view of the whole body, even to the feet of a deer in any way he may run. I find that I can catch this sight just as quick as any other, after a little practice, and am not half so apt to

over-shoot with it. Twice I have killed as high as three hares out of five shots at over forty yards running broadside with this sight; although I must admit that there is a tremendous amount of "scratch" about such shooting as that, as, owing to the jump of the hare, which it is impossible to take into account, it is very difficult to avoid over or under shooting at least one-half the time on an average, besides the difficulty of getting the right margin. The value of your shot on such small game must be tested always by the question, *where does the ball strike?* And not by its hitting or missing him as you may make a dozen capital shots without touching so small a mark.

For running shots a set trigger is an abomination; equally so is the three pound pull. It should be so that a moderate jerk will fire it without disturbing your sight, and without the necessity of beginning a moderate pressure as you would with a hard trigger at a target. About one and one-half or one and three-quarters pounds is about right, though for a heavy rifle two pounds would perhaps be easy enough.

Thus far I have spoken of open shooting. When you try to shoot in timber you may be edified by hearing your ball "whack!" into a tree between you and your deer. You must now watch three things: 1st your sight, 2d your deer, 3d the trees. Where trees are very thick it is often best to pick out an open place and throw your sights into that, firing just as the deer goes within the right distance from them. But be sure and not wait until he touches the line of your sights or you will miss him if he is going at any speed or is at any distance.

There will be generally little use in shooting beyond the point-blank of your rifle; unless in cases where there is no probability of your deer stopping for a standing shot. By point-blank, I mean the distance to which your rifle will shoot over the fifty yard sight, so nearly level that the drop of the ball need not be taken into account. As soon as it becomes necessary to make allowance for the falling of the ball this kind of shooting becomes uncertain, from this cause and the increase of margin that is necessary for the increased distance as well as the difficulty of allowing for the up and down motion. After a few trials you will see the gigantic absurdity of all talk about killing on the run at two hundred and three hundred yards. An examination of the scores at the Creedmore two hundred yard target will soon show you that it is no child's play to kill a deer standing at two hundred yards, even when the distance is exactly known, and you will be more firmly convinced when you come to try it. And this difficulty becomes enormous when the mark is in motion, and its distance not known exactly. You would have to guess the distance to within fifteen yards, and that too in an instant, throw up the proper sight or else shoot over the open sight so as to allow for about five or six feet fall of bullet, and shoot from ten to twenty feet ahead. This would be hard enough if the deer were only trotting, to say nothing of a high lope or springing gait. Such shots may of course be made, but they are "scratches" and terribly scratchy ones at that. It is safe always to conclude that the man who tells such a story is a very poor judge of distance and to discount it one hundred per cent.

Remember that coolness is absolutely indispensable and that haste will do you no good. Let quickness come with time, and practice slowly and carefully. Do not be beguiled into fast shooting at that Creedmore target; make it your first point to hit, and don't shoot at first more than once on one run, unless you have a double-barreled rifle. Let others try to see how big a hail storm of bullets they can get up in a given time if they like it, and don't be at all bothered if by so doing they happen to make more points than you. You will in the end do by far the best work on game if you take it easy and make accuracy the first point.

Recollect always your sights; sights first, sights next, sights last—never forget them. Don't be in haste; it is far better to let a deer get twenty or thirty yards farther off than to take a careless aim or get your eye off your sight. And never try any scrap shots, unless of course, when another jump or two will take him out of sight. And never try to get in a shot ahead of your companion if you happen to have one, but shoot just as if alone. If you follow this advice carefully you will be surprised at the progress you will make, and at the amount of true pleasure you will have, although you need never be ashamed of missing even a fair shot.

Miners Ranch, San Diego Co., Cal.

J. S. VAN DYKE.

## UPSET OF BULLETS.

UTICA, Nov. 5, 1877.

EDITOR FOREST AND STREAM:

I should be glad if you would give me some space in your paper in order that I might present my views on rifles and the upset of bullets, and to correct a mistaken idea that I think the general public have of muzzle-loading rifles—I mean those which have been used in the great rifle contest. I have taken the FOREST AND STREAM for the last three years and have read many articles on rifles and rifle shooting with much interest. I saw the mistaken idea that the public had of those muzzle-loaders, and have waited in hopes that some one more able with the pen than I am would correct it. The general opinion is that there have been tests between muzzle-loaders and breech-loaders; I claim there have been no tests with what riflemakers and all crack shots call muzzle-loaders. The proper muzzle-loader is provided with a guide starter, which is fitted to the muzzle of the gun in perfect line with the bore; with this starter the bullets with a linen patch are driven into the gun and fitted to the grooves air tight.

This insures that it will follow the grooves in coming out, and in case it is not expanded by the powder, it will not make a very "bad unaccountable" shot. When solid bullets are used in these guns, only part of the bearing on the bullet is fitted to the grooves in loading, allowing the powder to expand it to complete the bearing. If I understand it, the bullet for those muzzle-loaders (made by Metford and Rigby) are put down the bore with a paper or linen patch, and do not take the rifling sufficient to follow the grooves, until it is expanded by force of powder, and therefore do not represent a proper muzzle-loader.

The bullets for our American breech-loaders are prepared with a paper patch, and just fill the bore without taking the rifling, the same as the Metford and Rigby rifles; therefore both are on the same principle. It matters not where the bullet is put into the

gun if both depend on the expansion by force of powder to make it take the grooves. There is no reason why that style of muzzle-loader should shoot any different from the breech-loaders; the bullets to both guns are made similar in form and hardened with tin so as to prevent them from expanding too much. But it sometimes happens (from different causes) that they do not expand and take the grooves, which is the main cause of those "unaccountable" shots. It is evident, from close examination of the diagrams made in those matches within the last three years, that the difference between those muzzle-loaders and breech-loaders is not worth talking about. The diagrams made by both teams show that some members had better guns than others, and made better scores in consequence. Any man who is posted on rifle-shooting can tell at a glance at those diagrams which had the best guns, and whether the style of shooting showed a fault in the gun or marksman. Compare Dakin's target and some others with Blydenburgh's, and the great difference in the qualities of the gun. Dakin made good wind, but his gun made too much up and down to make a full score, and the targets show that it was not his fault. The variation of one-thousandth part of an inch in the bore or form of rifling in those guns is what makes the difference, and if the bullets were hardened, the most suitable and the best charge of powder used for each gun, it would probably remedy the difference.

Rifles that are considered the most accurate are those that carry the greatest number of shots to a horizontal line, and the great study has been to make guns perfect, and the bullets for them of such form and hardness as to give the most uniform power. Your correspondent, "Straight-bore," gives the idea that the upsetting of bullets is of recent discovery. In this allow me to say he is mistaken. It was well known by the best riflemen twenty-five years ago that a bullet expanded in the breach of the gun by force of powder the instant it started, the powder giving it a blow like striking it with a hammer, and the reaction forward of centre of gravity caused the bullet to upset—shorten—and fill the bore and often take the grooves above the patch. It was also discovered impossible to cast bullets of any soft lead and get them uniform in density, owing to some foreign substance in the lead. By squeezing a number of conical bullets lengthwise in a vise to half their length they were found to be knotty and uneven, showing that if they were much expanded in the gun they would become crooked and unsteady in their flight. The fact was proven by shooting them into snow.

The best riflemen have acted on this knowledge of upsetting of bullets and uneven density of lead ever since, and devised ways to get the most uniform expansion by hardening the bullets with block tin or antimony, and using a grade of powder most suitable for the size and length of bullet used. Some years ago bullets were made in two parts, the forward part of antimony and lead, then a shell or butt of soft lead was cast or swaged on to complete them. These bullets were made to get a more uniform expansion, and to confine the bearing within the patch where it should be. These are the best bullets in use at the present day.

The length of guns was also considered, because with too quick powder there is a column of air packed within the barrel, near the muzzle, which diminishes the power. I have known powder so quick that a small charge put into a long rifle barrel (that was freed or choke-muzzled) that it expanded a conical bullet into a cylinder shape and stopped in the choke at the muzzle of the gun until all the gas escaped at the nipple. The same amount of powder put into a three-inch barrel pistol would have driven the bullet through two inches of pine. But the bullet would have upset the same in the pistol. Resistance to the bullet by friction or otherwise while the powder is being consumed gives the greatest force and less power after it is consumed. The same applies to shotguns. The English have a mistaken idea—and most Americans too—that extreme long range rifles were not made in this country previous to these rifle contests. Such rifles were made in New York State ten years ago, and there are many of them in use at the present day that can make a score at 1,000 yards equal to the best that have been used in these long range matches. I know of twenty-six successive shots made with one of these guns at 600 yards, all within seven inches in diameter, and made previous to this rifle contest.

Another absurd idea is our riflemen "classing guns by weight." A barrel of ten pounds weight will shoot as well as one of twenty pounds of the same bore and length, provided the light one is not fired so rapidly as to heat it. It is true that a heavy one has a little the most power, but the difference is not worth talking about where both guns are made with equal care. The fact is gunpowder is so quick that it takes the most of its power from a small amount of dead weight, and the light guns shoot about as well as the heavy ones. Rifles have been made heavy to do away with the unpleasant recoil.

The light Creedmoor rifles do not shoot well from a solid or hard rest, owing to the expansion of the barrel when it comes in contact with a hard substance and causes the muzzle to jump, but they do shoot well from a cushioned rest, or on the body in the positions taken, which are not much inferior to a cushioned rest. My opinion is—and I have good grounds for giving it—that muzzle-loaders will soon be made that will shoot one-third less up and down at 1,000 yards than any now in use. Gzo. H. FERRIS.

## CAUSES OF INACCURATE SHOTS.

### EDITOR FOREST AND STREAM:

The lamentable and apparently inexplicable accident which occurred at the target shooting near Albany, which resulted in the loss of a life, because a bullet diverged some thirty feet from its expected line of fire, seems to call upon all who can give any explanation which may possibly account for the result, and which may tend to lessen the chances of a repetition, to do so, even if, as in my case, it is necessary to plead guilty to a certain amount of stupidity.

The day of the accident I was attending a turkey shoot, and had with me a small cavalry carbine, throwing a heavy ball. I have used this gun for years, and have become so accustomed to it that I have always felt it safe to make a good record at anything from a sparrow at fifty feet to a turkey at two hundred yards. Upon this occasion something was wrong. The balls flew to the left and right, in some cases fully thirty feet, and, in many instances,

struck the ground at not half of the distance, and in others, by their peculiar noise in flight, indicating very plainly that they were turning all sorts of somersaults in the air.

Out of regard to the marker's feelings, I laid the gun to one side, and met the gibes of the countrymen upon my poor shooting by a general remark that the sights were out of order. The fact was that by accident I had provided myself with a lot of cartridges one size too small. My gun requires 56's; I was unsuspiciously using 50's. Upon cleaning the gun after my return home, I found why the balls had diverged so much to the right and left. Several of the grooves were so badly leaded that a ball dropped in at the breech would lodge upon the lead, while after scraping out the obstructions, it would drop through without touching.

If by an accident the unfortunate marksman at Albany was using as I did—too small a ball—he had worse luck than I, for it is not to my credit that I did not kill a marker. That small balls alone were the cause of my wild shooting was made very evident by my striking an inch circle three times in five shots, at sixty yards, the next day, the only change being in size of ball.

OCCASIONAL.

## LETTER FROM SIR HENRY HALFORD.

The following exceedingly interesting letter we take from the *United Service Gazette* of November 10th:

### THE MATCH AT CREEDMOOR.

To the Editor of the *Volunteer Service Gazette*:

SIR—It is very satisfactory to see so much interest taken in the result of the Centennial Match at Creedmoor. What I most feared was that the cold shade of indifference which was shed upon us before our departure from England would still throw its blight upon us on our return. The letters in your columns, however, show that defeat has, as usual, roused the Britisher from his apathy, and so I venture to trouble you with my views of the causes of our failure to win the Centennial Trophy.

It will be well in the first place to compare our system of prize shooting with those which are used in the United States. There the individual prizes are few in number and small in value; twenty dollars (or five pounds) being a large first prize. Here they are many in number and often large in value. There the team matches are many with scarcely any, if any, money prizes—here they are very few with no money prizes. There men shoot for honor—here, I am sorry to say, with some exceptions, for the pot. The result is that our men, having to rely on their own skill and judgment, become, as individuals, better riflemen than the Americans. They, on the other hand, have learned the value of drill and organization, and herein lies the secret of their success in team shooting.

The team that we had to contend against had been at work as a team since April last with its staff of coaches and spotters, in whom the men learned to place the utmost reliance, upon the very ranges on which the match was shot. On the other hand, our men were only able to have three days' practice together as a team—a time utterly inadequate for some of them to throw off their old habits and subordinate themselves to the judgment of their coach, who, with four times the data to work upon, and the latest information of any changes of wind, ought to be able unhesitatingly to give the amount of allowance required if only his men will shoot quick enough and are steady.

To put a team properly together is a work of months, and under the rules for the Centennial Trophy, it appears to me impossible to send out a united team fit to represent our country unless Scotland and Ireland waive their right to send teams of their own, and join heartily with us in trying to wrest the prize from America.

The other points upon which I would touch are—the Ranges, the Rifles and Positions.

I went out to America with the idea that Creedmoor must be very easy ground to shoot over, not only from the high scores made by the Americans themselves, but by the foreign teams also which had contested on it. I do not now, however, consider it easier than many of our own ranges would be, were they properly flagged. Mr. Toller asks if they know what a fishail wind is? The answer is that they hardly know of anything else. They have, however, plenty of flags in the right places, and a large clock-dial to indicate the direction of the wind. The big scores made by foreign teams are due partly to these appliances, but chiefly to their improvement in team shooting, the result of the practice, small though it may have been, that they have had shooting together as a team.

Now as to the Rifles. I have not in the least lost my confidence in our rifles, but to get work out of them as good as the Americans get out of theirs, they must be treated with the same carefulness and attention. Without cleaning, the American breech-loader is absolutely useless, for no second cartridge can be inserted. With partial cleaning they stand no chance against our rifles uncleaned. When thoroughly cleaned they are, I think, better than ours uncleaned; but when both are treated alike, and thoroughly cleaned, I have every reason to believe that our rifles are superior to theirs. I have had two of them for two years, have tried them well, and have always beaten them with a Metford. I have brought two more over, as the makers claim some improvements, and shall again give them an exhaustive trial. My own personal experience has convinced me that a muzzle-loader can be cleaned quite as easily and certainly as a breech-loader. The Americans are now experimenting with muzzle-loaders of their own make, and report most favorably of them, and are also, some of them, providing themselves with our rifles. They are quite tired of the trouble attending the use of the breechloaders.

With regard to Position. The match will, I trust, convince the shooting public that they must, if they wish to become successful shots, give up the forward position for any rifle matches. I was convinced two years ago, and at that time discarded it for all but military rifles. We should have lost the match if all had been on their backs, so must not give undue weight to the fact that three of our men shot on their faces, nor forget that an average of our highest score would not have been sufficient to win.

To sum up. We lost the match for want of time to organize our team properly, and our scores were further pulled down slightly by want of a thorough knowledge of the range—by position, and by want of sufficient care in loading our rifles.

In conclusion, let me say that I have had an intimation that the Americans would not refuse a friendly match at Wimbledon next year (not for the Centennial Trophy) should our N. R. A. invite them. If they do come it will be no child's play to meet them. They have a team; we have to make one.—I am, yours faithfully,

Wistaro.

H. ST. J. HALFORD.

This letter of Sir Henry's is an excellent one, and American riflemen appreciate the compliment when Sir Henry says, "there (in America) men shoot for honor—here, I am sorry to say, with some exceptions, for the pot." But we by no means see by what argument the gallant Captain of the English team comes to the conclusion that, "as individuals, our men are better riflemen than the Americans." This dictum we can by no means allow. Another point of difference is in regard to guns; essentially bound up in the love of muzzleloaders, Sir Henry sees but little good in breechloaders.

If, however, Sir Henry Halford has no doubts as to the superiority of English muzzleloader, Mr. Miller has, as has also a correspondent, who signs himself Breechloader, whose letter taken from the *Volunteer Service Gazette* we copy.

To the Editor of the *Volunteer Service Gazette*:

SIR—I shall be glad if you will allow me to say a word or two on the above subject. First let me express a hope that some of the British Team who have procured American rifles will give us the information asked by your correspondent "Martini" in last week's *Gazette*. We shall then, perhaps, be able to form some opinion as to the correctness of Mr. Herbert Miller's certainly forcible arguments. In a great match, like the Centennial, where the national honor is at stake, we ought to see that the British Team is armed with the best rifle known to science. Some of our "cracks" say that our rifles are "second to none." This intelligence would be very re-assuring if it were not for the awkward little fact that the American rifles have beaten the British three consecutive times. The truth is, not one British rifleman in a thousand knows anything at all about the American gun. In our usual British conceit, we jump to the conclusion that everything English must, as a matter of course, be better than anything foreign, without even taking the trouble to find out whether it is so or not.

I quite agree with Mr. Miller that the quality of the American rifles is a fit subject for investigation. On the whole, we have not a single atom of reliable evidence to show that our rifles are as good as the Americans'.

There now seems a disposition to put all our eggs in Mr. "Coach's" basket. If the "Coach" were to break down what would become of the poor trigger-pullers?

Mr. Miller possibly sees this danger, as well as

Your obedient servant,

BREECHLOADER.

## PAPER SHELLS.

Manufactured by the Union Metallic Cartridge Company, are Superior to any Shells of the Same Grade in this Country or Europe.

They are SURE FIRE, WILL NOT BURST in the GUN, and are warranted to shoot as well with the same charge of powder as any shell in the market. A letter published in the *Chicago Field*, Sept. 22, giving the result of a trial made with No. 12 Lion Shells which are claimed to save 25 per cent. of the powder, and give almost no recoil to the gun and No. 12 Bridgeport Paper Shells, says:—

"Four of each loaded with 3 3/4 and 3 1/2 drachms of Ladin & Rand's powder, and all with 1 1/2 ounces by weight, or 253 pellets to the charge counted, of No. 7 Chicago shot. Distance 40 yards to muzzle of gun, target a circle 30 inches in diameter, a bull's-eye center, 1 1/2 inch circle, penetration pads 9 1/2 inches by 1 1/2, 30 sheets to pad, made of heavy, hardware paper, 80 sheets large enough laid on each other making 24 pads. The gun was shot resting across a bag filled with straw. The following is the result:

| ST. LOUIS PAPER SHELLS. |                                    |  |                           |                                 |

| 2 L. B. ....      | 1                                  | 45   | 233                       | 18                              |
|                   | 5-26                               | 220-618  | 986-2,762                 | 73-200                          |

All the shells were loaded precisely the same as near as I could load them, with one black and one pink edge wad over powder, and one black edge wad over shot. I have no comment to make on the relative merits of either shell, the figures stand for themselves. I could see no difference in the recoil of the paper shells. I think the reliability of the Bridgeport paper shell is worthy of mention, having used a large number in the past three years without having one misfire. I can't say as much for any other paper shell I ever used.—[467]

## THE CATAMARAN TARANTELLA.

We express our indebtedness to the *Spirit of the Times* for the use of its excellent cut of the Tarantella, which graced the pages of our contemporary last week. From an exceedingly interesting article, due to Mr. N. G. Herreshoff, the builder of this catamaran, we take the following extracts.

As to the tendency of catamarans to turn over, Mr. Herreshoff writes: "And now, whilst we are flying along, with the waves lifting and breaking high under the after tie-beam, let us overhaul another of the alleged failings of the catamaran, to wit: Their tendency to turn over end-wise or pitch-pole. Now, the centre of effort of the sails of the Tarantella are 14ft. 6in. above the water-line. With the wind abaft of beam the tendency to bury the bows of the hull is quite obvious. This desire to bury forward is corrected, in a measure, first by having more than an ordinarily large jib, which, on account of its inclined position, lifts strongly that part of the boat. Then the midship link, at which point is imparted most of the press of the sails upon the leeward boat, is so placed in relation to the displacement of the hulls, that the downward push (to which the force of the wind on the sails is resolved) presses more toward the stern, so the leeward boat always keeps in good fore and aft trim. The trouble then lies only in the lifting of the stern of the windward hull. Of course, if you lift the stern of the boat, and thus make the bow bury itself, the effect is just the same, and just as unpleasant as when the bow sinks for want of buoyancy with the trim of the stern where it should be. \* \* \* Building the catamaran high in the bows cannot remedy this fault in the least degree; the only thing to be

done is to take care of the stern, and the bow will take care of itself. Having stationary ballast will keep the stern down, but this is against my principles. I want to have everything about the boat as light as can possibly be; so when the stern of the Tarantella looks light, my companion sits on it, and says it is one of the best seats on the whole boat. It is almost always dry, and one gets there a more realizing sense of the speed with which she tears along. It is as it would be riding on the back of the wildest horse; not nearly so wild, in fact, but a great deal steadier, having only a purely up and down motion as she flies over the waves, which is most exhilarating and exciting."

Writing of the speed of the Tarantella, for she must be a fast one, the same authority states, I have made lately several trials of windward speed in the Tarantella, the best of which was a boat to Newport from Bristol, distance 13 miles. The wind was so nearly ahead, that the sum of the length of the port tacks was  $7\frac{1}{2}$  miles, whilst that of the starboard was  $8\frac{1}{4}$  miles. This run was made in 1h. 53m. The tide was fair. From this and several other similar trials, I have rated the maximum speed of the Tarantella, dead to windward, at  $6\frac{1}{2}$  miles an hour. Of her speed, in free wind sailing, the fastest I have actually measured, was 18 miles an hour, though on one other occasion I am positive of sailing over 22 miles an hour. It was at the first striking of a squall, the water was nearly dead smooth. Unfortunately I was not near any point where I could take time. These extreme speeds are by no means made every day in the week. In our average summer winds, say about three-fourths of a whole sail breeze, the catamaran, sailing free, will go 15 or 16 miles an hour.

As the season advanced, and the winds became stronger, I had several opportunities of trying the Tarantella under shortened sail. With a three-reefed mainsail and storm-jib, I made as fast time in smooth water as under any condition. With a double-reefed mainsail alone, she worked admirably to windward. But what seemed to me most surprising was, that, under shortened sail, she would make remarkably good time, even faster than the common style of yachts, and that in breezes when all sail might be carried.

One day, late in September, the wind in force, and direction chanced right for me to race with the Richard Borden, our fastest bay steamer. I lay in wait for her, as she was making her daily trip to Providence, and pounced upon her off Pappoosequaw Point. I passed her with the greatest ease, and at Rocky Point I was a full

half-mile ahead, notwithstanding the breeze which over the last part of the course became quite moderate. The last act of the season was the sale and delivery of the Tarantella to Commodore F. Hughes, of Greenport, L. I., under whose flag she now sails."

Mr. W. L. Alden, (whose article on catamarans in *Harper's Monthly Magazine* of October last was so favorably read by yachtsmen), gives the highest praise to the Tarantella, and the skill evinced in her construction. Mr. Alden considers that the flexible joint system, as used by Mr. Herreshoff in the coupling of the catamaran, is a most admirable idea, in fact, just the improvement which cultivated thought would give to the original barbaric conception.

—The arrival of the bark W H Reese at Bath, Me., with a cargo of masts, spars, decking and ships' keels from Puget Sound, W T, is considered by the Bath *Times* an event worthy of note. The Boston *Advertiser* remarks:

Suitable spars for our large ships, and suitable plank for upper decks of first-class vessels of any size, have for many years been difficult to obtain. The appearance, even the value, of many of our fine ships has been greatly lessened by the short, knotty, splintered, miserable decks given them. If these Oregon spars and plank prove what is claimed, there is no doubt but they will be readily sought for and purchased.

—J. H. Rushton, the manufacturer of the best light cedar floats in the country, is erecting a new building on Water street, near the stone blacksmith shop, to accommodate the increasing demand of his business.—*Plaindealer, Malone, N. Y.*

## New Publications.

## MAGAZINES.

Wide Awake for December! That exclamation point is for the boys and girls when they tear off the wrapper. A Fox figures in the frontispiece, and the exploits of his cunning highness are narrated in a sprightly sketch, by Elizabeth Kees. Child Marion Abroad, whose European wanderings have been followed by scores of young readers, and whose sweet ways have endeared her to so many of her American friends returns home, and bids adieu to the pages of *Wide Awake*. Sophie May also concludes her serial story, *Solomon's Seal*. Price's Pocket Book, *The Wedding at Podger's* and the installment of *The Adventures of Miltiades Peterkin* Paul are full of interest and humor. How to

Make a Fire is a capital illustrated description of the different methods employed by savage races to produce fire. Uncle Sam's Almanac is an intelligent description of the nautical almanac, and another valuable paper is one of the series "Poets' Houses," the present chapter being devoted to Thomas Bailey Aldrich. There are several poems scattered throughout the magazine, contributed by Edgar Fawcett, Ella Farmony, and others. One of the most useful things in the whole number is the "Behaving" paper, in which we are told "How to Amuse Younger Children." The Tangled Knots, Parlor Pastimes, and other features are as lively and sprightly as ever, and will doubtless afford amusement for more than one long evening. *Wide Awake* is published by D. Lothrop & Co., 30 Franklin street, Boston.

The *Field and River* is a bright magazine, devoted to woodland, farm and garden, natural history, field sports, boating and fishing and protection of game; published at New Brighton, Pa. Its general appearance is neatness itself, and there has been excellent judgment used in the selection and arrangement of matter.

*St. Nicholas* appears this month in a new dress, designed by Mr. Walter Crane, whose work in the Baby Opera and other charming picture toy books, has made him famous among all nursery amateurs of good taste. The December number has ninety-six pages with fifty-seven illustrations, and the publishers tell us they have printed 100,000 copies, and are going to make happy—we think it's a million children. The frontispiece is a copy of Ittenbach's beautiful picture, *The Holy Family*. Longfellow has a poem, *The Three Kings*, and Bryant has also a poem, *The Mocking-bird and the Donkey*. Miss Alcott begins a serial for the girls, *Under the Lilacs*, and a fine portrait of Miss Alcott accompanied with a biographical sketch appears elsewhere. The boys, too, have their share of the good things, among which we notice a posthumous sketch by Theodore Winthrop, entitled *Rowing Against Tide*, and a Robinson Crusoe fairy story by Gustavus Frankenstein, *The Tower Mountain*. Indeed fairy stories seem to be relished by the *St. Nicholas* public, for here is one by that prince of story-tellers, Lewis Carroll, the author of *Alice in Wonderland*, and another by Frank R. Stockton. More sober subjects, however, receive due attention. Among other papers is one by Gail Hamilton, who disapproves

on Now and Then, or the way little people used to behave and the way they do nowadays. The whole number is a rich Christmas treat, and those boys and girls who do not have a look at it have our sincere commiseration.

"**Thom's PRACTICAL NAVIGATION**," fifteenth edition. This work was prepared for the use of Navigators, by Captain William Thom, the founder of the New York Nautical School, 92 Madison street, from the numerous journals of his voyages to all parts of the world. It has been so simplified, the art of navigation, that the sailor is enabled to become familiar with the practice in the shortest space of time. The various problems in navigation and nautical astronomy are explained and illustrated by diagrams and charts, and all the questions are worked out by inspection in the simplest manner. Rules are given for the guiding of the learner, who is led from simple geography to the highest branches of the art.

—We like to see the College youths taking kindly to **FOREST AND STREAM**. A regular perusal of this weekly record of nature will be of more real benefit to them than any number of readings of the *Iliad* or the *Æneid*. But the two will not quarrel. Educate the body and the mind, and thus produce a perfect manhood.—*Shenango Valley Argus*.

**SAN FRANCISCO CRICKET CLUB.**—The old California have reorganized their club, the new organization to be known as the San Francisco Cricket Club. The officers for the ensuing year are: President, David McGregor, Esq.; Vice-President, S. G. Fonkes, Esq.; Secretary, E. Blakeley, Esq. Managing Committee—Messrs. H. Ogilbe, A. E. Aitken and Henry Warren.

**A WHISKY-LOVING CROW.**—Joseph O'Connor, a retired sea captain, of Fifteenth street, Brooklyn, has a young crow which drinks whiskey as freely as water. On Saturday afternoon O'Connor called "Jack" out of a back room. The crow entered, swinging its glossy black wings and looking inquiringly around. A South Brooklyn politician offered to pay for the drinks for "Jack," and called for the best whiskey. Some old rye was poured into a glass about half filled with it. The crow ran at once to it, dipped in his bill and drank all the whiskey with evident relish. Then it staggered off a few steps and dropped over on its side, uttering a caw of delight. It soon recovered itself and stalked off. Its owner said that it would get intoxicated three or four times a day, and that it seemed to thrive on whiskey.—*New York Sun*.

**PEDESTRIANISM THAT PAYS.**—For twenty-five years Michael Hines, of Lackawanna, Pa., has served as patrolman in the employ of the Hudson Canal Company. His daily task has been to walk a round of twenty miles, and during all this time he has not missed a day. These, finally, aggregate a total of 120,000 miles, and Mr. Hines now returns to Ireland with the snug little sum of \$18,000 in his pocket. This is walking to some purpose.

**DOVE SHOOTING IN LOUISIANA.**—This splendid sport is unknown to all Northern and to many New Orleans sportsmen. As practiced at Bay St. Louis and Mandeville, it is most exciting and puts the skill of the most expert wing shots to the highest test. The writer recently enjoyed a morning's shoot at the former place. These doves are not the solitary cooing turtle doves of the West and North, which are emblems of innocence. They are the ground doves, peculiar to the South, and are a magnificent game bird, as delicious upon the table as swift upon the wing. It frequently flies in small flocks of from five to a dozen, but it often comes darting through the pine tops singly or in pairs. They commence their flight at daylight from east to west along, over and through the tops of the trees that skirt the lake shore in front of the town. At the grayest dawn the "passee" opens and the rattle begins from the breech-loaders of sometimes twenty and sometimes fifty sportsmen stretched in a skirmish line along the beach for a mile at least.

The incessant firing resembles the beginning of a battle. Every passing dove has to run this gauntlet, and so fleet is their flight that a single bird often escapes fifty separate succeeding shots without the loss of a feather, and sails on defiantly to the land of the setting sun. This flight and firing lasts for several hours, when the sport is over for the day. Very expert shots will often make enormous bags, but novitiates frequently fire seventy or eighty shots without bringing down a bird. It is most perfect sport, on dry ground, right in town. There is no fatigue, no following a dog through brush and briars, or getting wet in a blind or marsh. The old Marigny plantation, near Mandeville—now in the hands of Mr. Nott, of the board of health, who is an ardent sportsman—is the choicest spot in the country for this kind of shooting. Two young men recently killed twenty-five dozen doves there in one morning. But this was exceptional.—*New Orleans Times*.

**MESSRS. TIFFANY & CO.,**  
UNION SQUARE, NEW YORK  
City, have made extensive preparations for the approaching  
**HOLIDAYS.**

Their Stock of Diamonds, Watches, Jewelry, Silverware, Bronzes, Pottery, Stationery and Fancy Articles, is the largest and most varied in this country, and includes novelties from abroad and choice goods of their own manufacture, not to be found elsewhere.

A special department has been organized for sending goods to persons at a distance from New York, and any one known to the house, or naming satisfactory references, can have careful selections sent for inspection.

They have lately published a little pamphlet containing a condensed account of each department, and lists of articles appropriate for presents, which they will send to any address on request.

## NEW YORK SHOOTING COAT.

A stylish, handsome Coat. First-class in every particular. Pleasant to wear, durable, and in the end the cheapest.

**MADE OF BROWN VELVETEEN.**

Pockets and lining made to take out, so that it may be worn for early fall and winter shooting. (Horse Smith, Esq., says: "It is my idea of a shooting coat. I have worn them for several years, and would have none other.") Price for Coat, \$25; Vest, \$4.50. Also the best brown corduroy pants at \$10 per pair. I make only the one grade, as the cheapest goods do not turn briars and will not give satisfaction.

Also, in addition to the above, I am making a Waterproof Canvas Suit, cut same style as the Velveteen; goods, not stiff and hard, but soft and pleasant to wear; guaranteed to turn water. Sportsmen who have seen it say it is The Best Yet. Coat, \$25; Vest, \$4.50. I also make the Sleeveless Coat; Vest with sleeves if desired. Rules for measurement and samples sent upon application.

**F. L. SHELDON, Rahway, N. J.**

For Sale by Dealers in GUNS and SPORTSMEN'S SUPPLIES.

**CATS OR DOGS.**

Just the thing for Taxidermists to collect specimens. There is no report or danger attending its use, or any auxiliaries required to operate it. It can be loaded with ease and rapidly. It is extremely simple, and has no delicate parts to get out of order or wear out. For sale by the Trade generally. Sent upon receipt of price or C. O. D.

SEND FOR CIRCULAR.

H. M. QUACKENBUSH, Patentee and Mfr., Herkimer, N. Y.

## Hart's Sportsman's Favorite Metallic Shells. FOR BREECH-LOADING SHOT GUNS.

These Shells are easily loaded, and the caps easily extracted from inside.

Head solid and much thicker than any Shell now made, giving a solid seat for cone or anvil, which prevents it from driving through or springing away, thereby causing miss-fires. The Cone is made of nickel, and fastened solid in its place. Neither rusts nor corrodes fast, like movable anvil made from steel. The Nickel Cone also prevents miss-fire when a cap has been left on shell for a few days, which is liable to occur either in steel or iron. These Shells are finely finished, and made any length ordered, from 2 1/2 to 3 1/2 inches.

Shells and Loaders and Descriptive Price-Lists can be obtained from all the leading Sportsmen's Houses throughout the country.

**GEO. E. HART & CO., Newark, N. J.**

FROM CAPTAIN BOGARDUS, CHAMPION WING-SHOT OF AMERICA.

Messrs. GEORGE E. HART & Co., Gentlemen: The fifty Shells I received from you to-day suit me better than any I have ever used. They are stronger and better in every respect, and I shall use them in all my shooting hereafter.

Yours truly, A. H. BOGARDUS.

## HUBER & MERWIN'S CHAMPION BALL TRAP.

We call the attention of the fraternity to the above trap, claiming to be the *ne plus ultra*. It combines compactness with durability, and is arranged, by a swivel on the bed-plate, to throw a ball in any direction or at any elevation unknown to the shooter, a screen preventing his seeing the direction in which the trap is set.

The spring, as the cut will show, is made of a steel rod or wire, bent spirally at the point of attachment, thus receiving the concussion its entire length, and preventing breakage.

**PRICE \$10.**

FOR SALE BY

**BARTON & CO., Sole Agents,**

337 BROADWAY, NEW YORK.

This certifies that I have used every trap in market, and find the CHAMPION GLASS BALL TRAP, for durability and perfection of its operation, superior to them all, and take pleasure in recommending the "Champion" to sporting clubs and my friends. (Signed)

1581 Third Ave., New York. Nov29 17

## SHONINGER ORGANS.

[PRONOUNCED UNANIMOUSLY AS THE  
**Best Instruments.**

Their comparative excellence is recognized by the  
Judges in their Report, from which the following  
is an extract:

"The B. SHONINGER ORGAN CO.'s exhibit us  
the best instruments at a price rendering them  
possible to a large class of purchasers, having a com-  
bination of Reeds and Belis, producing novel and  
pleasing effects, containing many desirable improve-  
ments, will stand longer in dry or damp climate, less  
liable to get out of order, all the boards being made  
three-ply, put together so it is impossible for them  
to either shrink, swell or split." THE  
ORGANS AWARDED THIS RANK.

This Medal and Award was granted after the most  
severe competition of the best makers, before one of  
the most competent juries ever assembled.  
New styles and prices just issued, which are in ac-  
cordance with our rule, the BEST ORGANS for  
the least money.

We are prepared to appoint a few new Agents.  
Illustrated Catalogues mailed, postpaid, upon ap-  
plication to

**GENERAL GUIDE.**

WITH MAPS AND ILLUSTRATIONS,  
900 pp., Price, \$3.

BY CHARLES HALLOCK,

EDITOR OF "FOREST AND STREAM," AUTHOR OF THE  
"FISHING TOURIST," "CAMP LIFE IN FLORIDA," ETC.

NEW YORK:  
"FOREST AND STREAM" PUBLISHING COMPANY.

The book is a complete manual for sportsmen:  
It gives every sportsmanly method for captur-  
ing every known game animal, bird and fish in  
North America.

It designates the proper charges for guns for each  
kind of game, the various kinds of decoys and blinds,  
and baits and tackle for the fish.

It gives over 4,000 localities where game and fish  
may be found, specifies the game found in each  
locality, the hotel accommodation, and the best  
route to get there. (The preparation of this Directory  
was in itself a work of great magnitude.)

It gives the scientific name and specific charac-  
teristics of each species it describes, with the habitat  
and breeding season of each—a most valuable con-  
tribution to science.

It describes 197 varieties of edible fish alone, that  
may be taken with the hook; 80 varieties of ducks;  
50 varieties of snipe or waders, and the different  
methods of shooting each.

Its instructions for capturing large game are very  
minute, and the chapters on woodcraft, outfitting  
and camping have been pronounced by "El Cazador,"  
of Los Angeles, California, to be simply complete.

Every kind of dog used for sport is designated,  
and his points for bench judgments fully given.  
The chapters relating to selection, breeding, rearing,  
breaking, care and diseases, comprise a seventh  
part of the volume. There are 11 prescriptions and  
recipes given under the revision of the best modern  
canine therapeutists.

It is in itself the most concise, accurate, instructive,  
sensible and comprehensive work ever written  
upon the dog and his diseases. Any physician can  
administer the prescriptions with perfect confidence  
in their safety and efficacy.

It contains very useful recipes and remedies for  
wounds, bites, poisonous illnesses, and emergencies  
of all kinds; for cleaning, repairing, and preserving  
every implement used for sport; for selection and  
use of every kind of boat employed by sportsmen;  
a reference list of several hundred books in request  
by sportsmen, and a directory where to buy outlying  
goods.

It instructs in taxidermy, and tells how to preserve  
and mount specimens of animals, birds and fish.

Gunpowder.

Warren Powder Mills,

MANUFACTURERS OF  
BLASTING AND MINING, SHIPPING AND SPORTING GUNPOWDER.

SPORTING BRANDS—Eureka, Continental "Border Rifle," Snap-shot, and Warren Sporting Cannon and Musket, U.S. Standard. The above can be had of the dealers, or at wholesale at the office, 27 Doane street, Boston, Mass., and of the agents, JOHN P. LOVELL & SONS, corner of Washington, Cornhill and Brattle streets, Boston, Mass. Jy19

HAZARD POWDER CO.

MANUFACTURERS OF  
GUNPOWDER.

Hazard's "Sea Shooting" Powder—Nos. 1 (fine) to 6 (coarse). Unsurpassed in point of strength and cleanliness. Packed in square tins of 1 lb. only.

Hazard's "American" Powder—Nos. 1 (fine) to 3 (coarse). In 1 lb. cans, 5 and 6 1/2 lb. kegs. A fine grain, quick and clean, for upland prairie shooting. Will adapt to shot-guns.

Hazard's "Duck Shooting" Powder—Nos. 1 (fine) to 5 (coarse). In 1 and 5 lb. cans, and 6 1/2 lb. kegs. Burns slowly and very clean, shooting remarkably close and with great penetration. For field, forest or water shooting, it ranks any other brand, and it is equally serviceable for muzzle or breech-loaders.

Hazard's "Kentucky Rifle" Powder—FFFG, FFG, and "Sea Shooting" FG, in kegs of 25, 12 1/2 and 6 1/2 lbs, and cans of 5 lbs. FFG is also packed in 1 and 1/2 lb. cans. Burns strong and moist. The FFG and FFG are favorite brands for ordinary sporting, and the "Sea Shooting" FG is the standard Rifle powder of the country.

Superior Mining and Blasting Powder. GOVERNMENT CANNON & MUSKET POWDER; ALSO, SPECIAL GRADES FOR EXPORT, OF ANY REQUIRED GRAIN OR PROOF, MANUFACTURED TO ORDER.

The above can be had of dealers, or of the Company's Agents in every prominent city, or wholesale at our office, 38 WALL STREET, NEW YORK.

THE

New Dittmar Powder.

THE CHAMPION POWDER OF THE WORLD For all off-hand shooting at short and long ranges. Unsurpassed for Cleanliness. Pleasant to shoot on account of little recoil and report. Desirable for hunting on account of little or no smoke. Unequalled for rapid firing, as it does not foul and need up the barrel as black powder. Great accuracy, penetration and good pattern. Safer than black powder. Address

N.Y. Newspaper Mailing Agency

With the latest Improved Newspaper Folding and Mailing Machines, No. 13 Spruce street.  
JAMES BRAD Y, Manager and Proprietor

Sportsmen's Goods.

THE

"Boston Shooting Suit"

Is manufactured only by

G. W. SIMMONS & SON,

BOSTON.

Flexible, Waterproof, Tan-Color, Duck.

Each article—coat, trousers, vest and hat—have the name and manufacturer's address stamped upon it, and no suit is genuine without it bears this imprint.

The suit can be sent, securely packed, by mail to any part of the United States or Canada on receipt of \$1.25 above the price of the suit.

We make no discount except to the trade. We make but one quality, and that is the VERY BEST. The price of the suit complete is \$13.

The suit consists of coat, trousers, vest and choice of either cap with havelock, or hat.

The material is of the best quality of duck, waterproofed by a patent process. The color is that known as "dead grass shade."

The seams and pocket corners are copper riveted, and nothing is neglected to make the whole suit complete in every way.

This is what one of our best sportsmen says of it, writing from camp: "Miserable, drenching rain, pouring down in a perfect deluge, as if a second flood had come upon the earth, two portages to cross, and a swamp between them; that was the prospect before we reached our camping ground. Such a swamp, too; almost impassable, for where the ground was firm was an almost impenetrable thicket of thorns and what not, that looked as if it would tear you to pieces. Well, we got to our camp, and I must confess I was agreeably surprised on my arrival. Although I had been nearly eight hours under incessant rain, laboring and striving along under the adverse circumstances above mentioned, yet I found myself comparatively dry, and my clothes without a tear. For the benefit of our brother sportsmen, let me advise one of Messrs. Simmons' (of Boston, Mass.) Waterproof Suits. Oh! what a relief it was to find one's tobacco was dry, and that one could light a pipe; that you could laugh at your miserable friend, who stood shivering and shaking as if he had the palsy; and then, next morning, oh! what fun it was to see him mending his clothes, while I had not a tear to complain of. Ventilation, also, that great bugbear of waterproof suits, is legislated for in the most ingenious manner. No sportsman should fail to supply himself with a suit which is at once cheap, practical, and will last an almost indefinite time."

Our New Overcoat—The  
"Plevna,"

Water-proof, Mildew-proof and Moth-proof, is attracting great attention. It is made and sold only at Oakhall, Boston. The price is \$13.

It is a long overcoat made to wear to cover, or when driving or walking in stormy weather. It is perfectly waterproof, thoroughly ventilated, and just the garment that every sporting man should have.

Our Leather Jackets and Vests

are the great wind protectors. They are made from soft, pliable black leather, fannel lined, and sell at \$9 and \$7.

Our Flexible Tan-Colored  
Waterproof Leather Coats  
and Breeches

are considered the finest things ever made. They sell at \$23 and \$15.

An illustrated circular, containing full description of each garment, with sample of the material from which made, will be sent free on application.

FOR  
ACUTE AND INFLAMMATORY RHEUMATISM, GOUT, SCIATICA, LUMBAGO, and Severe Cases of Bodily Pain.  
AN INFALLIBLE CURE.

Innumerable Testimonials from prominent citizens as to the wonderful curative properties of Prairie Oil will be furnished on application.

PRICE FIFTY CENTS, ONE AND TWO DOLLARS PER BOTTLE.

SENT BY EXPRESS ON RECEIPT OF PRICE.

Manufactured by "THE PRAIRIE OIL CO.," 132 Nassau St., N. Y.  
AND SOLD BY DRUGGISTS GENERALLY. (P. O. BOX 2,997.)

"About two years ago I was first attacked with Rheumatic Gout, and after intense suffering and great expense from medicine and doctors' bills, without obtaining relief, I procured Prairie Oil, and in less than three days after the first application was enabled to walk to my office, a distance of three miles, although previously confined to my room for nearly five weeks. From that time to the present I have never been without the oil, nor have I ever applied it in vain, notwithstanding so lengthened a trial. My family use it for any of the complaints it is intended for, and consider it invaluable. H. F. WILBARTINE.

Mr. M. PADDON, tobacco merchant, 992 Fulton street, Brooklyn, lost the use of his right leg by Sciatica, got relief at once after first application of PRAIRIE OIL. This gentleman had become so depressed by his affection that he had given up all hopes of recovery.

Says the Proprietor of Niblo's Garden, New York: "PRAIRIE OIL gave me relief from inflammatory rheumatism after first application; and after the third I had no further use for my case."

Mr. KENWARD PHILL, Dramatic Editor Brooklyn Eagle, Brooklyn, was unable to walk without the aid of crutches, owing to a severe attack of Rheumatism. After the third application of PRAIRIE OIL the crutches were thrown aside, he having no further use for them.

# FOREST & STREAM & ROD & GUN

THE AMERICAN SPORTSMAN'S JOURNAL.

Five Dollars a Year.  
Ten Cents a Copy.

NEW YORK, THURSDAY, DECEMBER 6, 1877.

Volume 9.—No. 18.  
[No. 111 Fulton St., N. Y.]

For Forest and Stream and Rod and Gun.  
JACK.

COME, Jack, let's have a show,  
Act like a little man;  
As dog you're something more, you know,  
Than black-and-tan.  
That's it, now sit straight up,  
You bark, and I'll translate;  
We'll prove there's one knowing pup,  
As sure as fate,  
Shake hands. Ah, that's the style!  
It pays to be polite;  
You'll find it always worth your while,  
To black or white.  
Now tell how old you are?  
Two barks—that means two years—  
And for your age you're quite a star,  
As now appears.  
How does the beggar go—  
The underserving imp  
That stole your meat and bread, you know?—  
That's just the limp,  
From man to man he'll beg,  
And lie to every one,  
Until you bite his wooden leg,  
That makes him run.  
How do the ladies go?  
Well, Jack, that's just the way;  
They wriggle and twist to catch a bean,  
And love a day.  
What says the candidate?  
A long-drawn bark and growl;  
That means they talk about the State,  
And make "Rome howl."  
How does the coward act  
When he begins a fray?  
Like that, he turns with wondrous tact,  
And sneaks away.  
What does the man of grit,  
When serious times begin?  
You're right, he never backs a bit,  
But goes right in.  
Now, Jack, we're through to-day,  
Just tell me if you like me?—  
A lively leap and bark, and they  
Mean yes, sir-ee!  
You may well say he's smart;  
His life's an honest deal;  
All right, a dog, his little heart  
Is true as steel.  
Ah, Jack, if we could trust  
The world as I trust you,  
No man to man would be unjust,  
No love untrue.

J. C. BURNETT.

For Forest and Stream and Rod and Gun.

## Catchings from the East Coast of Florida.

BY THOMAS SEDGWICK STEELE.

NEW SMYRNA, on Mosquito lagoon, east inland coast of Florida, contains about five or six houses. The town was settled in 1787 by fifteen hundred Minorcans under one Dr. Turnbull, but through his brutality, and the colonists not being dealt with according to contract, they abandoned the settlement, and located in and near St. Augustine, where their descendants now reside. The town was named New Smyrna, in compliment to Turnbull's wife, she being a native of Smyrna, Asia. The Minorcans cultivated annually immense quantities of indigo. Sauntering out through the palm groves, I discovered two old tombs, supposed to cover the remains of Spanish noblemen. For miles around the country is drained by deep and well formed canals, the only permanent monument to Turnbull's activity. They are almost as perfect as when first constructed, and drain large swamps in the vicinity to the lagoon, or Hillsboro River, as it is sometimes called—the upper part of the lagoon being Hillsboro River.

About two-thirds of all the visitors to Florida return down the St. Johns River after reaching Enterprise, but further up the river, or inland, are greater delights, and only through the means of "camp life" does one really enjoy this beautiful country.

The unfortunate state of the road (thirty miles in length) lying between Enterprise and New Smyrna, debars many from leaving the highway of travel, but once over the difficulties, one is well repaid for the undertaking.

By the means of a team of mules and a rough box wagon, containing our guns, rods and camp equipage, we started from Enterprise for New Smyrna early one morning, and of all the roads we traveled while in Florida, this would have taken the first prize for wretchedness. It had recently rained, and it would be safe to say that more than one-half of the road was under water. Frequently, as far as we could see backward and forward, the water covered the road, reaching to the hubs of the wheels, and sometimes to the floor of the vehicle, while about us were the gloomy pines of the southern forests. At short intervals the path was sandy, and then we jumped out and rested our limbs by walking, for the wagon was only just able to accommodate our trunk, which we used also for a seat, hanging our feet over the sides. Our dog occasionally came to a "point" on quail, but the thick undergrowth of palmetto and Spanish bayonet plants forbade us to follow; besides, it soon commenced to rain and we hastened on our journey.

Just before entering New Smyrna the road passes through a large grove of palm trees, their long, graceful leaves entwining above, and overhanging the path. Pleased with this display of tropical foliage we moved onward, and soon drew up at Lowd's Hotel, and were welcomed by about a dozen lovers of the rod and rifle, who, clad in hunting suits of various colors, were grouped around a blazing fire on the hearth, the mercury still standing at 50 degrees. This hotel and its accommodations, we can safely say, is the most homelike of any it was our good fortune to meet while in Florida (Jacksonville excepted), and for the friends of out-door sports, offers facilities not to be found elsewhere. The hotel is a large two-story house, the garden in front reaching down to the lagoon. The table is well kept, "hog and hominy" not being the principal dishes, and everything from beefsteak down is not fried, which cannot be said of all the hotels on the St. Johns River.

Fine oysters in every style of cooking, venison, turtle steak and soup, quail, a great variety of fish, to make no mention of that rare article, good bread and butter. The board is only fifteen dollars a week. Mr. Kirby Lowd, the proprietor, always accommodating, and there is not that desire to reach one's "bottom dollar" evinced by hotel keepers and steamboat men in the interior portions of the State. At Enterprise oranges cost the tourist fifty cents a dozen, but the same fruit was brought over to this place by a some "underground railroad," and sold for thirty cents a dozen, very few being raised on the place. A number of the sportsmen's wives were stopping at the house, and the whole place had an air of true comfort. But communication by means of sail boats with St. Augustine (or civilization) is more frequently resorted to than by the above mentioned route.

New Smyrna was shelled and burnt repeatedly by our gunboats during the late war, and the rebel earthworks still remain, while on the wharf, dismounted, lies a small cannon, stamped "Chicopee, Mass.," which was used in the siege. Mr. Lowd, the proprietor of the hotel, after having his house burnt over his head, retired with his family some three miles to the country, and on lighting his first fire was shelled out of his temporary encampment. He afterward served as colonel in the confederate army.

Excellent fishing can be had at this place. Sea bass, turbot, drum fish, to say nothing of the excitement of shark fishing, and one of our party caught in two hours twenty-five of that savory fish called sheephead, one day being considered great luck on our northern coasts. Boats and guides are to be had without trouble, while any article wanting in one's accommodations is readily supplied by the ever-generous sportsman. Deer are to be had on many of the islands in this vicinity, and are "jumped" by hounds, the deer being "flushed" in the same manner as birds. We enjoyed one day of raccoon hunting; the last animal captured having a lively fight with our dogs.

Of all the undergrowth over which a sportsman is obliged to travel, Florida will take the foremost rank. What with cactus, Spanish bayonet plants, to say nothing of shrub palmettoes, our clothing after the hunt appeared as if it had been cut with the sharpest of knives.

We shall remember for a long time our quail hunt in the saddle, for in this way a greater part of the shooting is accomplished. Our heavy Mexican saddle was surmounted by a big pommel, and drove a close competition to the size of the horse, leaving but little of him in sight. The bridle was composed of stray bits of various colored leather, tied together with string, and the reins were of rope, while with our feet, almost touching the ground, we set off on our hunt. Did the reader ever attempt to carry a gun in the saddle for the first time, with the horse on a lively gallop? We thought it would be easy, but somehow the barrels and stock grew longer and heavier at every jump of the animal. We carried it over our shoulder, then under our right arm, until we were able to take oath to the exact number of bones and muscles each contained. Across the pommel was of course the place to rest it, but the extent of that article left room for little else. We met on our way to the hunting grounds a horse and cart fully occupied, by a "Cracker" and his family. On the back of the horse was a child, while on the palm leaves which covered the bottom of the vehicle reposed his lordship, wife, and three other children. Over the shrub palmettoes which reached to the horse's breast we galloped, and placing some two miles between us and the village, we brought up at an old sugar mill, built by Turnbull over a hundred years ago. Its composition was Coquina rock, and in ruins, but what still remained of its ancient walls overgrown with lovely ivies, yellow jessamines and running vines, gave it a picturesque effect not soon to be forgotten. Tall palm trees reared their lofty trunks from its interior, and my companion remarked that "he had been led astray many times while abroad to visit celebrated ruins, not half so artistic." From this we turned into one of those swamps or savannas as they are called in the South, and our dog soon pointed on the edge of a thicket our first bevy of quail. Dropping from our horses, and throwing our reins on the ground, which was sufficient to detain the animals, we flushed the birds one after another, and secured eleven for our bag, one of them being shot on the wing after remounting on our saddles, the horses standing as still as if petrified. Retrieving birds without a dog is impossible in Florida on account of the heavy underbrush, and with the best of his species we lost two that day.

The next day was the Sabbath, and engaging a missionary who happened to be in the vicinity, we had service at the hotel, our top boots and hunting suits not detracting from our full enjoyment of the exercises. A small wooden building costing fifteen hundred dollars has been constructed, and is used as a church and school-house, the funds being largely contributed by sportsmen who frequent the place annually.

After a few days of rest at New Smyrna we made preparations to sail for our Eldorado of Florida—Indian River. Hiring a small schooner-rigged sail-boat, we loaded it with provisions of the best that could be had at New Smyrna, but the variety was limited. Hard tack, salt pork, rice, coffee, sugar and condensed milk was the extent, relying on our guns to help out the larder. My guide was a six-footer, who (as was fortunate) had lived four years on this mysterious Indian River, knew every island and point, and alone with him I set sail. From Mosquito Lagoon we beat, tacking in and out through its many channels, shooting a few ducks on the way, and reaching the "cut-off" about noon. This cut-off connects Mosquito Lagoon with Indian River, and is a half a mile in length. It was built by the United States Government during the Seminole war of 1835, and through it passed the supplies to the forts of the Indian country. At the present time the water is very shallow, the walls having crumbled in, and it does not allow boats drawing over seven inches of water to pass. The channel is cut through solid walls of shell concrete, which arise on either side some twelve feet, and it is only eight feet in width, but with my guide in the water pushing, and the help of my own hands on the rocky sides, we effected a passage. A boat of larger build had only just preceded us, working for three days a channel with pick and ax, and the sides of the vessel, which we afterward observed, were in a sadly damaged condition. From the cut-off we entered a large bay twenty miles in width, and which is really the head

of Indian River. It was a lovely bright day, the thermometer at about 80 degrees in the shade, and we enjoyed to the fullest extent the delightful sail across the water to Titusville, which is located on the west shore. Near this place is "Dummett's Grove," celebrated the State over for its fine oranges, very few of which are shipped to the north. This fruit, though small, is deliciously sweet, with a very thin skin, and they are known in the market as "Indian River oranges," and it is from these and "sick Yankees" that the Floridians nowadays make most of their money.

(To be continued.)

For Forest and Stream and Rod and Gun.

## THE EDITOR'S GROUSE HUNT IN MINNESOTA.

**H**ALLOCK was expected in St. Paul, and what was to be done to entertain and amuse him was a question, previous to his arrival, often discussed by the sportsman's fraternity of our city. It was but natural that we should wish to do him honor and make his stay among us as pleasant for him as the circumstances would permit, for we all felt a debt of gratitude due to the Editor of the *FOREST AND STREAM* and *ROD AND GUN*, the author of the "Sportsman's Gazetteer," and this feeling, I dare to say without fear of contradiction, is shared by every true sportsman in America. Several projects were under consideration, and all agreed that in the first place he must have a day or two with the prairie chickens; for a sportsman visiting Minnesota in August or September without making the acquaintance of *Oxydion cupido* and *Pedisces phasianellus*, would be as bad as for a pilgrim to come to Rome without seeing the Pope—so a grouse hunt must be.

After the arrival of our distinguished visitor, and proper greetings and hospitalities, off we started for the prairies, the Editor, "Doc," W. and I. "Doc," is our leading sportsman, *primus inter pares*, with the best of everything desirable for a hunter's outfit; guns, dogs, boats, hunting-wagon—himself the closing link in that long chain of first-class sportsmen of which St. Paul is justly proud.

At 3 o'clock p. m. on the 13th of September we left our city by the St. Paul and Sioux City Railroad. This most excellent thoroughfare binds together St. Paul with the Missouri River, and farther on by the Union Pacific, with California. After crossing the Mississippi and passing Fort Snelling, we entered the beautiful Minnesota Valley, famous for its rich natural meadows, in the midst of which a narrow belt of timbermarks out the meandering water-course, of which here and there we had passing glimpses. Thus we sped on for hours; on our right an uninterrupted carpet of the richest verdure, but on the left higher ground, with stubble-fields and farmhouses, until by sunset we entered a belt of heavy timber, a branch of the "big woods," which here crosses the Minnesota River, and in a southeasterly direction stretches through the country almost to the boundaries of Iowa. Darkness soon obscured the view, but our snorting iron steed carried us safely through the thickening gloom to our objective point, Madelia, a small village and station, which will always retain its page in the history of Minnesota as the place where the closing scene was enacted in the grand chase of the Northfield robbers; for in a willow thicket on the bank of the Watondan River near this village the tigers were bearded in their lair, one killed, and the remainder, the three Younger Brothers, captured alive by a few brave Minnesotans.

We arrived rather late in the evening. By the thoughtfulness of "Doc," his famous hunting wagon, already described by the editor in his hunting notes, was in waiting at the depot and carried ourselves and baggage to the village inn, where comfortable quarters and an excellent supper had beforehand been ordered and was ready. To this we did ample justice, and after a hearty meal our friends left and quartered we retired to rest. I have scarcely forgotten to mention that besides guns, ammunition and commissary stores, we brought with us two brace of setters, "Doc," his two magnificent thoroughbred English, and Gordon bitch of the bluest blood, and I my imported Irish setter Rover, which is good enough for me.

After an early breakfast we were off for the hunting field, which was about six miles distant. The day was not such a one, as you would select for a grouse hunt on the prairies. It was very hot and sultry with a strong wind, almost a gale, blowing from the south, and there was not a particle of moisture in the ground. Proceeding a few miles at a rapid rate behind a span of splendid horses belonging to our landlord, we came suddenly to a stop by the discovery that the ring on one of the wheels was loose. This seemed rather perplexing at first, but had we not with us the author of the "Gazetteer," and was he not equal to the emergency? Out of one of the many pockets of his hunting coat he extracted a roll, which was found to contain a small hammer, a pair of diminutive tongs, some annealed wire, a few nails, screws, and many little tools and odds and ends. The wire was firmly wound around the wheel on two or three places and fastened, and the injury mended in less than no time. And now it would follow in order, to describe the editor's famous hunting coat, from one of the receptacles of which the above useful bundle was taken, but I feel and confess my inability to do justice to the subject. Was it a coat, or was it a conglomeration of pockets? It was, in fact, very much of pockets and very little of coat. The former by all means predominated. Pockets in front, pockets behind, pockets above and below and every where; each one containing some useful article which, according to the "Gazetteer," ought to be on a sportsman's complete outfit. Any one who may wish to inspect this remarkable garment can doubtless find it hanging on the wall of the *FOREST AND STREAM*'s sanctum, where it ought to have its place, rescued as it was, on a later occasion, "from a watery grave."

After the mending of our wheel by the dexterous hand of the editor, we continued on for a mile or two more, and then left the wagon and commenced scouring a stubble field. The editor and "Doc," to the left, and I to the right. My dog was the first to find game, but as he came down the wind which was blowing hard at the time, he did not feel the presence of the birds before he was in the middle of the gang. The whole

covey rose and scattered, some going straight ahead toward the south, others lighting in a corn field to our right. My friends followed the former, and I the latter, which I was successful in finding. My dog worked finely, and in a short while I had bagged three or four birds, large, plump and fully grown; then all of a sudden my dog disappeared. I looked for him all through the corn, called at d whistle, but could not find him anywhere. At last I went out on the adjoining prairie, and here, at a distance of fully a mile, I noticed poor Rover running like a deer, backward and forward in every direction. From some cause or other he had lost me in the corn field, got bewildered, and was apparently hunting me instead of prairie chickens. I took to the wagon and made the driver bring me up to the dog, and when I came up to him he was so overheated and exhausted, being rather too fat for hunting in very warm weather, that he could hardly move. His hind limbs seemed partly paralyzed, and the poor animal was in great distress. Fortunately we had plenty of ice, and by holding a big lump on his head, and giving him ice water in small quantities he gradually recovered; but he was *hors de combat* for that day and was consigned to the kennel in the rear part of the wagon. I was very much annoyed by this mishap, and remained for an hour or two with my dog administering to his wants. In the meantime my companions had found another covey and bagged quite a number. I now joined them, and for the rest of the day we all three shot over "Doc's" sisters.

In another corn field we soon found a large gang of birds, of which at the first flight we brought down three; but they were very wild, rose all at a time and disappeared behind the high bank of an adjoining creek. For a long while we hunted for them in vain in the bottoms, on both sides of this and in the willow thickets on its banks, but finally, farther on in some very high grass we found them again, and for a few minutes the firing was quite lively, with tolerably good results. It was now nearly noon and intensely hot, the thermometer surely up among the nineties, and we concluded to have our luncheon and some rest, for which purpose we repaired to a farmhouse near by, and spread our commissary stores on the shady side of a big haystack. Our lunch basket contained among other things, canned salmon and Delaware grapes, and for beverage some very excellent bottled beer, of all of which I for one partook very freely. And hereby hangs a tale, of which more anon.

After luncheon, smoking and resting to our heart's content, we resumed our hunt in the direction of Madelia, but taking a somewhat more easterly course. In a cornfield close by our resting-place we found a few scattered birds which we bagged, our editor displaying here some very fine marksmanship; and I may as well here remark that, as far as I remember, I think he hardly missed a bird all day long. After this, for a distance of two or three miles, we did not find a single bird, but made by this time a very unpleasant discovery—the editor's famous hunting coat, above referred to, was missing, and with it his gold watch and chain, nearly all his shells, and many other useful and ornamental articles too numerous to mention. Stars and stripes! It was gone sure enough; had slipped down from the wagon somewhere on the prairie between us and our late resting-place, some three miles distant. Here was a pretty go! but an attempt must be made to recover the lost property, and as the driver thought that he might be able to follow the wagon track back over the prairie, he and the editor retraced their steps with the wagon, while Doc and I proceeded onward on foot towards a certain point, where they were to overtake us.

They had not long been absent when I commenced feeling quite sick, probably the consequence of too freely indulging in salmon, grapes and lager-beer; apparently it was a case of cholera morbus, or something very much like it. I suffered quite severely, and sat down to rest at a fence. "Come, come, John," called out Doc, "never mind cholera morbus, look at the dogs. We will kill a dozen birds before the editor returns." And sure enough, his setters had made game in a patch of grass and came to a most beautiful point, crouching very low, tails extended, eyes glaring, nostrils working; there they stood as cut in marble, a most charming sight. How we wished we had our friend Zimmerman there to take the picture. Sick as I was I snatched up my gun and joined Doc. On we went ahead of the setters, who refused to move a single step; we expected every moment a rise of at least twenty birds, and we found—a big mud-turtle quietly marching along a narrow cattle path. "D—m turtle," broke out Doc, in disgust, and gave it a vigorous kick. This was exceptional and very unusual in Doc, for he is a very polite gentleman, a church member, and not known to indulge in profane language. But then, fancy the provocation! Expecting a score of chickens and finding a mud turtle. 'Tis enough to make a saint profane.

A little further on we found and killed a couple of chickens; but after that I stayed behind, feeling very sick and distressed, and waiting for the editor and the wagon to overtake me. There I sat for more than an hour wishing very much I were at home and "in my little bed." But at last came the editor, the wagon and relief. The lost garment with all its contents was found not far from our luncheon place, and the editor, hearing of my illness, told me at once that remedy was on hand. His coat, among other things, was provided, it seems, with a drug store, and up came from one of its innumerable pockets a small vial, from which the editor kindly administered forty drops in a tablespoon of water. It acted like a charm. Here it is for the benefit of the reader:

Laudanum, capsicum, spirits of camphor, peppermint and Hoffman's anodyne, in *partibus equalibus*; detur, thirty drops for people in general, but forty for a grousehunter, brought to grief by canned salmon and Delaware grapes. *Probatum est.* Although out of pain, I felt very weak and concluded to stay in the wagon for the rest of the afternoon. But the editor and Doc had pretty good shooting, finding quite a number of birds on the way back to Madelia, where we arrived just in time for supper. Our bag contained 46 grouse; and although it was less than we had expected, it was not so bad after all, considering the weather and our several mishaps. It was our intention to have one day more among the pinated gentry; but when we rose early the next morning a storm was brewing, and the sky looked all around very threatening. We decided therefore to take the morning train for St. Paul, which we did; but when we passed through the big woods the sky had cleared up a little, and the editor and Doc made up their minds to stay there until the evening train and try their luck with the ruffed grouse. So I left them there and continued on to St. Paul, reaching my home just as the storm broke loose. Meeting my friends the next morning, they reported as the result of their stay in the big woods: six ruffed grouse and a thorough wetting.

Here ends the simple but truthful tale about the editor's grouse hunt in Minnesota, in which the prominent points seem to be a loose wheel ring, an overheated dog, a wonderful hunting coat, cholera morbus and a mud turtle.

J. S.

## HUNTING IN SULLIVAN CO.

The Beaverkill region of Sullivan County, famous not only for the rare trout, but for the streams afford the angler, even in the fall, fishing within respectable distances of the city, to be not much more than a mere day's ride, and secure ridges where the deer are numerous. There is a section, however, of the State, which is a killing and civilization, which has surprised everybody that is fully as prolific in all that the sportsman desires as those that made Nimrod so mighty. The town of Bethel, in Sullivan County, has surprised everybody this year with the excellent hunting it has provided. Deer are plenty; so many bear have not been seen since the days of the prairie hunters; and as to partridge—beg pardon, grouse—and the smaller game, the woods have been full of them.

Dave Avery and Billy Beemer, of this place, came in from Smith Schoonmakers a few days since. Smith keeps a "sportsman's rest" ten miles from here, in Bethel. They met two other sportsmen there, and were absent two days. The party killed five deer, all the finest kind. Parties from Newburgh, Paterson, and other places, have been equally successful, and twenty deer have been brought into Monticello from Bethel since the season opened. Nearer Monticello the grouse shooting is unsurpassed. Dave Avery, of the Mansion House, who is equally at home behind setter or deerhound, or in hand-to-hand contest with bear, says that the lover of grouse shooting could never find better sport than can be had within three miles of Monticello. Every day brings parties in from the surrounding country to enjoy the sport. Monticello is the centre of the White Lake, Black Lake, Sacket Pond, and other wild hunting regions, and I know of no more convenient locality or one that gives better promise to the sportsman than this same section of Sullivan County. The writer has just returned from a week's stay in the section, and knows whereof he speaks. From Monticello one is in easy reach of the Beaverkill region also.

Three deer were killed last week by local hunters, six miles from Monticello. One was an enormous buck from the Far-through ridges. The same week, local hunters ran a buck, a doe and a fawn into Sacket Pond, and got the buck. The other two escaped. There is a party of New Yorkers at Black Lake at the present writing. They had captured a fine deer, and had a bear chase with an unsuccessful ending, however, at last accounts.

Monticello has five trains from New York via Erie Railway to Port Jervis, then by Port Jervis and Monticello Railroad. Sportsmen visiting this region by going to the genial Sheriff Morris's mansion house, will find everything pleasant, and be furnished full information as to hunting grounds, etc.

## Fish Culture.

### HISTORY OF SALMON CULTURE IN PENNSYLVANIA.

(From the Easton Free Press.)

ON October 26, 1870, the first black bass, about 450, from Harper's Ferry, were placed in the Delaware, just below the Lehigh Dam. The project was suggested and urged by the late Thaddeus Norris, and the funds for the purpose were raised by him and by Howard J. Reeder, Esq., and G. W. Stout, Esq., these latter raising in Easton \$313, and Mr. Norris about \$1,000 in Philadelphia. The remainder of the funds not applied to bass (about one-half) was then applied by Mr. Norris to the experiment of stocking our waters with salmon. It had occurred favorably to him that salmon would live and thrive in waters of the purity and temperature of the Delaware and its tributaries.

In the winters of 1870-71 Mr. Norris made arrangements with Mr. Christie, who owned a hatching establishment in Dutchess County, N. Y., for the purpose of this experiment. The late Henry A. King, conductor on the Central Railroad of New Jersey, an enthusiast in fish culture and angling, took a deep interest in these experiments, and he, with Mr. Christie, personally superintended the bringing of the salmon fry to Easton, where they arrived with them on Decoration Day, May 30, 1871, an exceedingly hot day. They brought about 2,000 salmon fry, about one and a quarter inches long. Owing to the great heat of the day and the long journey, one hundred and fifty miles, and the lack of experience at that time in transporting fry, they arrived in a bad condition, only 2,000 being alive out of many thousand, and most of these in a very weak state.

Mr. George W. Stout, who carried out all the details of Mr. Norris' suggestions, with the aid of B. H. Christie and his brother, Leonard D. Christie, deposited the fry, on the evening of their arrival, a part of them in the spring of the late Paul Rader and the remainder in Benjamin Lerch's spring and John Lerch's spring. These springs are all large and situated on the Bushkill, about four miles above Easton. As these fish were in such bad condition when deposited that it is not known if any of them lived, the experiment was considered unsatisfactory.

The project was then conceived of bringing the eggs from Canada and hatching them on the ground, and 12,000 eggs were received from Mr. Wilmot, Newcanale, Ontario, part of which were whitefish, by Mr. George W. Stout, on April 4, 1872. On April 6th Mr. Stout, Mr. Thad. Norris and Mr. H. J. Reeder, placed the eggs in hatching boxes, previously prepared in the fine spring of Jonathan Fly, about a mile west of Easton.

The salmon were very successfully hatched out under Mr. Fly's supervision, but the whitefish was a failure. These salmon were placed in the large spring by the Bushkill, immediately below Yoho's upper dam, by Messrs. Stout, Norris, Mark Warner and Mr. Fly. To make the experiment more conclusive, hatching boxes were prepared, after Mr. Norris' model, and placed in Mr. Heitzman's spring on the Delaware, two miles above Easton, and on the 23d of March, 1873, the same party placed in the boxes 40,000 salmon eggs from the hatching establishment of G. C. Atkins, Bucksport, Maine. These were hatched out not so successfully as those by Mr. Fly, but probably one-half survived and were placed in the Delaware.

These experiments were the result of the private enterprise of the persons named, and all salmon propagated were of the *Salmo salar*, or true salmon of the St. Lawrence and Northern Europe. The private enterprise of these gentlemen was then merged into the labors of the Fish Commissioners of Pennsylvania and New Jersey, and we trust that our Commission will be more liberally encouraged by appropriations than heretofore, in view of the facts that salmon culture in our rivers seems to be crowned with success.

**SALMON IN 1852 IN THE SUSQUEHANNA.**—**EDITOR FOREST AND STREAM.**—I found a newspaper cutting which I copy for you: "1852. June.—A salmon weighing upward of two pounds was caught in the Susquehanna, near Danville, some days since." I think that the Delaware and Susquehanna rivers are better for salmon rivers, and that this fish would thrive there better than in the Hudson, but the matter of fish ladders over dams ought to be attended to. I may add that sawdust thrown into rivers and sinking, water-logged, to the bottom is death to salmon. I heard this stated on the small rivers, Metis, Rimouski, R. du Loup, Des Trois Pistoles, etc., that empty into the St. Lawrence from the south, in 1840, while on the Northeast Boundary Survey. There are no salmon in these rivers of any consequence on this account. Maybe it is because they all have natural falls that the salmon cannot leap. We got a few salmon in the Metis near the falls (some 40 feet high and near its mouth) and as many as we could use for a party of thirty men, in the basin below the falls, which probably were only looking in for a chance. In the Lake Metis, 40 miles from the St. Lawrence, we got quantities of *Logrus* or *salmo amethystus*, from 6 to 18 pounds, on the spawning grounds in September.

Yours truly,  
J. CARSON BREYVOORT.

**GENEVA LAKE, Wis., Nov. 22.**—On last Thursday there were received here 500,000 salmon trout eggs for N. K. Fairbanks. This is the third season that Mr. Fairbanks has pursued fish propagation upon a large scale. He has deposited in Lake Geneva nearly 9,000,000 young food fishes, as follows: In 1875, 17,000 Oswego bass; in 1876, 250,000 salmon trout, 112,000 whitefish, 50,000 brook trout, 1,500,000 wall-eyed pike, 20,000 California salmon; in 1877, 1,000,000 salmon trout, 100,000 whitefish, 4,500,000 wall-eyed pike, 100,000 California salmon, 108,000 brook trout. For this season he has successfully hatched 200,000 California salmon, which are now lively minnows an inch in length, and he will receive large quantities of fish eggs within the next few weeks. Wisconsin has an appropriation for this season for fish culture, and the State hatching-houses at Madison and Milwaukee are now in successful operation under the charge of Prof. H. W. Welsh and Bari Scott, formerly of this place. There will be propagated at the two houses this season 5,000,000 each of whitefish and salmon trout, besides 160,000 California salmon, and considerable quantities of brook trout, etc.—*Wisconsin State Register*, Nov. 29.

—The recent floods in Virginia washed a great many bass out of the James River. The State Hatching House at Lexington was much endangered, but the water did not finally cover the floors to a greater depth than five inches. The hatching troughs are two feet above the floor. Fish Commissioner Henry B. Nicholas has sent us two fish from the hatching of the California salmon—always an interesting monstrosity, but by no means rare. The fish are joined at the middle of the bodies, and have one umbilical sac in common. The salmon fry, we are glad to learn, turned out remarkably well.

**SALMON IN CATUGA LAKE.**—**Editor Forest and Stream.**—Three years ago last February the Game Club here let loose a considerable number of salmon fry in the Inlet, some four to five miles above Catuga Lake. We have heard of a strange fish being caught up the Inlet by persons drawing sucker nets, but they devoured what they caught and kept mum. On Sunday last, however, a fish floated up in the lake nearly dead to death by a lamprey eel. He was picked up, and found to be a genuine Kennebec salmon, eighteen inches long, and weighing at a guess three and one-half pounds. The fish was sent to Monroe or Seth Green for identification. There are living here and hereabouts some oldest inhabitants who remember, and have caught the great salmon, that before the Erie Canal and the Oswego dams used to make their way from the sea to this very Inlet. Some of them have seen this fish, and immediately pronounced it a true salmon. Now the great question is, will these fish breed here; running up the Inlet to the lake for that purpose, and falling back into the lake as they do into the sea elsewhere? Or is this one of the fry put in here three years ago; and has it been to the sea and got so far back, seeking the place of its youth? It is considered here that the dams and the canal have long ago sealed access from the sea.

Utica, N. Y., Nov. 25, 1877.

## Natural History.

### THOSE MIGRATORY QUAIL.

WE are at a loss to conjecture through what inadvertence all that has been done by the sportsmen of Boston, and Rutland in introducing to our bird fauna such an interesting addition as is the migratory quail of Europe was overlooked. It is true that when the articles in question appeared in *FOREST AND STREAM* last summer, we were absent in the West, and hence our attention was not specially called to the matter, as it would have been had we been in charge of the office at the time. This absence must plead our excuse. The error was observed almost as soon as the paper came from the press, but of course too late for correction.

The services of Judge Everts and Mr. Hapgood, whose letters we print below, are too well known in this connection to need comment or praise from us, and we cannot help believing that although their efforts just now seem to have me with a check they will ultimately be crowned with success.

RUTLAND, NOV. 26, 1877.

#### EDITOR FOREST AND STREAM:

Judge of the surprise of the Rutland Fur Co. on reading an article in your paper of last week, headed "Quail at Sea." Have we a new variety of quail? With your correspondence and editorial you seem to be in a profound doubt, but to throw light upon the subject, I would suggest that it is not necessary to look to Jamaica or St. Croix for a solution of the question you propound, but let the *FOREST AND STREAM* refer to itself. See your paper of June 25, page 341; August 2, page 447; August 9, pages 10, 11 and 12; August 23, page 51; September 6, page 83, and November 15, page 296, all of which have reference to the importation of migratory quail to this country the past season; also letters in *ROD AND GUN* of January, 1876, written to Dr. Goldsmith, then in Europe, by me, which is believed to be the first record ever in print in favor of their importation.

On the 8th of June last I received, through the kindness of Mr. Geo. H. Owen, United States Consul at Messina, Sicily, from Mr. D. Bonanno, out of an invoice of 200, 197 of the migratory quail in the best condition. One half of them were turned out the next day, 9th, and the remainder on the 11th (the 10th being Sunday) in most favorable places for breeding (see your paper of Aug. 2). I should judge that the sexes were divided as follows: 80 males to 120 females. They commenced laying within five days of the time they were turned out. A large number of nests were found, the number of eggs in each nest ranging from eleven to sixteen—as a rule thirteen or fourteen. Barring accidents, which happened to two or three nests, almost every egg hatched, and the young birds left in an hour after hatching. One old bird was run down by a moving machine while hatching. She took her young out of the nest, leaving one egg with a live bird in it unhatched. Five or six nests were built within fifty yards of farm-houses, or within thirty rods of the place where they were turned out. There are more than twenty different fields where the young birds have been seen ranging in numbers from twelve to fifty in a field. The eggs of the birds are of the size and shape of the American quail's egg, though of various shades of color, from the color of the turkey's egg to that of a Dausseus gun barrel. The male bird is very cheerful and happy night and morning about dwellings and fence-yards, while the female is hatching and caring for the young.

The birds fed, almost exclusively upon grasshoppers and other insects; were seen in large parties, mainly young, enjoying a grand grasshopper hunt, but at the slightest motion of an intruder all would skulk and could not be found. Had these birds been placed in the Missoni Valley fifty years ago it is believed that the grasshopper plague would never have occurred. The young birds at four weeks old would fly with nearly the same facility as the old ones. Many of the birds migrated before September 1. A few were left, a sort of rear guard, ten days later. It is believed a safe estimate that eighty females bred and migrated. Not to exceed ten birds, old and growing, are known to have been killed—all by accident.

It is a bad omen for their successful acclimatization that they leave the coast so far north. "That they go down to the sea in ships that do business in great waters." Those birds will most certainly perish. Would it not be better to introduce the birds far West, away from sea-coast, so that their migration would extend into Mexico? Should any number of these birds follow the coast to lower Florida they might easily fly to Cuba, Jamaica, San Domingo, or Yucatan, in which case they would most certainly return. It seems impossible that all should perish off North Carolina. They seemed not at all inclined to suicide while here. Your correspondent "Virginian" has given an accurate description of our birds. The mark of dark feathers across the throat of the male is very prominent, and the sexes easily distinguished. Will not other sportsmen in the South communicate with you should they fall in with the birds during the winter? Before closing, I must, do a simple act of justice to Mr. W. Hapgood, of Boston (see his letter of August 9), as he, among all the men corresponded with previous to the importation of the birds, endured to the end, and received his birds on the same ship with ours, while so many who promised their co-operation failed to fight but fainted. Truly yours,

W. G. EVERTS.

BOSTON, NOV. 23, 1877.

#### EDITOR FOREST AND STREAM:

Returning on Saturday last from an excursion of several days' quail shooting at Cape Cod our attention was called to some editorial comments upon two letters in your last issue, Nov. 22, describing a new species of quail. The editorial remarks are on page 366 and are headed, "Quail at Sea—Have We a New Variety of Quail?" By referring to *FOREST AND STREAM* of Aug. 2, or to the 9th of the same month, or to various notices of the "press" up and down the land, any one may inform himself as to the introduction of the "new variety of quail" into this country as well as of their habits and characteristics. In the article of Aug. 9 the writer asks this question, in reference to the newly imported European quail (*Coturnix Communis*): "If they migrate will they strike boldly out to sea, thinking they are to cross the Mediterranean and thus perish?" The information conveyed by your correspondent "J. G. W." would seem to confirm the worst fears of the writer. That "J. G. W." being one of the "new readers" of your interesting journal, should not be familiar with the fact of the importation of these birds, or that the matter in hand should have escaped the notice of "Virginian" who describes the markings and habits of the birds remarkably well, particularly that part which refers to "puzzling the dogs," would seem to elicit no comment, but that the editor of *FOREST AND STREAM*, who has previously acknowledged in complimentary terms the effort to introduce European quail into this country, and who usually seems to know and remember everything pertaining to sporting matters, should fail to recognize these birds, is truly surprising. The parties who imported these birds, have, from the very day they were planted upon our soil, had great solicitude about their propagating, migrating and returning. So earnest were some of them, that they desired notice to be given through your columns of the probable appearance of these birds at the South, and requesting information through the same, as to their habits and modes of life in winter; but not wishing to trouble the editor, and thinking some one would be likely to observe and note the new comers, the request was not made. There is no positive evidence to show that the birds planted in Massachusetts bred extensively; the several broods are known to have existed, while those planted in Vermont multiplied prodigiously. The reason for this has not yet transpired. Do they breed better in mountainous regions, than in level sections along the sea board? Or do they find congenial food in the Green Mountain Range which utterly fails on the Atlantic coast? Both colonies migrated about the 10th or 15th of September.

Now, if they are foolish enough to leave these happy shores with all the millions of acres of wheat fields behind them and put to sea steering in a Southeastwardly direction, as represented, we may as well close "Adventure No. 1" in quail, not by "profit and loss," but "lost at sea;" for not one of them will ever again see land. Should they change their course and steer more to the Southward, as they would be likely to, they would still be unable to reach the Bahamas, the nearest land some six hundred miles distant. We cannot help thinking that if these prolific little breeders could be introduced into this country and by some system of planting be taught to migrate only from the Northern to the Southern part thereof, and vice versa, it would be the greatest boon to future generations of sportsmen we could offer. If the account given by "Virginian" is true, as we believe it is, that when flushed near the coast they rise to an altitude of "five or six hundred feet" and then

"strike straight out to sea," it shows that they are just upon the eve of their long migrations, as the older ones—who are probably the leaders here—are wont to do, from the southern shores of Europe crossing the Mediterranean Sea to spend the winter months in Africa. The fact that the friend of "J. G. W." saw them a hundred miles at sea off Hatteras rather confirms the statement of "Virginian," and both together fill with saddest disappointment the hearts of those who have struggled to introduce them here. There are parties here now ready and willing to import a thousand or more of these birds to stock the country if any degree of success is probable, but if they all "strike out to sea" the next autumn and perish, as they must, in the waves, some new plan of operation must be commenced or the whole scheme abandoned. We would suggest, if the birds were planted in Florida or the Carolinas, in March or April, they would hardly think of going South at that period, but would be likely to go North in May, where they would breed and possibly return to the place of colonization the following autumn; or again, the callow birds might be captured in nets or otherwise at the end of August and kept at the North during the winter to be released in the spring where, they would reproduce their young, which possibly might not incline to leave our shores and perish, as have their predecessors. The whole matter is now open before our sportsmen who are more intimately interested, though every person should feel an interest in the subject, as it would, if successful, add somewhat to the food supply for the whole country. We are still not without hope that some plan will be suggested whereby the birds may be successfully introduced and bred here. We also desire from the South further information of our little pets, still "hoping against hope" that some of them may tarry and dwell with our Southern brethren during the winter, to return and receive from us in the spring a hearty welcome.

W. HAPGOOD.

#### EDITOR FOREST AND STREAM:

In your issue of Nov. 22 there is an article headed, "Have We a New Variety of Quail?" with two letters on the subject. Now, are not the quail found off Hatteras and in North Carolina the European migratory quail, some hundreds of which were put out by Judge Everts, of Vermont, last spring, and nearly as many by different sportsmen around Boston, with the hope that they would breed, go South on the approach of cold weather, return in the spring North to increase and multiply, giving us a quail that would not be so likely to be water-killed as our native bird? It is hoped that specimens may be properly identified. There was some fear expressed that they might try to cross the Atlantic, and, of course, perish; but if they have followed the coast as far as North Carolina, let us hope that most of them may be preferred, and that the introducing a new game bird becomes a success. A large importation will probably be made this winter, if it seems at all probable that the attempt last spring was a success. Your correspondent, "Teal," shot one, November 1, at Essex, in this State, which was a young cock bird, showing that those put out about here had bred. With the hope that notice of any strange quail being found or shot may be forwarded to you for insertion, I remain, very respectfully,

STANCH.

[We earnestly hope that any and all of our Southern friends who may chance to meet with these little immigrants will at once communicate with us. Notices of their habits, so far as it is possible to observe them, are especially to be desired, as we cannot hope to be successful in our efforts to introduce them to this country unless the requirements of the birds become more fully known than they are at present.]

Judge Everts' suggestion of planting a colony of them in the West, perhaps in the Mississippi or Missouri Valley, seems to us a most happy one, for, if located there, is does not seem possible that they could reach the sea.—*Ed.*

### A PROVISIONAL LIST of the Birds Procured and Noticed by Mr. Fred. A. Ober in the Island of Dominica.

BY GEO. N. LAWRENCE.

ABOUT a year ago an agreement was made by the officers of the Smithsonian Institution with Mr. F. A. Ober (the well-known correspondent of *FOREST AND STREAM*), to make explorations in some of the Lesser Antilles, thereby to obtain a better knowledge of their natural history than we have heretofore possessed. It was arranged that I should examine the birds, and prepare a catalogue of the species found in each island, to be published when its investigation was completed.

Mr. Ober commenced with Dominica, and has sent three collections from there, comprising, apparently, with a few exceptions, all the land birds he heard of that inhabited the island. Some of the sea birds, not easily obtainable, were observed sufficiently to be surely known. I am now preparing the catalogue of the birds of that island, to be accompanied with the notes and observations of Mr. Ober; but as its publication possibly may be delayed, it has been thought advisable to put on record in *FOREST AND STREAM* the result of Mr. Ober's explorations:

1. *Margarops herminieri* (Laf.)
2. *Do densirostris* (Vieill.)
3. *Do montana* (Vieill.)
4. *Cinlocoerthis ruficauda*, Gould
5. "Thrush?" Heard of but not obtained.
6. *Myiadeses genibarbis*, Sw.
7. *Thryothorus rufescens*, Lawr.
8. *Sitta naxos* (Bodd.)
9. *Erebia virens* (Gm.)
10. *Dendroica peregrina* (Linn.)
11. *Do plumbea*, Lawr.
12. *Setophaga ruticilla* (Linn.)
13. *Vireosylva calidula* var. *dominicensis*, Lawr.
14. *Progne dominicensis* (Gm.)
15. *Certhiola dominicensis*, Taylor.
16. *Euphonia flaviventris* (Spar.)
17. *Salicitoria guadeloupensis*, Lafr.
18. *Corollia noctua* (Linn.)
19. *Phoniparus bicolor* (Linn.)
20. *Iama martinica* (Linn.)
21. *Myiarchus oberi*, Lawr.
22. *Eucispa alba*, Gand.
23. *Tyrannus rostratus*, Sci.
24. *Eulampis jugularis* (Linn.)
25. *Do. holosericeus* (Linn.)
26. *Thalassidroma wagleri* (Less.)
27. *Orthorhynchus exilis* (Gm.)
28. *Chaturus polina* (Temm.)
29. "Swift." Larger than the preceding species, not obtained.
30. *Ceryle acron* (Linn.)
31. *Ooccyzus minor* (Gm.)
32. *Chrysolis augusta* (Vig.)
33. "Parrot." This species is well known, but Mr. Ober was unable to procure it.
34. *Strix dauma* var. *negrescens*, Lawr.
35. *Falcon habatus* (Linn.)
36. *Buteo pennsylvanicus* (Vill.)
37. *Immunocis sarverius* var. *antillarum* (Gm.)
38. *Fregata aquila* (Linn.)
39. *Puffinus pacificus* Brandt.
40. *Pelecanus fuscus* (Linn.)
41. *Ardea candidissima* (Gm.)
42. *Do. herodias*, Linn.
43. *Butorides virescens* (Linn.)
44. *Colymbus coromys*, Gm.
45. *Zonotrichia querula*, Bp.
46. *Chamaepelia passerina* (Linn.)
47. *Gerygon montana* (Linn.)
48. *Charadrius virginicus*, Borkh.
49. *Scolopax interpres* (Linn.)
50. "Sandpiper." Specimen not yet to hand.
51. *Tringoides macularius* (Linn.)
52. "Tern." Seen by Mr. Ober, and thought to be *Arenis stolidus*.
53. *Sterna antillarum* (Less.)
54. *Do. fuliginosa* (Jm.)
55. *Diomedea immutabilis*, Scop.
56. "Diaboline." A species of Petrel, which burrows on the top of high mountains for a nest. A nest was abundant, now rare. Mr. Ober has made arrangements by which he hopes to obtain this and the other species he failed to get.

## A FEW WORDS CONCERNING RUFFED GROUSE.

### EDITOR FOREST AND STREAM:

"He who shooteth the ruffed grouse on the wing is greater than he who taketh a city!" So says a friend of mine; and so, doubtless, he is greater than he who taketh a city by bringing to bear on it a photographic camera; for this anyone of ordinary capacity, can be taught to do, while the crack shot (and he only, can, with any certainty, bring the swift-winged grouse to earth) is, as we are told by J. Cypress, Jr., "the work of God."

For myself, I am free to acknowledge that when I have, more by good fortune than skill, accomplished this feat handsomely, I feel puffed up with self-satisfaction, on to about the size of an elephant. I would that I might often feel this comfortable inflation, but alas, perhaps the next half-dozen glorious opportunities are missed, and then I shrink to more than normal attention.

He is a hard fellow to bring down, and is admitted to be, by all, and by most sportsmen, the most difficult of all our birds, though Frank Forester says that "he hangs heavily at first on the air" (see "Manual," page 346), and is far from requiring an unusually hard blow to bring him."

First and last I suppose I have flushed a thousand or more of these birds, as what wood-ranging New Englander has not, and never one among them all that started in good earnest but went off like a rocket. Sometimes, though very rarely, they seem scarcely alarmed, and fly hesitatingly, as if looking for a good place to alight, which they soon do in such cases, if not taking more flight. Such a ruffed grouse as figures in the frontispiece of vol. 1 of "Field Sports" might, indeed, hang heavily, for the poor fellow has no wings.

As for their being easily killed, my experience has led me to a contrary opinion. Some fresh instances of their tenacity of life have come to my knowledge this season. Early in October I took a snap shot at one flying across me and saw him fall. Going to pick him up I found him fluttering along in just the opposite direction from that in which he was flying when shot, and so rapidly that he led me a chase of twenty rods or more before I caught him, and apparently had still a good deal of life in him. Yet there were three No. 8 shot through his neck and four in his body. Another shot at not many days since, while flying from me behind a low tree, and at first supposed to have been missed, was found hiding by an old hound that was with us (for we were fox hunting), and though he had five or six No. 6 shot in his body and a broken wing to boot, had lots of running power left in him. Several like cases have occurred in the shooting of my companion and myself this fall and I have no doubt that in shooting without a dog very many shots that eventually kill are considered misses, to the shooter's great self-dignity.

I remember shooting at one last year, that was running among some hazel bushes, and with intense chagrin saw him go whirling away through the branches as if he had been fired from a mortar, and apparently unhurt. I could not believe that I had quite missed him, and the feathers found where he was when shot at proved that I had not; so, taking heart, I followed up his line of flight for twenty rods or more, and then gave it up. Retracing my steps half the distance, St. Hubert, or some kindly spirit of the woods, led me to diverge a few steps at right angles with my course, and lo! there lay my bird on his back stone dead.

I never have seen a "king partridge," nor had ever heard or read of one till Penobscot's entertaining article appeared in your columns. It would be interesting to know whether these singular birds were found only in primeval forests, or sometimes in the woodlands of old-settled countries. It is well known that birds and beasts change their habits as their haunts become circumscribed or altered by the encroachments of civilization; and this may be a case in point.

I used so repeatedly, year after year in the fall, to see ruffed grouse in such unaccustomed places out of the woods, that I came to think this periodical desertion of its usual haunts a habit of the bird, and in a series of articles on "Game Birds" for the *Rural New Yorker*, a few years ago, if I may be allowed to quote myself, wrote of it as follows: "There is a habit of this bird, so common here that I cannot think it peculiar to this region, and yet it is so noticeable, that if it is not so, I wonder I have never seen mention made of it. Here, in autumn, about the time of the falling of the leaf, many individuals of this species are often seen a long distance from the woods they inhabit, and close about dwellings. I have frequently flushed them within a few rods of our house, and once started one from a wagon box under the shed, and saw another in a barn, and one of our hired men actually caught one in the hog-pen. Another was seen on the stoop, and one morning, as we were eating breakfast, another came close under the window near which the table stood; all these, at least, were a mile from any woods which these birds haunt. The theory of an old hunter, that they were frightened from the woods by the falling of the leaves, seems as reasonable an explanation of this curious fact, as any that I have ever heard advanced."

But, late years, the perverse birds have not borne out my statement concerning them in this respect, for I have not seen one under such circumstances for half a dozen years. It is greatly to be wished that such of the thousands of intelligent readers of *FOREST AND STREAM*, as have had an opportunity of observing this bird, would communicate the facts noted respecting this freak, and the "king partridge" matter.

It seems late in the day to have to contradict the old-time and entirely false notion, that the ruffed grouse produces the sound known as "drumming," by beating a hollow log with his wings! How long would the wing-feathers endure such vigorous thumping, repeated, in the wrooding season, perhaps fifty or a hundred times a day for many days? And if the amount of noise produced depended on the resonance of the standing-place of the bird, his performance must needs be an unsatisfactory one to him, when standing on a rock. True, he seldom chooses such a place, but Penobscot is a witness that he sometimes does, as am I, and doubtless many others. Logs are certainly his favorite and usual drumming places, though I should say, not often hollow logs though those which are not so. The attachment of the grouse to a particular log explains why prostrate pines are oftentimes chosen, they withstanding decay the longest. The writer just mentioned gives an excellent explanation of the fall drumming, which every one who has been much in the haunts of the grouse during that season must have heard in warm, still days in October and November.

That companies of grouse will sometimes allow themselves to be shot from a tree, one after another, if they are shot in succession from the lowest upward, is pretty well established by the testimony of a multitude of witnesses, though a high authority in sporting matters pronounces the statement "fabulous and ridiculous." Only a few days ago a friend of mine, whose word I do not doubt, told me of shooting three from a tree on an Adirondack river, down which he and his companion were boating.

Whether it is fair and sportsman-like to shoot these birds sitting, when the opportunity offers, seems to be an unsettled point, though I apprehend that very few sportsmen let go such chances. For my part, I must confess that I cannot see wherein it is more sportsman-like to shoot him sitting than to pour a murderous volley into an unsuspecting flock of ducks as they sit in a huddle on the water. Certainly it requires no less skill to do the first than the last. AWANOSKE, *Essexbury, V.*

**FLIES.**—Recently Dr. Loidy imparted some interesting facts in regard to flies. On a visit to Easton during the season of harvesting the wheat, Dr. Loidy writes:

I noticed that the wheat in the vicinity had been attacked by the Hessian Fly. The insect was then in the semi-pupa or so-called "flax-seed state," and occupied the stalks within the leaf-sheaths, a few inches above the ground. In this position, when several insects are together, they so weaken the stem that it frequently breaks down. From this cause, in one large field many stalks with nearly ripe heads were observed to be prostrate; probably to an extent of one-third of the crop. As the insects at harvest time occupy the lower part of the stalks, they are left in the stubble and may be destroyed by burning this. In regard to the house-fly, it is reported to deposit its eggs in the refuse of stables, in which the insect passes the earlier stages of its life. In the mature or winged condition it seeks our houses. In this state flies are probably not long lived, but appear and visit us in successive swarms. It is not the house-fly which bites, but one of another genus, though closely resembling the former. House-flies are not merely annoying creatures and useful as scavengers; they are filthy feeders, and probably often the agents of communicating diseases. During the late civil war I observed healthy soldiers, with trifling wounds, die of hospital gangrene, which I believe was communicated through the agency of the house-fly. On one occasion, visiting a friend, I observed some toad-stools of a peculiar kind growing on effuse shavings thrown from an ice-house. The toad-stools were covered with a glairy liquid, emitting a strong odor, and containing the spores or reproductive germs of the fungus. Noticing a great many house-flies sipping the liquid I caught some. While holding the flies they would exude from the proboscis minute drops of the liquid; and this, on examination with the microscope, was found to be full of the fungus spores. This instance well exemplifies the manner in which the house-fly may carry materials from one place to another. Thus matters may be conveyed to our food which ordinarily do no harm, but which may prove to be poison if communicated to a wound or introduced into the blood. As the house-fly passes its earlier stages of life in the midst of stable refuse, we would perhaps be troubled with it less if the refuse was kept in a dry state or covered with earth. During the prevalence of cholera I remember hearing persons say that the flies died of it, but I found that the affection of the fly was a common fungus (not foreign) disease."

**A REMARKABLE COMBINATION.**—In a paper recently read before the Philadelphia Academy of Natural Sciences, Prof. Gill and Dr. Bransford give the results of their investigations of the fish fauna of Lake Nicaragua. These results are most curious and interesting, for, although this lake is perfectly fresh, and abounds in characteristic fresh-water types, these *savans* find associated with them marine forms equally characteristic. Among these marine forms are a species of tarpon (*Megalops*), a shark and a saw-fish. As remarked by *Nature*, a similar combination occurs in the Philippines, where in a fresh-water lake a sawfish and a dogfish are found. The *Megalops*, however, is not known elsewhere in water so isolated from the sea. Of course the probable explanation of the occurrence of such forms is, that these salt water fishes were detained in arms of the sea, which by some convulsion of nature were cut off from the ocean and gradually became fresh-water lakes. We notice that recently Prof. Marsh, of Yale, has described a ray, which is a truly marine fish, from the freshwater deposits of the Rocky Mountain Eocene. A case clearly in point.

**HONORS TO DARWIN.**—The University of England has conferred upon Darwin the degree of Doctor of Civil Laws. The event is memorable, both as a well merited, though tardy recognition of the great scientist's work, and also as a victory for the anti-clerical party of the university. Notwithstanding Mr. Darwin's illustrious rank in the scientific world, the clerical power in the governing bodies of both Cambridge and Oxford has hitherto barred the due acknowledgment of his work. The *New York Herald* says:

Mr. Darwin's friends presented themselves in great force, determined that the moral effect of a large representation of scientific and literary men present in the interest of the heretofore-neglected scientist should not be wanting. Undergraduates thronged the galleries of the great hall, and the desire to see the savant of Down was universal.

The undergraduates indulged in the usual license of such occasions, and at a critical moment in the proceedings an effigy of a monkey robed in an undergraduate's gown was lowered into the middle of the hall from the most prominent point in the gallery. This effigy bore a legend in large letters, "The Missing Link." Notwithstanding all this chaffing and laughing, there was much sincere enthusiasm.

**CORRECTIONS.**—In the list of plants valuable for fish ponds, published in our last issue, were several errors, which will be found corrected in the following list:

*Zemichellia palustris*, *Phragmites communis*, *Glyceria Canadensis*, *G. elongata*, *G. acutifolia*, *G. fluitans*, and *G. aquatica*; *Spartina cynosuroides*, and *S. striata*, var. *glabra*; *Calamagrostis Canadensis*; *Zizania aquatica*, *Carex comosa*, *C. crinita*, and *pseudo-cyperus*; *Scirpus polyphyllus*, and *S. eriophorum*; *Nesaea verticillata*, *Polygonum amphibium*, and *P. pennsylvanicum*. The Horned Pond should have been called a Naiad, not a Naiadly.

—Mr. Ernest Ingersoll tells us that he would like to exchange pamphlets upon zoological topics, of which he has a large quantity of duplicates, for land and fresh water shells (snails, etc.), from any part of the country. His address is No. 251 York st., Jersey City, New Jersey.

—The endorsements of chemists and physicians can sometimes be bought. But simple truth finally prevails. Therefore B. T. Habbit's Toilet Soap fears no rival. People are finding out that this new toilet soap is absolutely the perfect superlative in saponaceous comparison. It doesn't take long to be convinced of this fact, as manufacturers of scented soaps are discovering. Its purity and excellence will be sure to win the day.—[Adv.]

## Woodland, Farm and Garden.

THIS DEPARTMENT IS EDITED BY W. J. DAVIDSON, ESQ. N. Y. HORTICULTURAL SOCIETY.

### DECEMBER.

And after him came next the chill December;  
Yet he, through merry feasting which he made,  
And great bon-fires, did not the cold remember;  
His Savior's birth his mind so much did glad.  
Upon a shaggy-bearded goat he rode,  
The same whereon Don Ivo in tender years,  
They say, was nourished by th' Ilean Mayd;  
And in his hand a broad, deep bowl he beared,  
Of which he freely drinks an health to all his peers.

—SPENLOW.

### THE EARLY ROMAN HYACINTH.

THIS charming early flowering variety, so dwarf and free, and bearing such chaste, delicately-scented white flowers, is now largely imported from France, Holland and Belgium for forcing purposes. Owing to the increasing yearly demand for it, it has been quite scarce this season, and an enhanced price has been the result. This will scarcely affect its growth, however, for market, Mr. Murkland, of Messrs. Young & Elliott, 12 Cortlandt street, informing us that their sales this season have been larger than ever, they not being able to supply the demand with a stock of over 100,000 bulbs. It is much admired by the ladies for its chasteness and fragrance, and is so useful to the florist, being devoid of all stiffness. It can be used with effect in any design that any one taking notice of their various stores cannot fail from the first of November until May to see them displayed in large quantities in their windows. It can be forced with great rapidity, and the bulbs, though not nearly so large as those of our ordinary hyacinths, each produce several spikes of flowers. There is a blue form of this, sometimes called Parisian Hyacinth, that is a little later in blooming, but is also very useful. Even when there is no artificial heat, a few of these early flowering hyacinths can be had in bloom some time before the ordinary hyacinths, even when planted at the same time. A rather pretty way to grow them is to take a six-inch pot or even a soup plate, and placing one ordinary hyacinth bulb in the centre, surround it with five to eight Roman Hyacinths, using moss instead of soil, and placing it in the dark till well started into growth. These latter will come into bloom before the centre bulb makes much growth, when they can be cut out, and a few ferns or selaginellas put in their place. The centre hyacinth will have space enough to grow, and will flower as finely as if there had not been an extra crop grown in the same pot. As a matter of course, the soil ought to be good, and it is well to apply a little weak manure water, or sulphate of ammonia in water to the late variety. It matters not what care may be taken of the bulbs of the early Roman Hyacinth, or how scrupulously they may be preserved, they scarcely ever flower the second year, as imported bulbs do.

### BRUNSVIGIA.

MR. PETER HANSON, of South Brooklyn, has again placed us under obligations to him for a most remarkable cross between *Brunsvigia Josephiniana* and *Amaryllis Belladonna*. This specimen (the first of four seedlings, all distinct in character, that has flowered) bears the habit of both parents very distinctly, and although not so pretty as either of the parents, it is quite a botanical curiosity; as it is often said that *Brunsvigias* will not, or very rarely, cross with any other *Amaryllids*. The color of this seedling is a fine dark pink, something like a well-grown *A. Belladonna* major—perhaps darker yet; the shape of the flowers resembles more that of *Brunsvigia*. The bulb, now some seven or eight years old, flowered for the first time this season, while the seedlings of *A. Belladonna* crossed at the same time, flowered over two years ago. The flower scape, some eighteen inches high, bore an umbel-like flower with eight flowers, and, although they do not open very wide, the wavy appearance of their petals and their distinct character will be of great interest to all lovers of bulbous plants, and will even attract the attention of botanical students. The effect of this variety will undoubtedly increase with age, as with the increasing size of the bulb the number of flowers will be larger, and most likely will come to greater perfection.

The Rev. William Herbert, our great author on *Bulbous Plant* says: "All *Brunsvigias* have a cartilaginous margin and broad, recumbent leaves, but if it is, as I believe it to be, distinct from *Amaryllis*, the distinguishing features are, the triangular capsule, which is almost winged and diaphanous, and the petaline filaments not adhering to the petals." *B. Josephiniana* has bred with *Amaryllis Blanda* (*belladonna*), but disagreed with *B. Multiflora* in the insertion of its filaments, and in that point as well as its tube and germen I saw that it nearly agreed with *blanda*, but I was deterred by the curvature of its corolla from removing it from the genus where it had been placed. \* \* \* I therefore wish all who have flowering *Brunsvigias* to try if they can obtain a cross between them and *A. Belladonna*." That Mr. Hanson has been successful in both crosses cannot be gainsaid; the cross with *A. Belladonna* for the parent is undoubtedly the most striking and beautiful, bearing last season sixteen beautiful pink flowers on one spike, while the cross with *Brunsvigia* for the parent is the greater botanical curiosity.

ENGLISH NAMES OF WILD FLOWERS  
AND PLANTS.\*

(Concluded.)

ALL first attempts at classification, etymological or other, leave a margin of miscellaneous items refusing to be ticketed or systematized; and there remain a few names falling under none of the categories which I have cited, yet too interesting to be omitted. Such is Apple, retaining its form in the Teutonic, Celtic, Slavonic, and Lettish languages, and springing apparently from the Sanskrit *ap*, water, which reappears inverted in the Latin *pa* of *Padius*, *po* of *Poto* and *Pomum*, meaning therefore the water fruit or juice fruit. Such again is Daffodil, the Daffadowndilly of Spenser and other poets. It is a combination of *sapharoun*, or Saffron Lily, with *asphodelus*, the old English Affodilly. With the taste for alliteration often shown in popular names the Sapharoun Lily blending with the Affodilly become by a mutual compromise Daffadowndilly, whence Daffodilly and Daffodil. Forsydia is the Fox's-glew, or tintinnabulum, a ring of bells hung on an arched support. Bedstraw was a plant much used for couches before mattresses were invented, and a species which when dry yields a pleasant scent is still called Lady's Bedstraw. Carnation is coronation, its flowers being used as crowns or chaplets, just as Campion is champion, gathered to crown the champions in a tournament. Cress is possibly from cross, its petals being cruciate; possibly from *creresco*, to grow, in token of its rapid increase. It was used in Chaucer's time, under the form of *kers*, to express any insignificant quantity.

"Of paramours no raught he not a kers,"

from which comes, perhaps, the vulgar phrase, "I do not care a curse," though a yet ruder parallelism has since been manufactured to confuse its spelling and its etymology. Nettle is from *ne*, to spin, indicating that its coarse fibres were used for thread in early times—an idea borne out by Hans Andersen's beautiful tale of the wild swans, in which you remember that the princess was permitted to redeem her brothers from their transformation by weaving them shirts of Nettles. Shamrock is from an Erse word signifying the little Trefoil. The story of its theological use by St. Patrick is of modern date, and it has been taken by various writers to represent the Watercress, the Wood Sorrel, the Dutch Clover, and the Black Medick. Irishmen are divided in the present day between the two last, which are sold on St. Patrick's Day both in London and Dublin. The Snowdrop is so-called from its resemblance to the large eardrops worn by ladies in the sixteenth century, and represented often by painters of that period. The Tobacco was the Indian name for the pipe in which the weed was smoked, not of the weed itself; and Potato belonged at first to a tropical Convolvulus, and was transferred by mistake to the well-known esculent. The Gooseberry was the cross-berry, from its triple spine which frequently takes the form of a cross. The Hollyhock is the cauli-hock; hock being an old name for the Mallow, to whose order it belongs, and cauli, meaning Cabbage, either from its lofty Cabbage like stalks, or, as in Cabbage Rose, with reference to its rich double bloom. The Laburnum closes its petals at nightfall like a tired laborer, and the Ozier is named from the oozy beds, which suit its growth.

I bring my list to an end, not because it is exhausted, but for fear my hearers should become so. I have picked only the most suggestive and curious of our many floral names, leaving an abundant gathering to many gleaners. One branch of the subject I have barely touched, the superstitious practices attaching to many of our wild plants, though not surviving in their names. I have left alone the interesting question of Bible plants, of the Hyssop, the Juniper, the Mustard-seed, the Lilies of the field, the burning bush, the Shittah, the Almond, the Gopher, the curiously mistranslated cab of dove's dung, with the light thrown on their identity by the names given to them in the commentaries in our older translations. Nor can I do more than hint at the rich store of literary allusion to our wild flowers which abounds in all English poets, and the beautiful thoughts suggested to many of them by some particular plant. I should have liked to read you Chaucer's lines upon the Daisy, Herrick's on the Daffodil, Burns' on the Dog Rose, Shelley's on the Sensitive-plant, Southey's on the Holly, Wordsworth's on the lesser Celandine, Longfellow's on Compass-plant. I should like to open volume after volume of Elizabethan and of later days—to enumerate and discuss the flowers with which Ben Jonson bid us "Strew, strew the smiling ground;" the "pretty pavid and cleveance," of Spenser; the "quaint enamelled eyes" that decked the laureate bourse of Lycidas; "the silver globes of Guelder Rose" which won the heart of Cowper; the "Hawthorn bush beneath the shade" of Goldsmith's lovers; the "slight Hairbell" which raised its head, uncrushed by the airy tread of Ellen Douglas. I should like to remind you of the lessons in natural theology which Paley drew from the "little spiral body" of the Dandelion seed; of the star-shaped shadow of the Daisy which Archer Butler showed to Wordsworth; or how Linnaeus, when he first saw the wild Broom in flower—

"Kneel before it on the sod,  
For its beauty thanking God."

Above all I should love to turn with you the page of Shakespeare, to read of the gray discolored head of Lear wreathed with "rank funerals and furrow weeds;" of Perdita at the shearing feast, disparaging the streaked Gillyflowers as Nature's bastards; of poor distraught Ophelia distributing her Rosemary and Herb-of-grace; of Puck telling how Love-in-idleness was purpled with love's wound; of Titania gently entwining the "female Ivy and sweet Honeysuckle" round the sleek smooth ass's head of Bottom; of Helena and Hermia, "a double Cherry seeming parted, two lovely berries moulded on one stem." For I should lay on you a spell mightier than I can forge myself—I should invoke allies before whom we all bow as the source of our intellectual happiness and growth; I should remind you how the most creative minds have drawn nutriment from these tenants of our hedgerows and hill-sides, and how the knowledge of their lore helps us in its turn to interpret the sweet thoughts and apt illustrations of the poets they inspired and delighted; how, if the aspirations of my Cambridge botanist were fulfilled—if the Daisy could become the *bellis*, the Strawberry the *fragaria*, the parting genius of *caprifolium*, the Heather the *calluna*, the Honeysuckle the romance and myth and association and folk-lore would be sent sighing from the domain of botany, and the richest and

most attractive of the natural sciences would become the dull and the most neutral.

In conclusion, let me disclaim all merit of originality in the ideas which have been put before you to-night. I have but attempted to bring together, with the interest attaching to cumulative illustration, conjectures which have been started and discoveries which have been worked out by others. Scattered through the old-fashioned tomes of Cole, Lyte, Parkinson—through the pleasant pages of Loudon, Pratt, Johns; above all, in the most valuable work on popular botany which we owe to our Somersetshire naturalist, Dr. Prior, you will find all or nearly all that I have advanced. The flowers were plucked by other hands; mine has been only the *pia dextera* to sort and wreath them.—*Nature*.

For Forest and Stream and Rod and Gun.

## THE MOST PROFITABLE SHEEP.

DIFFERENCE BETWEEN SHEEP-MEAT AND MUTTON.

*Friend Hallock*—If you will kindly make room in your agricultural department for a few additional remarks on sheep, I will promise to have done with the subject. Which class of sheep is the most profitable to the farmer? is a query much more easily made than answered. Indeed, the solution of the problem depends on so many and such varied conditions, such as climate, soil, locality and value of land, as to preclude a definite answer.

Under certain contingencies, the profits of sheep breeding are derived solely from the increase of the flock and the annual yield of wool; but this, by far the most extensive branch of sheep husbandry, is necessarily confined to such pastoral countries as Texas, Colorado, California and New Mexico, where, as yet, the shepherd can command free of all cost, and all the year round, a perennial and unlimited range for his flocks. Of course, in the older States, with a ruder climate and a circumscribed range within inclosed high-priced lands, it would be folly to dream of competing in the production of wool with the boundless grass-covered plains of the Southwest, which are free to all without limit and without price. Hence we are compelled in our sheep-breeding to look for our profits to the meat market rather than to the woolen mills, and it is upon this particular branch of this great agricultural industry that I propose to address you a few remarks.

Henry S. Randall, in his admirable letters on sheep husbandry, tells us that in selecting a breed for any particular locality, we must take into consideration, first, the feed and climate, or the surrounding natural circumstances; and, second, the market facilities and demands. We should then make choice of that breed which, with the advantages possessed, and under all the circumstances, will yield the greatest net value of marketable product.

Rich lowland herbage, in a climate which allows it to remain green during a large portion of the year, is favorable to the production of large carcasses. If convenient to markets where mutton finds a prompt sale and good prices, then all the conditions are realized which call for a mutton, as contradistinguished from a wool-producing sheep. Under such circumstances, the choice should undoubtedly rest between the improved English varieties—the Southdown, the New Leicester, and the improved Cotswold or New Oxfordshire sheep. In deciding between these, minor and more specific circumstances are to be taken into account.

If we wish to keep large numbers, the Down will herd—that is, remain thriving and healthy when kept together in large numbers—much better than the two larger breeds. If our feed, though generally plentiful, is liable to be short during the droughts of summer, and we have not a certain supply of the most nutritious winter feed, the Down will better endure occasional short keep. If the market calls for a choice and high-flavored mutton, the Down possesses a decided superiority. If, on the other hand, we wish to keep but few in the same inclosure, the large breeds will be as healthy as the Downs. If the pastures be wet and marshy, the former will better subsist on the rank herbage which usually grows in such situations. If they do not afford so fine a quality of mutton, they, particularly the Leicester, possess an earlier maturity, and both give more meat for the amount of food consumed, and yield more tallow. Doubtless, my dear Hallock, you, as a discriminating and traveled gourmet who have enjoyed the tid-bits from the most succulent flesh-pots of both hemispheres; who, like our friend Charles Hutchinson, are an ardent disciple of the great Savarin, and whose dictum like that of the illustrious Mr. Sam Ward can make or mar the fortunes of aspiring cooks, have more than once deplored the general absence of good, ripe mutton from our American tables. Does not the water come into your mouth as you remember, with fond regret and perchance covetous longing, the magnificent mutton of old England; the juicy haunch from a four-year old black face, fattened on those Grampian Hills where erst the young Norval tended his father's flocks, or the delicious saddle, marbled with lean and fat of a ripe wedder, South-Down grazed upon the breezy down of Hampshire? Such mutton as our friend Jim Sanderson, of festive memory, was wont to serve at the Langham? Or, better still, the incomparable and super-delicious of Wales, fattened on the thyme and aromatic pastures of grand Old Snowdon. Oh! why is it, that save a saddle imported from England or Canada ready dressed, we can get no such meat in your good city of Gotham? And who is responsible for this sad privation? First, the breeder, whose uneducated palate leads him to sacrifice quality to quantity, and flavor to fatness, and who, in his barbarous ignorance, fancies the coarse-grained fat and tallowy carcass of a Cotswold makes as good mutton as four-year-old Southdown, and who accordingly breeds his native ewes to these large breeds, and drives the produce to market while the meat is yet pale and flavorless from immaturity. But it is not the farmer alone who is to blame in this matter. The butcher is equally criminal, except when he palms off yearling meat for spring lamb, or dresses a lean carcass with the fat from another sheep. He has no regard whatever to the age of the animal which he slaughters, provided always that he finds a profit in it. But the unpardonable sin of the butcher is that he will as often as not slaughter sheep while its stomach is yet more or less filled with undigested food, hence that horrible sheep—erroneously called wool-taste so common in New York mutton.

Speaking of this atrocity to Mr. Reybold, the famous peach-grower and sheep-breeder of Delaware, he explained the cause of this wooly taste very clearly. "If," said he, "there be even as much as a handful of undigested food in the stomach of a sheep, when slaughtered, it immediately enters into fermentation, and the gases so generated within an incredibly short time pervade the whole of the flesh, and imparts to it that taint vulgarly called the 'taste of the wool.'" Here is a hint to young sportsmen—old ones don't require it—never fail to

eviscerate any furred game which you may kill before it gets cold.

But, admit you by chance get a prime saddle of mutton, what becomes of it? In nine cases in ten you clap it into one of those infernal cast-iron contrivances called a cooking-range, from which it is withdrawn a sodden mass of baked meat utterly deprived of that divine osmazome which should be the diet in the next world of all great culinary artists, as a reward for the good they have done in this.

Though doubtless there are many exceptions, I never have met, in the whole course of my experience at the North, but two gentlemen who fed and slaughtered their own mutton; but then they were accomplished, traveled men, with palates educated to distinguish between sheep-meat and mutton. Thrice blessed are they who have tasted the five-year-old Southdown mutton of Mr. Webster, at Marshfield, and the succulent grade mutton of Mr. Edwin Thorne, at Thorndale. In the Southern States it was different, or rather was far different in the ante bellum days. Good mutton at the watering-places, in the mountains and on the plantations of Maryland and Virginia, was the rule and not the exception, and this was natural because the mutton producers were large landed gentry, with educated palates, who abominated patent cooking stoves, and who competed with each other as eagerly in the production of good mutton as they did for the brush in a fox chase or a prize on the road track or cock-pit.

Who that ever visited the Berkeley Springs, in Morgan County, Virginia, does not retain an appreciative remembrance of the mutton, bred and fattened at the Bower, the famous Dandridge estate in Western Virginia, and buried in ice for days before being served on the table, roasted before a quick wood fire, with that consummate judgment which the experience of years alone can give to old Aunt Dinah or Polly! the sable divinities of the kitchen?

And who, who has ever tasted it, can forget the mutton of the Eastern Shore of Maryland, bred by a Lloyd or a Oharley Tilghman, slaughtered by a Turner, and served at the Maryland Club, with Otto Williams in the chair, with Jim Carroll on his right hand and Harry on his left!

F. G. S.

## MUSHROOMS AGAIN.

WE have in this country (England), many species that are more or less fit for food, but owing to the imperfect knowledge which the generality of people possess respecting them, they are for the most part neglected. Fungi are much used as food in Australia by the natives, and kangaroos are said to search for and devour them with avidity, while in Terra del Fuego a species of *Cyrtaria* (*U. Darwinii*) forms the most substantial food of the natives during lengthened periods. In Northern Europe many different species of Fungi form a staple article of daily food. In Norway, Sweden and Russia species that are here considered either poisonous or worthless are there preserved in large quantities for use during severe and protracted winters. Among the kinds most used for food in Northern Europe we may instance various *Agarics*, as *A. deliciousus*, *A. Rosula* and *A. melleus*. Three or four species of *Boletus* are also regularly eaten in large quantities. In Russia all the edible species, and many which we regard, as a rule, as unwholesome, are either grilled with butter and oil, or boiled in water, and then preserved for several months in vinegar, highly seasoned with pepper and other condiments. This last plan is a tolerably safe one for testing questionable species. Tons of edible mushrooms are annually dried in ovens for winter supply in Northern Europe, where gigantic pine forests furnish ample supplies. We are, therefore, much behind our neighbors as regards the conversion of fungi into wholesome food. The only kinds at present used either in this country or in France are the common field mushroom (*Agaricus campestris*), horse mushroom (*A. arenarius*), Truffle (*Tuber estivum*) Morel (*Morchella esculenta*), and occasionally *Agaricus personatus*. In addition to these we have repeatedly eaten the vegetable beefsteak (*Pistulina hepatica*), a fleshy parasite on the common Oak, the gray from which is most delicious; the taste of the Fungus itself, however, more resembling that of a bullock's liver than a juicy steak. *Agaricus procerus*, the parsnip or partridge-breasted mushroom, with its near ally *A. rhododes*, we have repeatedly eaten stewed in milk, much to the horror of our friends. Although both are superior to the best cultivated mushrooms as regards delicacy and flavor. The pretty little fairy-ring champignon (*Marasmius oreades*) often found abundantly in pastures, is one of the best of all the edible kinds, either when eaten fresh, or when dried for stews and soups. In addition to these we have *Boletus edulis*, *B. scaber*, *B. flavus*, Gigantic Puff-ball (*Lycoperdon giganteum*), *Cantharellus cibarius*, *Lactarius deliciosus* and *Hydnum repandum*, besides many others less generally known as respects their esculent qualities. In recommending Fungi as food-plants, we have to contend against two of the greatest obstacles to progress—ignorance and deeply-rooted prejudice; but we hope yet to see the time when both good and bad Fungi will be better known than at present. In selecting Fungi for food the recent cases of poisoning show that caution must be exercised, or unpleasant consequences may be the result. Nevertheless, most of the species which we have named are easily recognized without any special knowledge, and they are all not only palatable but in many cases, when nicely cooked, delicious. It is perhaps too much to expect that elementary lessons on botany should be given in our schools, but it seems an oversight to send youngsters adrift without any knowledge of our commonest food-producing plants. Our best authorities agree that edible Fungi possess nutritious properties in a very high degree, and it is to be regretted that valuable food should be lost in large quantities, simply because we lack the knowledge necessary for its collection and utilization.—*The Garden, London, Eng.*

PRESERVATION OF FORESTS.—The Forest Association of Chicago has presented memorials to both Congress and the Senate, advising the appointment by those bodies of a competent commission to proceed to Europe and examine the forestry regulations of the different countries there. The object is the adoption of such of the European legislation as may be employed in our own country for the preservation and cultivation of American forests. The matter has been referred to the Committee on Agriculture. It is to be hoped that the present movement may not be confined to the committee rooms. The statistics contained in the last number of *Scribner's* incidentally referred to by us last week, together with others equally suggestive, should contain sufficient warning to insure some effective action in the matter on the part of our legislators.

\* Lecture by Rev. W. Tuckwell before the Somersetshire Archaeological and Natural History Society.

**NEW YORK HORTICULTURAL SOCIETY.**—The regular monthly meeting and annual election was held Tuesday, Dec 4, at their rooms, 55 W. 33d street. The following gentlemen were elected officers for the ensuing year: President, James M. Paterson, Newark, N. J.; Vice-Presidents—R. H. Rathbun, South Amboy, N. J.; Wilson G. Hunt, N. Y.; Thos. C. Acton, N. Y.; C. C. Olney, N. Y.; Treasurer, Isaac H. Young, N. Y.; Corresponding Secretary, L. M. Delamater, N. Y.; Recording Secretary, W. J. Davidson, Brooklyn, N. Y. The gentlemen elected for the various committees are all thoroughly posted in everything connected with their various duties, and we prophesy a still further success for the N. Y. Horticultural Society for the ensuing year.

**NOTICE TO SPORTSMEN.**—Having received so many communications asking us for information in regard to our six-section bamboo trout, black bass, grise and salmon rods, we have prepared a circular on the subject, which we shall take pleasure in forwarding to any address. We keep on hand all grades, the prices of which range from \$15 to \$150. We put our stamp only on the best, in order to protect our customers and our reputation, for we are unwilling to sell a poor rod with a false enamel (made by burning and staining to imitate the genuine article) without letting our customers know just what they are getting.

F. O. Box 1,294.—(Adv.) ABBEY & IMBRIE, 38 Maiden Lane.

## The Kennel.

**TO CORRESPONDENTS.**—Those desiring us to prescribe for their dogs will please take note of and describe the following points in each animal:

1. Age.
2. Food and medicine given.
3. Appearance of the eye;
4. Any changes in the appearance of the coat; of the tongue and lips.
5. Breathing of the body, as bloating, drawing in of the flanks, etc.
6. Condition of the bowels and secretions of the kidneys, color, etc.
7. Appetite; regular, variable, etc.
8. Temperature of the body as indicated by the bulb of the thermometer when placed between the body and the forearm.
9. Give position of kennel and surroundings, outlook, contiguity to other buildings, and the uses of the latter. Also give any peculiarities of temperament, movements, etc., that may be noticed; signs of suffering, etc.

## PHILADELPHIA DOG SHOW.

PERHAPS it would be wise, before entering into the special details of the bench show in Philadelphia, to give, somewhat briefly, our ideas in regard to such weight as the decisions of judges may have upon the merits of dogs. We beg to remark that such opinions as we may advance are by no means to be considered as applicable to the Philadelphia bench show alone, but to all shows. Of course there is the absolute necessity that some particular body of gentlemen, known, firstly for their probity, and secondly for their knowledge, should be organized, which body shall have the power to pass judgment. As diplomas are given in colleges which owe their value to the worth and acquirements of the professors, exactly the same machinery is brought into play when awards are given to animals. Still, like all human matters, such organized bodies, whether judging of the personal merits of men or dogs, are subject to errors. Man's appreciation of mundane matters is not always the same, and so comparing again college graduations and certificates of excellence given to dogs, other than in field trials, it often happens that a dog which passes first in one bench show, sometimes is the recipient of a third or fourth award, or is occasionally entirely passed over in other shows; hence the frequent heart-burnings which invariably follow the decisions of the judges at bench shows. A good deal of caviling invariably follows the decisions of the judges, which, when sifted out, amounts to little or nothing. Sometimes the idea is advanced that journals devoted to sporting topics, have a certain influence over judges; even that newspapers endeavor to control such appointments as are made. We must repel such aspersions with scorn, not only for ourselves but for all our contemporaries. As for the FOREST AND STREAM AND ROD AND GUN, though we may own dogs, we have never allowed one to be exhibited, and as long as we conduct our paper we never will. Still we do not mean by this to state that any gentlemen attached to journals devoting their attention to legitimate sport, shall not exhibit dogs; still, for ourselves, we must decline putting in prominence any animals we may be possessed of. Returning again to the powers vested in certain gentlemen to decide on the merits of animals, we must remark that we have yet to find out, after the most careful scrutiny, that a single decision has ever been made which was brought about in any other than the most honorable way. Of course we, like any one else, may differ occasionally from such judgments; but we are just as likely to be mistaken as any one else, and we are the last to set up any *ex cathedra* dicta of our own. There seems, however, to be this trouble about it: There are many States where very nice dogs abound, and in several instances we have been asked how matters should be managed when no kennel club existed and where the desire was expressed to have a bench show. In all these cases we have expressed ourselves in regard to the appointment of judges as follows, "Do not decide upon the appointment of judges until all your exhibitors are present; then call a general meeting, and, having made a ticket of judges, excluding all newspaper men save in an honorary capacity, choose, by a ballot of exhibitors, who shall be the judges." If this does not give the authority which a kennel club imparts to awards, it is the very next best thing to do. Of course the rules to be adopted must be the same as those enforced by the National American Kennel Club. As to exhibitors themselves being judges, we see no harm in having in a judge of setters a person having pointers on exhibition, though plenty of gentlemen can be found who have no

direct interest in the animals exhibited. As to the awards given in Philadelphia, we consider them just as worthy of credit, from the sportsmanlike knowledge, loyalty and high social position of the judges there, as if given by the most prominent English kennel club, quite indifferent as to whether the Pennsylvania Kennel Club was founded a century ago or was an organization of but yesterday.

Perhaps the locality of the Philadelphia show was a trifle too small for the number of dogs, and the piling of one dog above another was confusing. Still it should be remembered that Mr. Goddard, the manager, had, at the last moment, sent to him many more dogs than he expected; and so the arrangement was the best that could be made.

In the champion English setters, Mr. Morris' Lark, showing the fine race due to Mr. Raymond's stock, was a good winner; in the bitches, Mr. Gumbes' Fairy II, white and orange, was worthy of the award, though we deem her a trifle too fine, showing somewhat the bad effects of too close breeding. Among the champion Gordon setters, Mr. Tileston's Lou is a good animal, though we have always deemed the short head and blunt muzzle she carries as a defect; but we must state that this is occasionally a characteristic of the Gordon. In discriminating on to the points of the Gordons, one of the highest total of figures is given precisely to the head of a Gordon. We may remark here that generally the Gordons at the show were not good. The typical colors—the true black and tan—were not well marked. In class 5, imported setters, or the progeny of a first generation, Mr. Tileston's Frank was an easy winner. Frank is a good choice animal, showing power and strength. If not very fine he is put together admirably well, and is an animal with no end of sterling qualities. In the second prize awarded to Fame, there was another dog, Nick, which we deemed a close competitor. The No. 9 in the catalogue, Mr. Colket's Echo, was a wonderful dog for size and peculiar beauty of head; but we are afraid his huge proportions might have incapacitated him from work, though we had occasionally seen these Brobdingnagian brutes who, if not fast, were close and steady plodders. We suppose Echo to be among the biggest of the Laverack get. Of native English setters, Major Brown's Grouse was an admirable example. Grouse is simply a superb dog, with no end of fine points. What stock Grouse comes from, we could not determine. Perfectly unknown, it speaks well of the knowledge of the Philadelphia judges that Grouse should have been selected as first in a class of some fifty-five dogs. The No. 36, Ned, was a fair choice for second, though Mr. Waltman's Bismarck, a lovely white and lemon, might dispute the palm. The No. 23, Don, and the No. 20, Dash, were very good animals.

In native English setters, bitches, Mr. Hunn's Lill was a fairish dog, though Flora, belonging to Mr. J. B. Bradley, was a good first. Mr. Hardy's Daisy, we think, was so close to Flora that there would have been little to choose between them. We are, however, pretty certain that the thorough examination given to these dogs by the judges, showed some points in Flora which Daisy did not have. No. 66, Mr. H. P. Norris' Letitia, with the curious black rims around the eyes, a beautiful beast, was properly commended. In dog puppies, class 6, Dash, an eight months puppy, was a good little fellow, though the Nos. 82 and 83, Frank and Sam, would run him close as to prettiness. Mr. Packer's Clyde was as likely a puppy as we would want to see. In bitch puppies, 87, Dr. Dolan's Gyp would have been our choice. In Irish setters, class 7, Mr. Ellis' Guy was a perfect choice. We have rarely seen a "red" better put together, or with a finer mansarded head. We would highly recommend Guy's progeny. We should judge, if not too high strung, he would be admirable in the field. The No. 96, Mr. Fassitt's Sport, we did not admire; his spunk for a puppy was good, though he was hardly as well bred a dog as the No. 96. In native red or red and white setters, Irish or cross, class 8, the No. 100, Mr. J. W. Fassitt's Jim, was a good winner, as he deserved. 109, Mr. Morris' Don Juan, we thought, ought to have a higher recognition for his good style, though 117, Mr. Davis' Glen, was a choice animal. In native bitches, class 8, Mr. McLinden's Nellie would have been all right, if not for having been a trifle off color. 120, Mr. Ash's June was a good one, and perhaps a shade better. For puppies, Mr. R. Torpin's Prince was a good selection. In class 8, Mr. Johnson's Belle was a fairish animal. In class 9, a general class of Gordons, we were not favorably impressed. Mr. Struther's Sport was off color every way; Mr. Bergen's Don was better. The class was evidently a difficult one to manage and the choice troublesome to make. If there are good Gordons in Philadelphia they were not on exhibition. In bitches, Midge, a winner, was only fair, though she was very much superior to Belle, the second winner. In class 10, pointers of fifty pounds and over, there were no end of very fine dogs. The winner, 160, Mr. Staiger's Frank, a liver and white mixed, ought to have had a hundred prizes, so fine is he, and the judges showed their acumen in making him first. If space allowed, we might devote no end of it to Frank's choice traits and fine qualities. The No. 142, Mr. C. W. Emerson's Shot, deserved the second prize. But we must not forget the No. 144, Mr. Ehinger's Buogo, a capital animal in every way. No. 147, Mr. Edwards' Trim, for strength and power is a good example of the old-fashioned pointer. In the bitches, class 10, Rose, though alone of her sex, deserved her prize. In class 11, pointers under fifty pounds, Mr. Hellmich's Dan was good in every way. In the bitches, Mr. W. Copeland's Juno, a white, lemon and roan flecked, had a lovely head and was superb all over, showing strength of limb and power of work. Mr. Tileston's 174 was a fair second, though we might have preferred the No. 176—Mr. Ely's Nel-

lie. We think she had higher merit than 174. In regard to puppies, Mr. Hellmich's Blick, No. 177, there could not have been two opinions as to Blick being the first choice.

For special prizes for the best stud pointer, Mr. Hellmich's Dan was just as it should have been. Dan is a noble brute with the right kind of a head and good form of body, and, we believe, imparted to his progeny all his good qualities. Grouse, whose excellent qualities we have before announced came in for a third special. Mr. Frank Furness' Frank, for best stud setter, with two of his get, made as fine a trio of dogs as could be shown in any exhibition. As good big fellows, Mr. Furness' dogs are beauties, and have all those sterling qualities, which, at a single glance, are readily appreciable to a sportsman's eye.

In the class 14, water spaniels, there was some difficulty as to classification of dogs. It seems so strange that men should own dogs and not discriminate as to breeds. Water spaniel field spaniels, cockers, springers, were all mixed up. Some subdivision having been accomplished, judging was made easy. Generally, the collection was not first-class, and for water spaniels no award was given. Nellie was a fairish dog but undersized, we thought. The No. 192, Lady, owned by Mr. J. McIntyre, was a very nice animal. Lady showed signs of work, as her nose had been rubbed clear of hair. The fairness of the judges and their knowledge was shown in this choice, as Lady was brought in by her owner just as she was taken from work. The No. 205, Mr. McGargy's Dog was a nice brute, as was 208, Mr. Heywood's dog. In fox hounds, as we noticed in our first article, the exhibition was superb. A finer selection than the Rose Tree pack cannot be found in the United States. As a club, the Rose Tree pack is about ten years old, and the most judicious drafting has been made. Every award was appropriately given in this class, the Rose Tree pack and Mr. Rawlings' and Mr. Clayton's dogs coming in for prizes. We often receive letters from Southern gentlemen, wanting a new infusion of blood in their packs. Here is where it should come from. Southern hounds in time run, we think, a little too fine and tickere. It is with these Pennsylvania dogs that a stronger impression, a lustier streak, can be acquired. We understand that with all of these packs *even running* (not one dog fast and one dog slow) is what is looked for. Some of our valued New York and Long Island packs scatter out in the field like the streamers of an aurora borealis. What is wanted is even-paced dogs, running all together. The Pennsylvania blue stock is due to the Gould strain, and the Tan stock came from Scragg on the Susquehanna.

Beagles, in the show, were, all of them, too close to their progenitors the fox hounds, being too big. We want beagles of such a size that a man with two big pockets can stow away a half dozen dogs in these receptacles. We require then a microcosm of a fox hound somewhat, with legs shorter and little bowed, to hold his weight. In bitches, 223, a prize winner had not the proper ear. The beagle ear should not be pointed, but have a full round swoop. The No. 228, Queen, was a better type, and the No. 231, Mr. Pownall's Jack, though a little wrong otherwise, had a proper ear. We do not think any one in the country has a better knowledge of the dachshund than Dr. Twaddell, nor a choicer strain of these dogs. There are no end of fine points about a dachshund. We want bone, plenty of it, and a fine coat and a choice head, a long rounded ear, which must hang close to the cheek, though when you look at the back of the head it must swoop out. The dog must have a fairly big shoulder blade, strong legs, and claws big enough for a beast of twice his size. Dr. Twaddell, though his order of merit was somewhat reversed, called almost all the fruits of victory. Unfortunately there came too late for entry a noble pair of dachshunds of a larger size, owned by Mr. Lester—Puck and Nellie—who would have gained prizes if they had not been forcibly ruled out. In greyhounds, class 20, Mr. C. T. Yerkes' Leo, a first, No. 216, was a good winner, though unfortunately entered among miscellaneous dogs. The No. 463, a fawn greyhound, Pat, we are quite positive was as good, if not a better dog. This whole collection of greyhounds was quite choice. There were but two entries (regular ones) in class 18, fox terriers. Neither of the dogs were fine pointed enough as to nose, though one dog, the second prize, was beautifully marked with his white ears. For Italian greyhounds Mr. E. L. Campbell's Vic, the No. 249, deserved the award she received.

In Newfoundlands there was some grumbling as to the awards. We have always insisted that the amount of bawling as to Newfoundlands in dog shows was immense. The true Newfoundland is not a big dog, and ought not to be curly haired. Though entered as one class in the Philadelphia show, we think a very proper discrimination was made in sizes by the judges, Messrs. Wister, England and Furness. One class was made of the big dogs, called the St. Johns, and another of the smaller dogs, the true Newfoundland or black Labrador. The best big dog and the choicest small dog were selected as first and second prize, each one being the best of his kind, Mr. Picot's dog winning the second prize. The collection was excellent and the awards judicious. Pug fanciers must recollect that jolling toyzugs are at a discount nowadays, and that medium sizes are what are wanted. In Scotch terriers the show was profuse, and Jack was a good winner. In the Skyes, a difficult class, for there were many of them, the No. 417, Dr. W. Sanderson's Donald, was the proper prize winner. The time will come soon when we must have special shows of peculiar classes, and we think regard to these fancy breeds of dogs, Philadelphia can ably

and better animals than New York. In mastiffs, Mr. J. J. Bennett's Glen was a good one, though run close by Mrs. J. J. Bennett's Rover; only that we have yet to see real choice mastiffs in the United States. Our dogs are close to English mastiffs, but would gain no prizes in the English show bench. In St. Bernards we should have given, undoubtedly, first prize to Don.

Having spent a good deal of time over the dogs exhibited in Philadelphia, we are quite sure that the decisions were just, and given without partiality. To the manager, Mr. Thatcher Goddard, our thanks are specially due for many acts of courtesy. We can scarcely imagine a task more thankless, or no more fraught with troubles than to carry out a dog show. To have managed one very successfully in Philadelphia, is no small thing. Throughout the five days of the Philadelphia dog show, Horticultural Hall was well filled with highly appreciative audiences, and, believing that sportsmen in Pennsylvania are greatly indebted to Mr. Goddard for having first conceived the idea of a dog show in the second city of the Union, and pleased to state that in every way the show was conducted in a most honorable way, we now await the next great canine event, the St. Louis Exhibition.

**Catalogue of the Entries and Winners at the Philadelphia Dog Show, held at Horticultural Hall, Philadelphia, Nov. 26th, 27th, 28th, 29th and 30th.**

**Division I.—Sporting Dogs—Champion Classes—Dogs who have won 1st Premiums at any recognized Bench Show.**

**Class 1.—Champion English Setters, Dogs—P H Morris, N Y, 4 yrs, by Brooks' Phil, out of Raymond's Dido, 1st prize.**

**Bitches—Wm H Gumbles, Phila, Fairy II, white and orange, 4 yrs, full pedigree, 1st prize.**

**Class 2.—Champion Irish Setters—No entries.**

**Class 3.—Champion Gordon Setters, Bitches—Wm M Tilston, N Y, Lou, black and tan, 3 yrs, 1st prize.**

**Class 4.—Champion Pointers, Dogs—Wm M Tilston, N Y, Snapshot, 3 yrs, by Whitehouse's Rap, out of Price's Judy, full pedigree, and winner in many shows, 1st prize.**

Bitches—A W Sloane, Phila, Fannie, 2 yrs; W Duke Murphy, Phila, Muff, 7 mos; P McGrath, Phila, Gyp, 5 mos.

Class 34.—Long or Silk-Haired Terriers—No entries.

Class 35.—Miscellaneous Dogs—N W Thorp, Phila, Fred 3 yrs; Mrs E Breckford, Phila, Beauty, 2½ yrs; Miss G E McKall, Phila, Pat, 19 mos; B E Walton, Phila, Tip, 2½ yrs; Wm L Elkins, Phila, Ponder, 6 mos; J F Tribbit, Phila, Tip, 3 mos; Thos Leaming, Phila, Frank, 8 years, 2d prize; Geo Stellwagen, Phila, Reno 3 yrs; F Meyer, Phila, Sultan, 3½ years; Wm Galbraith, Phila, Jocko, 6 yrs; Simp, 10 mos; J Collins Duncan, Phila, Fritz, 7 mos; A Priestley, Phila, Prince; W S Armstrong, Phila, Lion; F S Miller, Phila, Little Mac; Mrs Walterford, Phila, Prince; Chas Thomas, Phila, Lion; Wm Saunders, Phila, Rover, 3½ yrs; Dot, 2½ yrs; Spunkie, 3½ yrs; Geo W Simpson, Phila, Tip, black and tan; Christ, Hamble, Camden, Moike, 1½ yrs; Alexander Glass, Phila, Wolf, 3 yrs; Coleman's Bob, 1st prize.

Miscellaneous Bitches—Geo A Russell, Phila, Jock, 3½ yrs; Harrington Fitzgerald, Phila, Pinkie, 1 yr; Richard Robertson, Camden, N J, Budd, 16 mos; J W Aldridge, Phila, Fussee, highly commended; Gottlieb Coits, Phila, Rose, 1 yr; Joseph Mareden, Phila, Nellie, 3 yrs; H Thorbecke, Phila, Fanny, 3 yrs; Geo C Rodgers, Phila, Tip, 3½ yrs; 3d pr; Wm Jones, Phila, Mip, 2 yrs; Wm Sides, Duff, 4 yrs; Mrs J W Bates, Phila, Jet, 2 yrs; G Dawson Coleman, Phila, Bob, deerhound, 1st 4½ yrs, prize.

Class 36.—Performing Dogs.

SPECIAL PRIZES.—The special prize offered for the best stud pointer, with two of his get, was awarded to Max Hellmich's Dan. The prize was a silver pitcher, valued at \$175, presented by Mr Thomas W Sparks of Philadelphia. The second special prize, a painting by James B Sward, value \$100, was awarded for best setter to P H Morris, of New York, for Lark. Major J M Brown's Grouse was awarded third, special prize (a silver fruit dish) for best native setter dog, over a year old. Snapshot, Mr Tilsten's dog, took special prize (silver collar) for best pointer, and Jacob Stager's Frank a silver fruit dish, also for pointer, barring champions. A revolver and case was awarded Mr Frank Furness' dog Frank for best stud setter, with two of his get, over six months of age. For best pointer over 50 pounds (excluding champions), a piece of silver was awarded Jacob Stager's dog Frank. William Copeland's Time received a revolver and case for best pointer under 50 pounds.

FRANK.—The Irish pointer dog Frank, exhibited at the Philadelphia show by Wm. W. Porter, of that city, attracted much attention. The dog shows fine points and high breeding, is lemon and white in color, weighs about 65 lbs., and is valued at \$250.—*Ad.*

## DOGS' REASONING FACULTIES.

SPOTTSYLVANIA Co., Va., Nov. 23, 1877.

EDITOR FOREST AND STREAM AND ROD AND GUN:

I feel as though I wanted to say something of the power of dogs to reason. I cannot help thinking they have this faculty, or if they do not have it they have something so near akin to it, that had I the power I would like to impart that something they do possess, in lieu of the commodity possessed by some of my human acquaintances, and designated reason.

Let me relate an incident or so which happened under my observation among my own dogs, setters and pointers. I bred and owned, in the years 1856-57, a well-bred Virginia setter, who, owing to his propensity for getting into broils and scrapes, was called "Rowdy." Returning one chilly November evening from an all-day's tramp after partridges, I stopped at our village-doctor's office, and as he was a bachelor I allowed my dog to follow me into the office to enjoy with me his nice hickory fire, which I had seen so cheerily shining and blazing through the window. I found in the office with the doctor two of my young friends who were eager to have a chat with me about my day's sport. My dog stretched himself before the fire, and so soon as I had removed my boots, I drew a chair up in front of the fire and placed a foot upon either side of the dog, for the purpose of drying them, for they were quite damp. The fire soon became unpleasantly hot for the dog's bare nose, and for an instant, thinking the nose at fault instead of himself (people do the same thing sometimes), he began to scratch it with his claws vigorously; failing to get relief, he covered his nose with his feet, and for the moment "was happy." To teach him good-manners I gave the coals under the wood a gentle stir, which made the heat become so oppressive to my friend as to cause him to spring with a rude bark and much pawing into the centre of the room, much to the amusement of the company. After cooling off a little I observed him looking very intently, first at my feet and then into my face, all the while wagging his faithful tail, and uttering a low, distressed whine. Thinking he had not entirely recovered from the disturbing influence of the fire, and not being altogether satisfied with my part in the matter, I said nothing. I was, however, you may conceive, much surprised to see him approach my right foot, which was smoking near the fire, and with his forefeet drag it away; and this he persisted in doing so often as I replaced it, and when I ordered him to let it alone he immediately resumed operations upon the other foot, trying to place it in safety. Be assured I keenly felt the rebuke, and now, after a lapse of twenty years, I would not be caught in the same scrape, and feel the remorse I then felt, for fifty dollars. Yes, it is pleasant for me to think (let others think as they will) that my honest friends can reason, and in this case, without intending it, was able and did administer a sharp and well-deserved rebuke. I had the great sorrow to shoot, for some horrible distemper, fall before last, a fine, glossy black setter, bred by myself, and over which I shot for three seasons, hunting him on partridges and woodcock. This dog I never broke; he broke himself, and was perfectly reliable upon every thing, be it either fur or feather. "Jim Morris" took it into his head that it was disagreeable to me to dismount from my horse, or stoop down to receive a retrieved bird from him, and with great care and dignity would rear up and deliver his game to me. This dog I hunted so hard one fall that every chance he got he would indulge himself in long naps, and would snore like a steam-wheel steamer. Often he would spring up from one of these naps, pause a moment and listen, and then, with great stateliness, walk to the stable and look into my riding-mare's box; if she was present he would

take himself back to the house-porch and finish his nap; but if she was absent—Well! there was a snort, an earthquake, a greased streak of lightning, and master and dog were together. I have a two-year-old son of his, but they don't breed his sort any more. I could keep this clatter up for an hour, but know you have other use for your valuable space. Before I close, however, let me say to those who think a dog has no reason, or something near akin to it; that he cannot feel a needless insult, or appreciate a kindness offered; that he cannot teach you many things, such as patience, perseverance to endure privation, to bear pain, fatigue, etc.;—that their experience has been very widely at variance from that of

Yours very respectfully,

BIRD SHOT.

DEATH FROM A FOX BITE.—In the *San Antonio Express*, an account is given of the death of a boy from a fox bite.

The boy was bathing, and on going out of the water was attacked and bitten by a fox. The fox was killed. The boy's wounds were dressed, and he was apparently getting well, when some sixty days afterwards he complained of feeling unwell and died. "It is believed," says the *Express*, "that the boy's death was caused by hydrophobia."

It is not at all certain that the boy died of hydrophobia, it might have been a case of tetanus. The question whether other animals than dogs have rabies, we do not consider as yet to have been fully decided. Now that this case of a bite from a fox is mentioned, it may be stated that people are said to have died from bites inflicted by wolves, by cats, and even horses. Certain cases of hydrophobia, brought on by wounds received from a cat, seem to bear some semblance of truth; at least the diagnosis of the disease resembles exactly that of hydrophobia. A somewhat strange statement was made some months ago by Lieutenant Colonel Dodge, U. S. A., who asserts that the bite of the skunk (*Mephitis Americana*) is fatal. Colonel Dodge does not think that death arises to individuals who are bitten by the skunk, because the skunk is afflicted by any malady, but that all skunks are venomous. Colonel Dodge writes as follows:

"I am convinced that the terrible disease is the natural result to man of the bite of the skunk (in the territory designated; Dakota, we believe); and that, while inflicting it on the person bitten, it does not follow that the skunk is himself afflicted with the malady. I judge this to be the case; firstly, from the fact that skunks are very numerous in the valleys of the Arkansas and its tributaries, whilst the number of men bitten each year, with fatal result, is so great and so widely separated, both in location and time, as to indicate an epidemic amongst the skunks, if each were equally rabid, that would soon exterminate the whole race; secondly, from the actions of the biting animals. The bite is not the senseless snap of a rabid animal, but is the result of appetite. The skunk comes into camp in search of food, deliberately sits down on the hand or face of a man, and begins eating. If disturbed, he cocks his tail and stands on the defence; but if a fire is made, or a candle lit, or he is alarmed by noise or bustle, he scampers off into the darkness to return again when all is quiet. Thirdly, that, though I have seen many dogs bitten by skunks, I have never known a dog or other lower animal to go mad from such a bite."

Until the matter is further studied, we must doubt that the bite of the skunk is fatal. In certain northern portions of the United States this creature still exists, and we hardly remember to have heard any cases of death arising from the bite of the *Mephitis Americana*. It should be remembered that of late years this animal has been a great deal hunted for its skin. In regard to wolves, the Indians believe in hydrophobic wolves.

THE COST OF RAISING AND BREAKING DOGS.—I am inclined to write you a brief letter upon a subject concerning which many sportsmen are entirely ignorant—it is the cost of raising and breaking sporting dogs. Many may feel indifferent as to whether it costs much or little, but to us who are interested in breeding, and who occasionally sell a pup or a broken dog, this question is not void of interest. When I advertise a lot of well-bred pups at \$30 each or \$75, I know that I am only getting my money back, and sometimes not that. A few days ago a gentleman in the Southwest corresponded with me relative to buying a broken setter dog. My price was \$60 (just about actual cost of breaking). In his reply he said: "I do not consider a native setter worth much more than the cost of breaking—say \$35." Now, this gentleman has either broken but few dogs, or he estimates his time as of little value. Let us suppose, for an illustration:

|   |          |
|---|----------|
| One pup (native), value at six weeks.....                     | \$15 00  |
| Keeping until five months old, 35c. per week.....             | 5 00     |
| House-breaking, 30 days, the paltry sum of.....               | 15 00    |
| Four months' actual work in the field, at \$15 per month..... | 60 00    |
| Dog's keeping, six months.....                                | 12 00    |
| Total.....  | \$107 00 |

Suppose I pay \$5 to advertise this dog, and at last sell him for \$75, where is my profit?

I hear some one say: Why do you sell dogs if it is a losing business? My answer is, we do not estimate time in counting the cost of the dog, only the actual cash out.

Now, let us try to illustrate the value of an imported dog, or of a young dog from the fancy English and Irish stock. I will illustrate it best by my own actual experience with three:

|  |          |
|--|----------|
| Dr to—   |          |
| 1 red Irish dog pup, kennel of Arnold Burgess..... | \$35 00  |
| 1 Irish bitch pup, kennel of Jesse Sherwood.....   | 35 00    |
| 1 red Irish dog pup, kennel of A. C. Waddell.....  | 35 00    |
| Express charges on the three.....                  | 12 00    |
| House-breaking the three.....                      | 35 00    |
| Field-breaking one.....                            | 25 00    |
| Keeping.....                                       | 15 00    |
| Total.....   | \$192 00 |

Losses by death:

|                                    |          |
|------------------------------------|----------|
| 2 pups, \$33 each, first cost..... | \$70 00  |
| 1 bitch broken and offered at..... | 65 00    |
| Actual loss.....                   | \$127 00 |

I have invested several hundred dollars in dogs, and so far my experience has taught me that there is but little to be made in breeding or breaking dogs. I could name many gentlemen who have had like experience. I have been led to

write this, not to bewail my losses, for I can stand that; not to find fault, for I have no fault to find; but merely to explain why a well-bred and well-broken dog is worth \$250. Ask Mr. David Sanborn how much it cost to break Nellie, the champion at Hampton. Probably he would not tell you, but, if he values his time at mechanic's wages, \$350 would not reimburse him for it. "Fools rush in where angels fear to tread." So I beg of you, my dear brother sportsmen, do not entertain the notion that we dog-men are getting rich, and then invest your bottom dollar in starting a new kennel. If you own a good pup and have no time to break it, I can name a few men such as Waddington, Morgan, Whitford, and a dozen others who might be named, who know how to do it, and if they ask you \$75 or \$100 for educating your dog ready for use, don't begrudge the money. The reason why there are so many half-broken dogs in the country, is simply because the average sportsman expects them to grow like mushrooms in one night.

I expect this letter to be criticised even worse than my little pamphlet, called "Hints on Dog-Breaking," was, but that does not matter if it only throws light on a subject that has been hid so long.—W. H. Holabird, in *Chicago Field*.

A DOG'S CONSIDERATE REGARD.—There is a very knowing dog, and also a very grateful one, in Newhaven (England). I am acquainted with his case, because I am on duty there and see the creature frequently. This dog, you must understand, is a Dalmatian, or spotted coach dog, which makes his history the more remarkable; for the breed is not noted for brains. Generally speaking, its accomplishments are limited to sleeping by your horse in the stable, and jumping at his nose when he is on the road. Well, this Dalmatian fell blind; he had a cataract on both eyes. He went groping about the streets and tumbling into gutters, until he stirred up the compassion of my brother in surgery, Beach. Beach, by the way, cares nothing about dogs; he has no fondness for them whatever. But he said it was a pity to see this wretch struggling and suffering in that style, if the thing could be helped. So he got hold of his subject, had him tied and chloroformed, operated on him, and removed the cataracts. The sight, in short, was restored completely.

Ever since then this Dalmatian has been a monster of gratitude, and absolutely worships and haunts and bores his benefactor. It isn't because Beach feeds him. Not at all. Beach isn't of that sort. He is not a dog-fancier nor a dog provider. He might think a dog wanted an operation, but he would never think he wanted a bone. Well, all the same, the Dalmatian adores him. He is a savage brute; he will bite any body else, including his master, but from Beach he will take any sort of maltreatment. Perhaps the most curious thing about the case is that he keeps some account of time, and knows the days of the week and hours of the day. This is very extraordinary, of course, but it is absolutely certain.

Beach, you must understand, lives out of town, and only comes in twice a week to attend to his duties there, once on Wednesday at ten in the morning, and once on Saturday, at three in the afternoon. Well, his old patient never fails to meet him on the right day and at the correct hour, just as accurately as though all Dalmatians were born with chronometers in their mouths. He never mistakes one day for another, and never goes on either day at the wrong hour. As Beach drives in, the dog meets him a little way out, follows him through his round, sits or stands by him, watches him devotedly, attends him homeward a certain distance, and then leaves him. Nobody can call him off, not even his master. By the way, if Beach comes to town by some unusual road, and so misses the dog, the latter immediately sets up a persistent search for him, going in succession to every one of his haunts, and among them to my quarters. How he has learned that Beach and I have some relation to each other, I don't know; but he has learned it perfectly, and is just as mindful of it as either of us.

Once I undertook, just for the curiosity of the thing, to detain him in my office. I put my arms around him and held on with all my strength. The result was that after a violent tussle I found myself on the floor, and the big brute off like lightning after his dear Beach. Anybody else would have been badly bitten. He only spared me out of consideration for my obvious relations and my supposed intimacy with his benefactor.

Now, the beast's gratitude is perhaps nothing remarkable; a great many dogs show affection and remembrance of kindness. But how upon earth does this Dalmatian know the day of the week and the time of day?—*Atlantic Monthly*.

## DOGS THAT EAT FISH ONLY.

PHILADELPHIA, Pa., Nov. 25, 1877.

EDITOR FOREST AND STREAM:

While spending a few weeks on the shore of the Bay of Fundy, in Nova Scotia, in 1874, I learned a novel method of catching codfish, which was practiced by some farmers in that vicinity. At the time of low water, the farmer walks out on the dry flats and drives many stakes in the ground, to which he ties short lines, with hooks and bait. He then goes home to his accustomed duties. Soon the great tide rises, and covers the flats with forty or fifty feet of water. The adventurous fish, following the waters for forage and frolic, take the baited hooks, and then settle down to a quiet life." When the waters recede the fish are left high and dry, when the farmer, with his wheelbarrow, collects them and baits the hooks again. In this manner he obtains his supply of fish for the winter without much labor and loss of time, and without much sport. Many of these farmers live almost wholly on fish diet, and even their dogs know not the taste of meat. On one occasion, I, in company with several friends, stopped at the hospitable mansion of Mr. Bartow, a farmer, who lives on Cape D'Ore. As we drove from Parrsboro on that day, a distance of more than thirty miles, we carried, as a portion of our lunch, a leg of mutton. When Mr. Bartow's dog came up wagging his tail in friendly style, so characteristic of true welcome, we offered to him what remained of the leg of mutton. To our surprise and Mr. Bartow's amusement, the dog, after smelling the meat, turned away in disgust. Mr. Bartow, in explaining the defective appreciation of our favor by the dog stated that he was not accustomed to eat meat, as they seldom had it on their own table, living almost exclusively on fish diet. He said, "Try the dog with a piece of salt codfish after supper and he will not refuse it." J. W.

**NAME CLAIMED.**—Wm. B. Hall, of Lancaster, Pa., claims the names of Duke of York and Lancaster Belle for red Irish dog and bitch, whelped Aug. 27, 1877, by imported York out of Diffenderfer's Bess by Gallus' Dash, etc. W. B. HALL.

—I claim the name of Gwendolen for my black pointer bitch pup, born June 22, 1877. Gwendolen is by Strong's Pete, out of Woodbridge's Nell. F. CAMPBELL MOLLER.  
New York, Nov. 26.

**Peckskill, Nov. 26.**—I claim the names of Rossmore and Bertie for my setter puppies, 4 mos. old, color black and white and orange and white, out of my Fanchon by Crary's Nero, of Oshkosh, Wis. W. H. PIERCE.

—E. A. Spooner's orange and white bitch Joe, a litter sister to Mr. Marcello's Gace has been bred to Mr. P. H. Morris' champion dog Lark.

**COST OF TRANSPORTING DOGS FROM OMAHA TO SAN FRANCISCO.**—As questions as to transportation of dogs are frequently asked of us we publish the following:

OMAHA, Neb., Nov. 23, 1877.

**EDITORS FOREST AND STREAM:**

Referring to yours of 19th, the express company's charge for a dog, Omaha to San Francisco, is \$28 per 100 pounds, and proportionately down to 60 pound, below that weight somewhat higher—as for instance, 50 pounds, \$15; 25 pounds, \$8. This includes entire care and feed of animal. A gentleman traveling with a dog can have it taken in baggage car by paying usual fee to baggage men, one-half cent per mile. Yours truly,  
THOS. L. KIMBALL, Gen. Tick. Agt.

**Rose.**—Editor Forest and Stream:—I have just received from Mr. Skidmore, who purchased her for me, Cecil Moore's famous Rose. She is by champion Palmerston out of Flora. She was first at Belfast in a remarkably fine class, 1876; second at Cork, when out of condition from rearing her puppies; and just before leaving for this land, she bore off first prize at Bristol, England, dog show—these are the only times she has been shown. Rose, when in use, will be bred to my champion Elcho, sire of Berkeley, winner of second puppy stakes, 17 entries, at Hampton, and of Joe, Jr., winner of first in champion stakes, 30 entries, and second in brace stakes at late Nashville trials. I inform you of the death of my old Irish setter Dick, whose likeness appeared in your journal some two years ago. Dick was grandsire of Carrie II, winner of third in puppy stakes Hampton, and of Flint, fourth in champion and fourth in brace stakes, Nashville.

Respectfully,  
Wm. JARVIS.  
Claremont, N. H., Nov. 30, 1877.

**PHILADELPHIA CAT SHOW.**—This exhibition, held in Philadelphia last week, was a fair success. Among the cats on exhibition were specimens with two, three, five and six legs, also double-headed cats, matched quartets, quintets and sextets, prodigies and monstrosities. Angola, Caffre, caracal and chagran cats, tailless and earless cats, blue-eyed cats and cats with one blue and one brown eye, and cats with various numbers of toes and of all colors. The competition was principally as to weight and age, the largest weighing from fourteen to thirty pounds. The ages of some run up to twenty years, and there are animals two yards long. Among the leading felines we may mention Benny Huckle, the champion cat of New Jersey, as a fine specimen of the Maltese breed, weighing sixteen pounds; Tiger Dan, weighs fifteen pounds, and is twelve years old, and Taylor, a superb ring tail. One prize which the committee seem to have forgotten should have been to a noiseless cat, without propensities to yowl.

**A CAT BITE.**—From Springfield a case is reported, not fatal as yet, but attended, to the person bitten, with serious consequences. A house cat, belonging to M. E. Cabot, bit him on the 20th of September. About the second week in September a mad dog is said to have bitten this cat. Mr. Cabot's case is a peculiar one, since some of his family have been prone to mental hallucinations. We sincerely trust that the plan advised of using *curare*, and published by us in our last issue, will have a fair trial. Without advocating *curare*, we believe the theory of its use for hydrophobia is founded on good common sense.

## Answers to Correspondents.

### No Notice Taken of Anonymous Communications.

**177.** A number of anonymous correspondents will understand why their queries are not answered, when they read the lines at the head of this column.

**F. L. E., Hopkinsville.**—Is a choke-bore better for duck shooting? Ans. Would very much prefer a choke-bore.

**R. H. B., Middleton.**—Can you inform me where I can obtain South American bird skins? Ans. At Wallace's, 14 N. William St., N. Y.

**C. V. R. T.**—Please answer through your paper how many leaves the book entitled "Frank Schley's American Partridge and Pheasant Shooting" contains? Ans. 222 pages.

**J. H., Providence, R. I.**—The target you sent us we have examined. The No. 5 shot counts as a centre. Rule on paper target: If the shot breaks the black (not splits), it is a bull's eye. No. 5 does not break the black.

**C. R., Fredonia, Kansas.**—To whom shall I send prairie chickens, quail, ducks? Give me the name of a reliable party in your city? Ans. Send to Mr. E. G. Blackford, Fulton Market, New York. Have forwarded your letter.

**BACK ACTION.**—Do you consider the N and L make good? and how does it compare with the P? 2. Do you know any one in New York who has got one? Ans. 1. Both good guns. 2. Schuyler, Hartly & Graham have them.

**A. T. B., Roxborough.**—I have a bull pup, whose hair was taken off last summer by an acid put on to remove fleas. What will restore the hair? Ans. Probably cannot be restored if the acid was strong enough to destroy the hair follicles. Try any stimulating hair oil.

**F. A. P., Waterford.**—I want a first-class treatise on taxidermy. Give me some names of books with prices? Ans. Brown's Taxidermist's Manual, \$1, Orange Judd & Co.; Taxidermist's Manual, Hanley & Co., Nassau street, New York. Consult "Hallow's Gazetteer."

**J. A. D., Boston.**—My Newfoundland dog, one year and a half old, has a fashion of tearing clothes on lines and wherever he may find them. How shall I break him of it? Ans. Catch him at it and then give him a good thrashing on the spot. Repeat treatment as often as required.

**H. S., Boston.**—Have applied to the department for reports of the Wheeler expedition, and have not been successful. How can I obtain them? Ans. Write to the Member of the House of Representatives from your district asking for them. We believe they are very scarce, however.

**J. G. A.**—Will you please inform me how far a 250 grain naked ball is as accurate as a patched ball? If a ball strikes on a line it is counted to the higher number if it only cuts into that part? Ans. The patched ball is more accurate at all distances. If it cuts into the part it counts to the higher number.

**PLUMMER, Boston.**—1. Where can I obtain detailed account of choke-bore trials? 2. If each shot penetrates to the same depth, which is preferable for plover, No. 3 or No. 7? Ans. We have published innumerable choke-bore trials. Files of the London Field would give you the information. 2. The No. 8.

**READER, Wolf Run.**—1. How far does the average ball trap throw the glass balls? 2. How far does the Bogardus trap throw ordinarily? 3. Does Janer destroy the flesh of the ruffed grouse so as to be unfit for eating? Ans. 1. Ranges from 15 to 45 yards. 2. From 25 to 45 yards. 3. No; only imparts a pleasant bitter taste.

**C. B., Jersey City.**—I have two fawns. Can I find any book especially on deer? Ans. There are several works especially on the *Cervide*. Most any work on general natural history would give you the information. If you want to bring up the fawns, the surest thing would be to get practical details from the parks in New York and Brooklyn.

**INQUIRER, Franklin.**—Have a fine meerschaum; it won't color. Friends tell me to grease it when warm. Will this have the desired effect? Ans. No, you will spoil it. Must be boiled in wax, but it requires an adept. If bad meerschaum no amount of cooking would do it any good, no matter how great might be the genius of the smoker.

**MEMO.**—In answer to one of your correspondents who asks where he can get a breech-loading action with barrels, locks, etc., all ready for stoeking, I would say that he can be supplied with the very best work at reasonable rates by addressing Anthony Robinson, 44 Whitcomb St. Haymarket, London, England. CONESTOGA.

**J. M. D., Louisville.**—How are fish eggs impregnated? Ans. The absolute act of impregnation, though carefully studied, does not seem as yet to have been actually decided. It is believed by those who have devoted a great deal of observation to this subject that the issue of the eggs and the milt are simultaneous on the part of the female and male fish.

**W. S., Rouses Point.**—I have a dog which I think has both worms and mange. He is four years old. He looks badly. What shall I do? Ans. Cease feeding meat. Give some opening medicine—sulphur and compound cathartic pills—every second day for a week, and rub kerosene oil into the parts affected. Give plenty of exercise, and if this does not cure write again.

**H. R., Philadelphia.**—I am about purchasing a dog (pup), and am in a quandary as to which to choose, setter or pointer, and leave it to your kind decision to choose for me? Ans. Choke pointer or setter according to your taste, one is as good as the other. Purchase at any age from 3 mos. to 9 mos. Price varies, but \$25 to \$50 is fair. Color is, in the main, a mere question of individual taste. Consult our advertising columns.

**M. L. L., Shamokin, Pa.**—To waterproof clothing: Dissolve paraffine in naphtha or benzine, and soak thoroughly. Or, take half pound sugar of lead and half pound powdered alum; dissolve in a bucket of rain water; pour off into another bucket, and steep your articles in it; hang them up to dry without wringing them. To waterproof boots: 6 oz. mutton suet, 6 oz. beeswax, 4 oz. rosin, 1 pint linseed oil; melt first three together, and last.

**O. E. D., New York.**—I want to buy a rifle for ordinary shooting and target practice. Is there a breech-loading one whose shells I can load easily? If not what is the cheapest and best rifle, muzzle-loader and small bore? Is not the small bore better for common purposes than a large one? Ans. The Maynard rifle would be about the arm you want. The Maynard shells can be reloaded any number of times. Would advise the smaller bore for general purposes.

**T. J. B., Newport.**—To preserve bird skins for stuffing: Pass a thread through the wing bones and draw them nearly together, tying them in position. Cram eye holes full of cotton; wrap leg bones with same and draw them back in natural position. Dust whole flesh side of skin freely with dry arsenic and return the skin. Should neck become stiff and difficult to return soap it. Fill out the body; sew up skin; cross legs and tie them; wrap skin in shell cotton, or thin paper.

**W. P. S., Troy.**—In breeding dogs how near relatives can be used with prudence? Can father be put to daughter? Can son be put to mother? Can brother be put to sister? If these three questions are answered yes, then which is the most and which the least desirable? Ans. Close inbreeding is not desirable, and the relations you name are very objectionable—the last the least so, provided they are not of the same litter. Half-brother or sister by the same father is close enough.

**M. and M., Chillicothe, O.**—Our setter pup, one year old, has had for the past six months a white fleshy formation on lower part of his eyes, almost, at times, covering the entire pupil in one. And after hunting they become very much inflamed. His condition, in every other respect appears perfect. What can you suggest to remove this difficulty? Ans. Probably the use of some form of caustic is required, such as nitrate of silver or sulphate of copper. This should be done by an intelligent surgeon.

**SUBSCRIBER, Ohio.** 1. Will a cylindrical bore breech-loader shoot as close and hard as a good muzzle-loader? 2. For general shooting which is preferable, a choke-bore or open bore? and will the plain bore shoot as hard as choke? 3. In loading paper shells what size wad is best for over shot, 11 or 12? Ans. 1. It will not. 2. In open country a choke-bore is preferable because it can kill at somewhat longer distances; where cover is thick preference is given to cylindrical bores. 3. Use wad size of shell always.

**L. B., Long Branch, N. J.**—I have a pointer dog on whose left shoulder there is a lump growing. The lump has been coming for about two weeks. It first made its appearance where he had been bitten during a fight. At first the lump was filled with water and blood, which, upon being lanced, spurted out, leaving the lump nothing but an empty sac. It now appears to be filling up again, this time with a hard substance. The dog does not seem to be suffering any pain from it, nor has he any time; but, on the contrary, allows any amount of handling. Ans. There is probably a chronic abscess which should be freely opened

and washed out with a weak carbolic acid lotion. In such a case, however, it is always wise to consult some good, practical surgeon. If you are right as to its being a growth, extirpation is the only cure.

**D. C. D., Harrisburg, Pa.**—I have a young setter dog, 14 months old, who, I think, is suffering from a severe attack of distemper. His symptoms are—discharges from the eyes and nostrils; when walking, has a short cough; and, at times throws up a slimy matter. I have commenced dosing him as follows—one drop of Donovan's solution three times a day in water; also, every four hours, 8 grs. of the following powder: Powdered rhubarb, 18 grs.; white Castile soap, 6 grs.; septandrio, 6 grs.; powdered cubeb, 3 grs.; quinine, 9 grs. I would like very much to have your opinion of the treatment. Ans. Your treatment will not have done any harm. For details of treatment of distemper you should consult "Hallow's Gazetteer," or Dr. Strachan's article on distemper in the dog. The details are too various and important to be given in a short reply.

**READER, Middletown.**—1. What is the "Compensating Lump" advertised by W. & C. Scott & Son in their breech-loading guns? 2. Of what advantage are solid head strikers? 3. In my Scott gun there are two mortises cut through the breech frame. In others that I have seen there is but one, allowing but one ing to pass clear through. What is supposed advantage? 4. How can I remove rust from breech end of my barrels where they come against the frame? 5. Please give me the address of New York agency of Volley guns? 6. How long would it be before I could get a gun—English—if made to order? Ans. 1. The compensating lump by adjustment takes up the wear in the joint. 2. Solid head strikers come back by their own weight to relieve the shell and disengage with spring movements. 3. Advantage we think more apparent than real. 4. Use paraffine oil; leave it on and when the rust is softened, employ a scratch brush with care. 5. Don't know. Try Fowler & Fulton, or Squires. 6. Three months fully.

**THE SAD FATE OF ALBERT ROSS.**—A FRESH "LAT" OF THE LAST MINSTREL.—Under the heading "Bird Lime" the *Burlington Hawkeye* has this:

"Been off on a lark, eh?" a woman's voice came dropping out of a second story window out on West hill, at the solemn hour of midnight. "Been out on a lark, eh?"

"Bat your life," replied a deep manly voice, about eighteen inches thick.

"All right," she said, "go roost in the cowshed."

"Won't do it," he persisted, "there's cattle linnet."

Then she told him he had been robin's family to pay the bar-keeper, and he said if she didn't hush 'owling he'd whip her well when he got in the house.

"You try it," she screamed, "an' I'll up an' hawk you down with a flat-iron."

"Gull long," he yelled, "ye couldn't do it. Let me in and let's stork it over."

And if the neighbors hadn't interfered and stopped it, there is no telling to what extremes they might have gone.

So much for the Western bard. The séquill of equal importance is on our partridgeal:

That chap, you may be sure, had been off on some bad herond. After the neighbors had gone back home his marling-ered 'cause shad-spirt, and wouldn't sparr'er red to spoil her child. "I'll compel you to behave if compel-I-can," said she. "Dodon't," he cried, "Ibiseech you don't," and then he yelled "Cormorant!" but his auntie wouldn't come over. (She being a painted gall-i-nulittle of her real but-o.) Then they avocet to worse than Turkey and thrush-ans, and after she'd bittern ear off he flew at her and hit the old-squaw's craneum a clapper-lair thunder, that ortolanded her where the woodbines curlew know.

This was nothing less than a grouse outrage, in the highest degree repre-hensible. The fellow (which his name in Pigeon English it was Albert Ross) was arrested and summarily convicted by a great American (!) Eagle a-tern-y, who had carefully condor the game laws. The sentence, couched in language somewhat stilted and high-flown, but comparatively Pollyshed, was, that the prisoner, an old jay-l-bird by the way, should be caged in a wing of the bilding, where he woodpecker-way, ma(u)llard roc and turn-stones without any sea-ducktive hopes of even taking a peacockasionally through the windowitcher cruel architect had made only one-halfinch wide.

Andove his end, if we may swallow the story of the Ancient Mariner with the ori-older pate, who, we must honestly confess, is sometimes too greater-telltale to be believed,

"Albatross  
was hung,"

or, in other words, was ex-cooted.

It was a Rembrandt-ian scene. As Virgil says,

Now incubat ponto—

"Night brooded o'er the deep." Not a starlingered in the sky. The carrion vultures, unbappy birds, perched upon the gibbet to carryon an auk-tion for the choice tid-bits of his body. These were bidden off for a mere song. Then they pulled wishbones for the first peck at his eyes. This was won by a *biase* old epicure, who from his gambling proclivities and the fact that he was never without those useful instruments of his profession, was known among his cronies as the "Bird of Pair o' dice." Meanwhile the corpse, flapping in the night and gale, was cutting up all sorts of Jim Crow pranks, at which audacious Tom-tittered, while Cardinal Grosbeak woodcock his eye and sora-fully eggsclaim, "Let osprey!"

But we willet up and pullet short, n-orstretch it farther, though we might

Capon doing it,

as the popular song has it.

[\*This was not addressed to the birds of prey mentioned above.]

—We call the attention of our "crack shots" to the advertisement of the FOREST AND STREAM AND ROD AND GUN in another column. As the prospectus says, it is "a journal devoted to field sports, and the inculcation in men and women of a healthy interest in out-door recreation." The object in view is certainly a good one. All sportsmen should take the paper.—Red Oak (Tampa) Record.

A WEEKLY JOURNAL,  
DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY,  
FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS,  
AND THE INDOOR RECREATION OF MEN AND WOMEN OF A HEALTHY INTEREST  
IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY  
**Forest and Stream Publishing Company.**

No. 111 (old No. 103) FULTON STREET, NEW YORK.  
[POST OFFICE BOX 2832.]

TERMS, FOUR DOLLARS A YEAR, STRICTLY IN ADVANCE.  
Twenty-five per cent. off for Clubs of Three or more.

#### Advertising Rates.

Inside pages, nonpareil type, 25 cents per line; outside page, 40 cents.  
Special rates for three, six and twelve months. Notices in editorial  
columns, 50 cents per line.

Advertisements should be sent in by Saturday of each week, if possible.

All transient advertisements must be accompanied with the money  
or they will not be inserted.

No advertisement or business notice of an immoral character will be  
received on any terms.

\* Any publisher inserting our prospectus as above one time, with  
brief editorial notice calling attention thereto, and sending marked copy  
to us, will receive the FOREST AND STREAM for one year.

NEW YORK, THURSDAY, DECEMBER 6, 1877.

### To Correspondents.

All communications whatever, intended for publication, must be accompanied with real name of the writer as a guaranty of good faith, and be addressed to the FOREST AND STREAM PUBLISHING COMPANY. Names will not be published if objection be made. No anonymous contributions will be regarded.

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions.

Nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for dereliction of the mail service if money remitted to us is lost. NO PERSON WHATSOEVER is authorized to collect money for us unless he can show authentic credentials from one of the undersigned. We have no Philadelphia agent.

Trade supplied by American News Company.

CHARLES HALLOCK, Editor.

T. C. BANKS, Business Manager. S. H. TURRILL, Chicago, Western Manager.

NO MORE YELLOW FEVER IN FLORIDA.—Jacksonville, Fla., Dec. 1.—Thermometer 29 degrees. Ice two mornings. Disease ended. Health proclaimed over the land. AL FRESCO.

BLOOMING GROVE PARK ASSOCIATION RECEPTION.—A reception and ball will be given by the Blooming Grove Park Association to the founder and former President, Mr. Fayette S. Giles, at the Hoffman House, New York, Tuesday evening, Jan. 8, 1878. The Floor Committee are: Dr. E. Bradley, Dudley Field, John Avery, Geo. H. Glenney, Hamilton Busbey, Joseph Doré, Geo. A. Reed and J. W. B. Hughes. Reception Committee: John Avery, Dudley Field, Ed. Bradley, Geo. H. Glenney, Sanders D. Bruce, Hamilton Busbey, Chas. Hallock, E. A. Buck, Joseph Doré, A. H. Wellington, E. R. Wilbur, T. W. B. Hughes, C. H. Read, Simon Sterne, P. M. Wilson, M. B. Browne, Geo. S. Greene. Tickets can be obtained of the following gentlemen: Dr. E. Bradley, Hoffman House; Dr. Geo. H. Glenney, 45 W. 31st; Chas. Hallock, 237 Gates Ave., Brooklyn, and of members.

AUCTION SALE OF ANGLING AND SPORTING WORKS.—The Messrs. Leavitt will sell on Wednesday and Thursday evening, Dec. 5th and 6th, at Clinton Hall, a remarkable collection of angling and sporting works. Not only are all the modern writers on fishing topics to be found, but there are rare copies of the oldest writers. Among them we may mention Blome on Hawking, Fowling, Fishing, of 1686; Opplian's Catalogue of Fishes (very scarce), 1723; a superb Scrope, with lovely prints, 1843; and, most notable of all, a Belloni, *De Aquatilibus*, of 1553. This rare old copy formerly belonged to William Penn, and bears his autograph, with notes of an early date. The whole field of natural history and of sporting is represented at this sale, and amateurs should not miss the opportunity.

—Messrs. Tiffany & Co., who always produce everything with the most exquisite taste, have just issued a pretty little brochure, which is suggestive of "What shall we buy for Christmas and New Year's?" In this dainty book may be found the whole catalogue of the many beautiful things exposed for sale, by Messrs. Tiffany & Co., at their extensive establishment on Union Square. Will you purchase a gorgeous diamond, the rival of the Koh-i-noor? Tiffany & Co. will sell it you. Do you want a simple napkin ring? at Tiffany's you will find it. Somewhat curiously inclined (from the pages of their pretty book) we make this alphabetical index: You can buy, Amethysts, Bon-bon boxes, Candlesticks, Diamonds,

Emeralds, Fans, Gems, Hymals, Ivory combs, Jet ornaments, Knives, Liquor flasks, Marine glasses, Nail boxes, Onyx jewelry, Pearls, Q'riosities, Rabies, Silver sugar bowls, Teapots, Urns, Vinaigrettes, Watches, X'tra fine plated sets, Yacht prizes, with Zeal on the part of the most attentive employees in the country, who are desirous of pleasing all tastes and purses.

### GERMAN SPORTING LITERATURE.

WE beg to announce to our readers, especially our numerous German friends, that Mr. Fr. von Ivernois, so well and favorably known to them as the editor of the German sporting paper, the *Waidmann*, has purchased the controlling interest in the *Deutschen Jagdzeitung*, and has assumed its editorship.

The first two numbers of the *Deutschen Jagdzeitung*, an illustrated journal devoted to the sports of the flood and field, are now before us. Our confrere, who is not only a sportsman of rare merit, combines with the soundest practical knowledge a positive amount of scientific acquirements, which enables him to discuss, *a fond*, questions of Natural History. The illustrations in the *Jagdzeitung* have that peculiar excellence, with faithfulness as to details, which only German artists can execute.

We believe that among our German citizens throughout the United States Mr. Von Ivernois' *Deutsche Jagdzeitung* will have a wide circulation. In its well written pages will be found many admirable records of hunting; and it must be pleasant for its readers to compare thus intelligibly the hunting events of their Fatherland with similar scenes in the country of their adoption.

To Herr Von Ivernois we are ourselves indebted, not only for a great deal of sound information, but for many acts of courtesy. The *Jagdzeitung* is published in Eilenburg, Prussia.

### REMINISCENCES OF THE CINCINNATI ANGLER'S CLUB.

PLEASANT is it to recall the history of a famous club which was formed in Cincinnati as long ago as 1820, and was called the Cincinnati Angler's Club. Eighteen hundred and twenty-nine! Then John Quincy Adams was president. Sometimes, in looking back almost half a century, it is necessary to get at some fixed historical date in order to appreciate the time long since past. Now, just fourteen years before this club originated, Waterloo had been fought and Europe was still feeling the effects of this mortal shock. Men were hale and hearty then who, as members of the Cincinnati Angler's Club, had fought with Old Hickory at New Orleans.

It was Lewis Howell, an excellent angler, a good merchant and an honest man, who was the first president. Let us look over the names of the honorary members. We find in the list, Gov. McArthur, of Ohio, Hon. James Hall, the Hon. M. Bibb, General Leslie Combs (still alive, and grandfather of Mr. Bruce, of the *Turf, Field and Farm*), and grand old Daniel Webster. Here is a letter of Mr. Webster's, preserved in the archives of the club:

BOSTON, October 3, 1831.

Dear Sir—I had the pleasure to receive your letter of the 27th of August, transmitting the official certificate of my membership in the "Cincinnati Angler's Club." I pray you, my dear sir, to present to the members my thanks for the honor of this admission among their number. If I should ever accomplish a purpose long entertained of visiting Ohio, it will give me pleasure to try the quality of their sports. Meanwhile, should any Cincinnati "brother of the rod" visit these risings of the sun, he would find glad companions for a day's exercise among the granite brooks of New England, or on the bosom of its greatest boundary. With many thanks for your personal civility and kindness, I am, dear sir, your obedient servant,

DANIEL WEBSTER.

Of course, as fishing and hospitality go hand in hand, and seeing much water produces great hunger and unquenchable thirst, a grand dinner had to be given under the auspices of the Cincinnati Angler's Club in 1830, on the occasion of its anniversary. If the great constitutional expounder had gone to that dinner undoubtedly he would have fed well, and more than one bottle of rare old Madeira would have fallen to his share. It was Mr. Benjamin Drake, an invited guest, then publisher of the *Cincinnati Chronicle*, who made the speech, and a famous discourse it was, and "Honest Old Izaak Walton" was spoken of with reverence. This association of gentlemen, held together by those pleasant bonds which always unite anglers, had, in 1837, another notable event. Fishing and feasting were in order, and the junketing took place at White Water, some twenty miles from the City of Cincinnati. Three hundred and fifty-three bass and salmon trout were captured. Certainly the dinner was a good one, for we learn that the ichthyological *piece de resistance* was a noble bass captured by the president of the club.

It is an original member of the club who sends us various cuttings from contemporaneous Cincinnati journals telling us the story of this good old club, and from these sparse data we have written. Every now and then, amid the accounts of the fishing and jollity, there appears this paragraph—alas! too often repeated: "This was said, or done, by our late lamented fellow member, whose death occurred some years ago;" and so it goes, records of life and death mingled together. As with cheerful and sad feelings we read then the story of this club, we have at least the satisfaction of knowing that, for a brief period in life, these brave old brethren of the rod had a good time of it. It is, then, with pleasure that we give the records of a good old club, whose memory, we trust, will not pass away.

A GAME DINNER.—They had a famous banquet in Chicago the other day, the savory odor whereof was sniffed as far East as the New York *World* office, and its olfactorys being agreeably tickled that journal is moved to publish the bill of fare:

The excellent Mr. John B. Drake, proprietor of the Grand Pacific Hotel at Chicago, perhaps better known before the great fire to travelers as the manager of the Tremont House, has for the past twenty-two years given an annual "game dinner," which has grown from a supper for a small party of friends up to a banquet of 500 covers, with guests present from every part of the country. The position of Chicago on the prairies and within easy reach alike of the seaboard and the great plains, gives her gastronomes exceptional advantages, since she can command at once the oysters of New Jersey and New York, the ducks of Maryland, the prairie chickens and wild turkeys of Illinois—Judge Caton has, we believe, succeeded in domesticating these birds—and the venison of the Rocky Mountains. Here is the *menu* of the last game dinner, given a few days ago, without the vegetables, salads, pastry and desert, as an illustration of the resources of this country in the way of fish and game:

| Game.                       | Oysters in shell.<br>SOUP.            | Bouillon.                    |
|-----------------------------|---------------------------------------|------------------------------|
| Baked red snapper.          | FISH.                                 | Broiled whitefish.           |
| Leg of mountain sheep.      | BOILED.                               | Ham of black bear.           |
| Buffalo tongue.             |                                       | Wild turkey.                 |
| Saddle of antelope.         | ROAST.                                | Loin of buffalo.             |
| Coon.                       | Woodchuck.                            | Canvas back duck.            |
| Prairie chicken.            | Wild goose.                           | Black duck.                  |
| Green-winged teal.          |                                       | Redhead duck.                |
| Black bear.                 | Blue-winged teal.                     | Spotted grouse.              |
| Blue-billed widgeon.        |                                       | Wild turkey.                 |
| Ruffed grouse.              | Opossum.                              | Leg of elk.                  |
|                             | Saddle of black-tail deer.            |                              |
| Jack snipe.                 | QUAIL.                                | Fox Squirrel.                |
| Gray squirrel.              | Reed bird.                            | Partridge.                   |
| Plover.                     | Sand snipe.                           | Red squirrel.                |
|                             | ENTREES.                              |                              |
|                             | Squirrel, saute, port wine sauce.     |                              |
| Buffalo steak, with jelly.  | Steved terrapin, en caisses.          | Veau au pie, hunter style.   |
|                             | Fricassee of rabbit, aux champignons. |                              |
| Escaloped oysters.          |                                       | Wild pigeon compote.         |
|                             | Salmi of game, with olives.           |                              |
|                             | COLD ORNAMENTAL DISHERS.              |                              |
| Wild turkey, en nid.        |                                       | Roast hare on socle.         |
| Quail in plumage.           |                                       | Prairie chicken, au naturel. |
| Boned partridge in feather. |                                       | Duck, truffe on socle.       |
| Fox squirrel.               |                                       | Blackbird in plumage.        |
| Galantine of grouse.        |                                       | Snipe in marsh.              |
|                             |                                       | Stuffed coon, au naturel.    |

SUSTAIN ESTABLISHED SPORTING PAPERS.—There are now in the United States five sporting journals which have been in existence four years and upward, and may therefore be reasonably considered as established and permanent. They are recognized as the representatives of the especial interests which they severally espouse, and as authority in all matters pertaining to them. By push and pluck and self-denial, by study, acquisition and experience, by much outlay of money, by inculcating out-door tastes and cultivating patronage, by personal intercourse and familiar correspondence with leading intelligences in all the States and Provinces, they have succeeded in securing the confidence of their constituents and the public, and placing themselves upon the firm basis which they now occupy. If there is any speciality in the field of sport, or physics, or natural history, that some one of these journals does not occupy, we are too blind to discover it. If there is any field of occupation that some one of these is not *qualified* to fill, we fail to see it. If there is one intellect so brilliant, or one mind and body so versed and habituated by travel and familiar converse with natural and physical objects, as to be able to eclipse the luminaries that now shed their light over the sporting world, it has not yet appeared. The star in the East certainly has not risen.

The field of journalism is precarious, and especially of sporting journalism, which bears the same relation to our business economy that luxuries do to necessities. The demand ceases when the want is supplied. If we estimate the number of sportsmen's clubs in the country, and the numbers of members thereof; if we calculate the numbers of those persons who merely travel for recreation, and add the very considerable class whose tastes are no more than æsthetic, we may approximately reach the extent of the constituency upon which our present established papers have to depend for support. We can prove that it is scarcely large enough to yield each paper a livelihood. A test of ten years of joint experience long since convinced the proprietors of the *Rod and Gun* and the *FOREST AND STREAM* that the field was not wide enough for them both. One representative journal of their peculiar class at the West and one at the East we felt ought to supply all wants in their direction; so they united.

But other minds more perspicacious think differently, it seems. Within a month no less than six (!) sporting journals have been started as bidders for a division of the patronage bestowed upon the old papers. We have no particular objection to their *starting*, nor to their learning the lesson which experience has taught wiser men before them. The fittest will certainly survive. But unless there is positive assurance or reason to believe that any of the new aspirants will fill the bill better than the old papers, then it is impolitic for sportsmen to take from the old to give to the new, for it makes the first poorer and the other it does not enrich. Does the public actually have more faith in the glittering promises of the new ventures than it does in the tried performances of fixed facts? If so, how many years is it willing to wait for the proof that their judgment is sound and their confidence correctly bestowed? Journals are not established in a day, and success is as rare as gold nuggets in a placer.

SOME time ago when Chief-Justice Daly, President of the American Geographical Society, called attention to the fact that the Lake Ukerowe (Victoria N'yanza), of Speke, and the Mwtan Nizi (Albert N'yanza), of Baker, were simply rediscoveries, the dictum of the accomplished American geographer was received with general incredulity. In a map, published in *Harper's Weekly*, of Nov. 17, is given an exact copy of Ptolemy's Map of the World, which was first executed some seventeen hundred years ago. In this Ptolemaic map the course of the Nile is distinctly laid down, and its source and origin traced. The feeders of the river, due to mountains, are clearly defined, and one is amazed at how really near to the truth were the topographical delineators of those early times. The two large lakes, the grand reservoirs of the Father of Rivers, are by no means out of position. Paul du Chailly, in a letter in *Harper's Weekly*, calls attention to this very interesting and truthful example of early cartography. Leaving Africa aside for the moment, to return to it later, we find the details of Europe are in some respects fairly accurate. England, however (*Albion insula*), is very much too long, pointing too far north, and having an arm of land reaching out towards the Norwegian coast. Hibernia is about three times as far from England as it should be. One curious comment in the civilization of 1,700 years ago and to-day is, that while in Northern Africa innumerable geographical names are given to mountains, rivers and towns, in England all is a blank. Eastward from Arabia matters are more confused, and there is a huge island, described as *Taprobana insula*, which is not readily distinguishable, though Malacca and Cochin China are fairly outlined. In the Western Atlantic, the Canary and other islands are indicated. Returning to Africa again, and referring to a capital map printed in the New York *Herald* of the 14th of November, where the wonderful feats of Stanley are recorded, a curious opportunity is afforded of comparing the Ptolemaic map and that of to-day, in regard to the course of the Congo or Lubala. In the *Herald* map, north of the Congo, there is a river indicated, but which has no name. In the old map of Ptolemy the Congo is made to have various affluents. Perhaps future discoveries will assimilate more to the ancient course given to the Congo. The source of the Congo on Ptolemy's map seems to be quite identical with that discovered by the intrepid Stanley.

**HOW TO CLEAN CHOKED WATER PIPES.—A NEW USE FOR EELS.**—The following experiment is so novel and so authentic that we wish to give it full prominence. It beats all other fish stories out and out:

[This most ingenious device on the part of our correspondent, we are afraid, is fraught with danger; not so much to the cell as to himself. What will the fiend of the bath room, that demon who gloats over freezes and thaws, commonly known as the plumber, do now? Certainly the man and his helper will find their occupations gone, and, reduced to poverty, or at least forced to gain their livelihood in a legitimate way, they will go for our correspondent with murderous intent. Philosophizing over the matter of clearing stoppages in water-

# WORSE THAN MORIBUND ON RIFLE MATTERS.

THE recent attack of the *Army and Navy Journal*, upon the existence of the National Rifle Association, was put squarely upon the ground of the passage of a certain resolution by the directors of that body, although in point of fact the obnoxious resolution, so far from having been passed, was tabled. The natural comment excited by this blunder, instead of eliciting an acknowledgment of stupidity from the *Army and Navy Journal*, only produced a denial of the right of the N. R. A. to use the title of the National Rifle Association of America; a still more ludicrous mistake, as every rifleman in the land knew to the contrary.

Under the spur of the moment, dimly conscious how really ignorant it was, the *Journal* has at last arisen to explain. It makes this movement by dodging the whole subject. The assertion was made by us that its information was simply incorrect. Its answer is that it is useless to baffle the issue by questions about "the exact wording of particular resolutions," coupling this disingenuous way of putting the matter with a thrust at the *FOREST AND STREAM* AND *ROD AND GUN* and the *Turf, Field and Farm* as "moribund sporting journals." Not satisfied with this, it goes back to its old position and asserts "that a contest with the British N. R. A. is worthy of the dignity of our American National Rifle Association, but when the N. R. A. enters into competitions with local clubs (allows teams from Ireland, Scotland, Canada or Australia, to shoot for the Centennial trophy) in preference to accepting honorable contests with a dignified and representative body (the N. R. A. of Great Britain), it abandons its national standing and sinks by its own act to a lower position."

Moribund though we may be in the opinion of the *Army and Navy Journal*, we still retain some glimmerings of our pristine faculties. In spite of the general decay which has fallen on us, our memory still acts sufficiently to recall a period not very remote, when the *Army and Navy Journal* expressed very different sentiments from these. This was on March 18, 1876, when under the caption of "International Match," the *Journal* asserted in so many words that the position it now occupied was "untenable and illogical." That when the N. R. A. of Great Britain declared that "any team organized by them must be a team representing the United Kingdom, and not one or more of its parts; and must be the sole team sent from these islands to compete for the championship of the world," they even assumed "an illogical position." In this article it quotes at length, and with approval, the letter of the N. R. A. to Sir Henry Halford, of March 13, 1876, including that part of it which contributes the main portion of the recent resolutions, for the passage of which it has since so severely criticised them. Also on the account of "The International contest" published in the *Army and Navy Journal*, of Sept. 16, 1876, it states that "The American Centennial trophy, etc., is to be held subject to future contests, and as the contests are to be held in the country of the team winning it, we shall next year witness a gathering of all the national teams who choose to contest for it."

We must confess ourselves unable to understand why it is, that a letter which was warmly approved, when it was written as a proper expression of the views of American rifle men, should not meet with the same approval when quoted in a resolution; and why, what was in 1876 "a gathering of national teams" for an international trophy should have since become "a scrub race among local clubs."

Surely, if the original course taken in this matter by the N. R. A. of America was approved by the *Journal*, consistency required adherence to it, if it was not possible for that paper to follow their example. The *Journal* makes another exhibition of its entire want of acquaintance with rifle topics, in objecting to the system of selecting an American team by open competition. So far the benighted rifle men of all countries have followed this plan in selecting their best shots, and compelled candidates to submit to these very "vexatious restrictions" which disturb the peace of mind of our military contemporary. We dismiss for the present any further discussions on this subject with the *Army and Navy Journal*.

The casual sergeant, who may from time to time consult the *Army and Navy Journal*, in order to discover where his regiment may be posted, has full liberty to be enlightened on rifle matters by such inane twaddle as this paper produces, which, with no possible circulation, has long been known as the type of what was ineffably dull and tiresome.

SIR HENRY HALFORD'S LETTER.—In our last issue we printed a letter of Sir Henry Halford's, taken from the *Volunteer Service Gazette*. Want of space prevented our commenting, then, on the letter as fully as we would have desired. We think the excellent captain of the English team made a mistake when he stated that the American team had been shooting as a team "since April with its staff of coaches and spotters"—upon whom the men had learned to place the utmost reliance—and in saying that to put a team together "is the work of months." Quite to the contrary, competitions for places commenced July 17, and ended on August 14. The entries included many strangers to Creedmoor, one of whom, Capt. Jackson, of Boston, was selected. Mr. Hepburn had not shot on the range for a year, and Mr. Lamb was a brand-new man. In these competitions the contestants for honorable positions shot very close, and every man for himself. There was then no coach used at all, and it was by lot that the rifle men were assigned to the

targets every day. On the 14th of August the team was regularly organized, and selected its spotters and other assistants. The first practice was on the 14th of August, and the team had precisely four practices, to wit: on August 14, 15, 21 and 22; neither more nor less before the arrival of their gallant adversaries. After that both teams shot twice a week, with occasional individual practice. As far as coaches were concerned, Mr. Hepburn, who acted in that capacity during the matches upon one target, had up to that time been shooting upon the reserve. Mr. Coleman, the other coach, has been acting as adjutant. It is *guns, guns, guns*, Sir Henry Halford, which beat you. As long as you put all your faith in the discipline of a team, and but little in the merits of the American rifle, you will be beaten, Sir Henry.

COL. PEEL'S REPORT OF THE INTERNATIONAL MATCH AT CREEDMOOR.—We copy from the *Volunteer Service Gazette* a most interesting communication from the executive officer of the English N. R. A. We consider it an exceedingly thorough analysis of the whole matter. At least there is one good authority in England who thinks that the rifles have something to do in a match. The italics are our own. Col. Peel's rules for team shooting are excellent, and rifle men both at home and abroad should be indebted to Col. Peel for the clearness with which he expresses his views:

13 PAUL MALL (East), Oct. 8, 1877.

My Lord.—In accordance with your wishes I have committed to paper, for the information of the Council of the N. R. A., a few points that have come under my notice whilst in America with the British Rifle team. In the first place I saw no novelty that I think should be adopted at Wimbledon, with the exception of the telephone, and one or two smaller matters, such as:

1. High scoring-boards (showing over the heads of the crowd).
2. Dial for wind-gauge.
3. Shelter tents.

In all relating to the order of shooting, squadding, and matters of executive detail, the Americans are behind us. They have adopted our rules almost *verbatim*, but are not obliged, perhaps, to carry them out with the exactness and punctuality, the necessity for which has been forced upon us by limited time and unlimited entries. With regard to the result of the international match itself, those of the Americans whose opinions are of most value, appear, I may say almost unanimously, to attribute their success to three causes:

1. To the superiority of their breech-loading rifles and ammunition, and to the care taken in making the most of these advantages.
  2. To some of our men adopting the "prone" position.
  3. To the better organization of the American team.
- They attach relative importance to these three causes in the order given above. I quite agree with them as to the causes, but as to their relative importance I am inclined to reverse the order, thus:
1. Organization.
  2. Position.
  3. Rifles.

In examining them I will, therefore, take them in the latter order. The superiority of the Americans, or rather our inferiority in team organization, is, I think, far greater than they have any idea of, or than anybody else has, not as it were behind the scenes of both teams like myself, can quite appreciate. It is a subject that appears to me to have been quite neglected by our shooting men, who apparently are unable to understand the importance of working in concert. To enter a team composed as ours have always been, against the Americans, is like expecting an undisciplined rabble to hold its own against a body of Regular troops of similar numerical strength. I can scarcely believe that our present race of shooting men—brought up as they have been to trust solely to their own judgment—could ever, as a rule, be induced to abandon their individuality to the extent that is necessary for the formation of a disciplined team.

The Irish and Scotch appear to have picked up in their visits to America some vague notion of what may be done by acting in concert, but to me it is surprising that, having witnessed the American method of team shooting, they should have failed to see the hopelessness of competing with the Americans under present conditions. One of the "Eights," shooting for the Elcho Shield, can no more be considered a team in the American sense, than can a number of horsemen collected haphazard be considered a cavalry regiment. If the council were anxious to introduce team shooting into our country, I should say—"Don't attempt to form teams out of present race of shooting men, but let the Chancellors' Plate be shot for with breech-loading match rifles, and send somebody down to each university to coach the men for a couple of months." This would ensure your getting men of an age and of a temperament which would allow of their being under some sort of discipline—a *sine qua non*. In a separate paper, which I append, I have made a few notes as to how a team should be chosen and put together. They are drawn up almost entirely upon the American model, with some minor changes and additions which I think would be found improvements. Undoubtedly a man in the "prone position"—i. e., on the face—as compared to the "back position," is exposed to a breakdown. That is, a man who generally makes brilliant scores, "on his face," should be suffering from indisposition or nervousness, or be "out of sorts" from any cause, goes to pieces altogether. This does not occur in the case of a man shooting "on his back," who, under similar circumstances, will probably only a drop a point or two, and not throw out his comrades. I must here explain that, in a properly organized team, a breakdown means not only (as with us) a falling off in the individual's score, but the throwing out of gear of the rest of the team. It is noticeable that the three men of our team (all celebrated shots) who fired in the "prone" position, made the three worst scores recorded in either team, while one of the highest scorers on the American side was a man who was so ill that it was a question from round to round whether he would not have to give up shooting. This is a subject upon which (in common with the Americans) I know that I differ with Sir Henry Halford and others of our party, doubtless far better judges than myself, who am unable to approach the subject scientifically. Still, where "doctors disagree," the looker-on, who proverbially "see

most of the game," may perhaps venture to give his opinion *quantum valet*. In discussing this subject we should not be misled by the high scores made at Creedmoor, which mean nothing, and are attributable solely to local circumstances. The marking, scoring, etc., which are carried on most strictly and fairly, are precisely the same as our own, and yet a man shooting individually makes, or ought to make, some ten points more than his Wimbledon average in 45 rounds at Creedmoor. The surroundings of the range are green, the butts sheltered, the climatic and atmospheric influences less variable, and there is generally, as compared with Wimbledon, scarcely any "mirage," whilst from the northern aspect of the butts the sun is never in the shooter's eye. In short, Creedmoor is a perfect shooting gallery. The Americans state that with the breech-loader they can use a heavier charge of gunpowder than can be done with the muzzle-loader. They lay great stress upon their powder burning slower than ours. They claim that by these means they obtain a lower trajectory and that in other respects their bullets are less affected by external influences. In connection with this subject I was assured by a member of the American team that visited Dollymount and Wimbledon in 1875—an exceptionally wet year—that they found it necessary to make little or no change in the elevation of their rifles, from what they used at home—not more than what one day's practice sufficed to rectify. This was certainly not the case with our rifles at Creedmoor. The heavy charge necessitates "cleaning out" after every round, but they claim that the weapon they use, being in itself a practical one, and suitable for military or sporting purposes, they may consider themselves entitled, for match purposes, to get the best shooting out of it they can. The "cleaning out" varies according to fancy, but the method most frequently adopted consists of four distinct processes:

1. A water brush and water are used.
2. A dry rag or piece of lint.
3. An oiled rag.
4. A piece of wash leather.

They load their cartridges on the ground, inserting the bullet, which has a lubricated paper wrapper, but no wad, very slightly (1-16th of an inch only) into the shell. Old shells are considered the best until they get out of shape. Some men prefer, for match purposes, those that have been used twice, others thrice; and some, I understand, use the same shell over and over again.

All this is, of course, unpractical, but they contend that it is not more so than the use of the sights employed in all match shooting, while the rifle is "the gun of the period," and fit to be taken from the ranges to the battle-field or the prairies.

I watched their shooting on many occasions very narrowly, and observed that when one man of their Team had once got well on to the bull's-eye, a change of sighting or elevation was comparatively seldom made by the others at that distance. On the other hand, each man of our party, as he came up to fire each round, would be fumbling with his sights, screwing them up and down, and apparently making abstruse mathematical calculations.

This looked, to me, like a confirmation of the American claim to a lower trajectory than ours.

I should add that they have several Melford and Rigby rifles at Creedmoor, and have tried them, in every way, against breech-loaders—more exhaustively, I fancy, than we have done.

It would be useless to enter into the question of which they consider the better of the two, but I am bound to say that the balance of the evidence appears to me to be in favor of the breech-loader when properly handled, being slightly superior to either.

It should be mentioned that, with all their cleaning out, the Americans always got through their shooting, both in practice and in the match, at every distance in something like two-thirds of the time taken by our men, who, themselves, shot much quicker than at Wimbledon. This was in a great measure, no doubt, owing to superior system and discipline, but something must also be credited to the breech-loader. As individual marksmen there is little, if anything, to choose between the representatives of the two nations. In the *Spirit of the Times* match for individual shooting—which took place on the Tuesday following the great match, and in weather more calculated to bring out individual merit—our three highest scorers were beaten, it is true, by fourteen Americans, but on the other hand, taking the members only of the two Eights of the previous week, the British made a slightly better total. This result goes to prove that the best individual shot is not, necessarily, the best man in a team, and *vice versa*; but I fail to see that, as has been claimed by some, it denotes any decided superiority in the British over the Americans, even in individual shooting. As it would be useless to point out all our faults without suggesting some remedy, I shall endeavor to deduce the lessons which, to my mind, all concerned should learn from the experience gained at Creedmoor. To the "small-bore men," I would say: "Get a good 'back position,' if you have not already adopted one; treat your rifle scientifically, and try and get the best possible shooting out of it; above all, if team shooting is to be carried on, study system and discipline, which are synonymous with organization." To the "gun-makers" I would say: "Do not stop to discuss the merits of your respective muzzle-loaders, but go with the times, and do not rest satisfied till you have produced a practical breech-loading rifle that will beat all the muzzle-loaders and breech-loaders ever yet made. To the Council of the N. R. A. I would say: "Whether you wish to encourage team-shooting or not, hold out every inducement to the production of the best breech-loading rifles; raise the maximum weight of military breech-loaders from 9lb. 4oz. to 10 lb., and let a military breech-loader be the Match rifle of the future, allowing any contrivance that science or ingenuity can invent to get the best shooting out of it for match purposes, without destroying its efficiency as a military weapon. Above all, set your face against the further use of muzzle-loaders, even if proved to be better for match purposes than our present breech-loaders. The former are relics of a bygone age, and the chief obstacle to all improvement in a practical direction. Were this policy pursued, we might look for a revival of the interest formerly taken by the public in match shooting—an interest now confined to the hundred or so who possess muzzle-loading rifles and their immediate friends, and apparently dying out among them." I am unwilling to close this paper without a word of well-merited praise to the members of our team. They did their best, and, according to our standard, they shot splendidly. They showed great pluck, too, throughout an uphill contest, and took their defeat as a defeat should be taken.

If in any of my remarks I may appear to have been hard upon them, it is only because the report of a defeat must necessarily be to a certain extent an adverse criticism. Having been asked for my opinion, I have given it honestly, and I hope not unkindly.

I have the honor to be, my Lord, your Lordship's obedient servant,

C. L. PEEL, Lieut.-Col.

Executive Officer N. R. A.

To the Earl of Wharcliffe,  
Chairman of the N. R. A.

## RIFLE TEAM ORGANIZATION.

I am decidedly of opinion that the Captain of a Team should not himself shoot. He would find ample occupation in looking after his men, whereas should he shoot, his duties at the firing point must in a great measure be left to a "Coach," who would not carry the same weight. This, however, must depend upon circumstances, and a fixed rule can hardly be laid down. The man selected to act as Captain should possess great tact and firmness, should be devoid of anything like "fussiness," and should have had so much experience that the Team generally would be ready to give cheerful obedience to all his directions. Nobody but the Captain should ever find fault with a member of the Team, or even point out an error. In my opinion there should be but one "Coach" for the whole Team, though it would of course be open to him to call in further advice. The Coach would be, I think, as stated above, better employed in filling the office of Coach than in shooting. The Coach should watch every current of air, every change of atmosphere; he should know every man's shooting and peculiarities, and should keep a register of every man's "target" on all occasions. To him alone it should be given to advise, and if necessary to order a change of sighting or elevation. There should be a spotter to each target. He should be provided with a spotting target, telescope and a differently colored pin for each man of his squad, *e. g.*, red, blue, yellow, green, etc. The spotting targets should be placed so that every man of the team can see them both. The pin corresponding with the list shooter of each squad should be stuck into the spotting target of the squad, in exactly the spot struck, and should remain there till that man fires again. Thus each man's last shot, and every hit made since he last fired would be seen at a glance. The spotting of the spotter must be accepted as the official record of each hit, and no private spotting by or for any member of the team should be allowed. A spotter should not be required to keep a score, or do anything but spot correctly, which will be found ample occupation for one man. It is usual to allow individual shots of note to compete for places in a team; but I should prefer that the choice of the men should be left solely to the Captain, whose powers should be in all respects absolute. I do not think that the best individual shot is necessarily the most valuable man for a team; far from it. To be of use in a team a man must not believe himself, or his opinion, to be infallible, as is not unfrequently the case with shooting men. He must not only be willing to act contrary to his own opinion at times, but he must be capable of knowing when a bad shot is the result of a "bad let off," or other accidental circumstance, and be prepared to say so honestly. Many shooting men think it impossible that they themselves can make a mistake, and imagine that a miss or bad shot must result from some cause over which they have no control. Such men are unfitted for a team, however brilliant their individual shooting may be. Knowing how our present small-bore men have been trained solely for individual shooting, I should prefer to pick a team from untried men, or men who had little or no practice as small-bore shots. The stamp of a man I should select would be one having a clear, light eye, a steady hand, a good digestion, and not knowing the meaning of the word "nervousness." He should be able to devote at least six weeks to practice, be willing to submit to discipline, and to a certain extent be prepared to "go into training;" enough of the latter to keep him in good general health. As it is absolutely necessary that a team should practice together for weeks, all the members must live within easy reach of each other, and of a long-range butt, and be able to give up, say, six hours for three days in each week to practice. The Universities appear to me to be the only localities in this country which at present combine the necessary advantages of a large choice of young men amenable to discipline, with the opportunities for constant practice. Small-bore clubs with permanent ranges might be got up near our large towns if match shooting were to be generally taken up; or if it were to be encouraged in the army, no doubt many first-class teams might be got up at Hythe, Aldershot, or elsewhere. Whatever rifles may be used, the first thing to be done after picking the ten men to compose your team, is to bring all the rifles together in the matter of sighting, so that they shall all have a common zero for elevation and wind, and that the minutes or degrees shall be precisely similar. Their accuracy in these respects should be ascertained on a calm day at 200 yards, and again at 800 yards, to insure the sights being upright, and they should be frequently re-tested during practice. In a word, every rifle should be so exactly the counterpart of the rest that every man might be supposed to be shooting practically the same gun. This is the foundation of the system of team-shooting. The eight men to compose the team should be selected from the ten, as early as possible, by the Captain, and the two reserve men should be prepared to work as though they were chosen in the eight. I assume that no man would be chosen who was not a reliable "holder"—a mere question of eye, nerve and "position."

Three targets should be appropriated to the practice of the team. The team proper should shoot at the two outside ones, the captain squadding them by fours to a target. The two reserve men should shoot at the centre target, each working with one or other of the squads, in such a way as to be able at any time to take the place of any man who may become non-effective—*i. e.*, each reserve man should shoot every day as the duplicate of one of his squad, firing at the same time and getting his coaching precisely as though he were that man. One day as No. 1, next as No. 2, and so on; but he must not disturb the squad, and must fire at the centre target, although his hits must be spotted on the spotting target of his squad. The captain should, either on his own judgment or after consultation, decide, before commencing at each distance, with what elevation and wind allowance the experimental shot is to be fired. This done, the steadiest man in the team, who should always lead one of the squads, should fire the first shot. Should this produce a good bull's-eye, the proper sighting has been found, but should it not be a good shot an alteration must be made by the captain in the sighting before the second man fires, and so on till a good bull's-eye is made. This experimental shooting should only go on at one target, but the proper sighting once arrived at, both squads should take up the shooting without delay. It is evident that, theoretically, one man having made a good bull's-eye, and every man being a steady puller, and the rifles precisely similar, as long as the wind and other external influences remain unchanged, every man should get a bull's-eye at each shot. Therefore, the elevation and wind once correctly obtained, the quicker the shooting and the more shots that can be got on to the target before a change comes the better. To prevent delay, as soon as each man goes down to shoot, his "next man" should kneel close behind and coach him; stop his shooting during a puff of wind; tell him when to pull; shade his sights; and help him in every way. If an unmistakable change of wind occurs, of course the shooting must be stopped, and a fresh arrangement of sights decided upon,

but as a rule it should go on (and the quicker the better) till somebody makes, say, a bad inner, or something worse. It will be the special duty of the "next man" to see that the shooter's sights are rightly set and are upright, etc. This done, he will call out the letter or number of the target (say Letter H), and the shooter will make sure that he is aiming at the proper target, and repeat "Letter H" in a loud tone. Immediately after shooting the shooter will jump up, go to the left about, move to the rear of the squad without waiting for the marking, and commence cleaning out, so that there may be no delay. As his successor goes down, his "next man" will, of course, kneel by his head, and so on. If he had a "bad let off," the shooter must declare it at once, without waiting for his shot to be marked, and whether the hit be a good or a bad one, the shot must be disregarded. NO TALKING SHOULD BE ALLOWED, AND NO PRISON PERMITTED WITHIN THE ROPES WHOSE PRESENCE CAN POSSIBLY BE DISPENSED WITH. No reporters, no private spotters, no attendants carrying rifles, none of the crowd of loungers we are accustomed to see at the firing points when a small-bore competition is in progress. No body of men can work together satisfactorily without order, silence and method, which are far more necessary in team shooting than in ordinary competitions. All this simply means discipline, and if I wrote for another hour I could say no more than that word conveys. The foregoing notes were made by me when in America with the British Rifle Team, and were the result of a careful study of the American system, in which I have made such slight changes as appeared to me to be judicious.

C. L. PEET,  
Lieut.-Col., Executive Officer, N. R. A.

## A NEW RIFLE BY HAWK-INS.

POTTSVILLE, PA., Nov. 20, 1877.

## EDITOR FOREST AND STREAM:

In your very valuable journal of Oct. 25, I noticed an article—"How to Catch Hawks." Its authenticity and the theory seems to me to be indisputable, and is likely to work in nice cases out of ten; but the hero of my story did not choose to accept a "conspicuous position from which to swoop down on his victims." A neighboring suburban family of this city is in the habit of stocking a choice variety of game chickens, and, frequently, a large chicken-hawk had been noticed sailing over the yard, high up in the air, and had been watched by a sharp-shooter, from a secreted position, with a hope of his descending to have a shot at him before pouncing on his victim. The watch was abandoned. The very next day the wife heard an unusual noise proceeding from the chickens in the large yard in the rear of the house, and upon going out discovered a hawk perched upon a rooster weighing about six pounds, and trying to carry the obdicer into the air. The woman ran toward the scene of onslaught with the intention of frightening off the hawk, but the latter showed no inclination to leave just then, but still persisted in holding on to the rooster with its iron like talons, and fluttering at a terrible rate. The lady (not at all apprehensive of danger) seized his hawkship by the neck and strangled him. The hawk showed battle, and lacerated her hands with his claws in a frightful manner, but she clung on to the neck of the bird until life was extinct. The hawk measured five feet six inches from tip to tip of the wings, and weighed five pounds and three quarters.

DOM PEDRO.

THE NEW "SCOTT" REPEATING RIFLE.—Messrs. Turner & Ross, of Boston, have just perfected an arm for which hunters and frontiersmen have long experienced a want, viz.: An accurate, substantial and long-range repeating rifle at a reasonable price. This rifle is carefully and substantially made of the very best material, showing the finest workmanship and mechanism, and has not only a very rapid action, but a wonderful penetration at an extremely long range. Messrs. T. & R. are to be congratulated upon their ability to sell such a rifle at the price (\$15). It will command an immediate and extended sale. One of our best known riflemen said that it was a better gun for general use than one he had paid \$75 for.—*Adv.*

## Game Bag and Gun.

## GAME NOW IN SEASON.

Moose, *Alces malchica*.  
Caribou, *Tarandus campestris*.  
Sik or wapiti, *Cervus canadensis*.  
Red or Virginia deer, *Cervus virginianus*.  
Squirrels, red, black and gray.  
Hares, brown and gray.  
Wild turkey, *Meleagris gallopavo*.  
Pinnated grouse or prairie chicken  
*Cyrtonyx cydoides*.  
Ruffed grouse or pheasant, *Bonasa umbellus*.  
Quail or partridge, *Ortyx virginianus*.  
Woodcock, *Philohela minor*.

"Bay birds" generally, including various species of plover, sand piper, snipe, curlew, oyster-catcher, surf birds, phalaropes, avocets etc., coming under the group *Limacolor*, or Shore Birds.

MASSACHUSETTS—New Bedford, Nov. 28.—At about this season the amateur sportsman and dog may be seen in every direction around our suburbs, and the result is that large numbers of quail, partridges and rabbits are hanging at the doors of markets and groceries. Woodcock all gone; sea fowl plenty.

North Cohasset, Nov. 30.—Gunning poor this week—too much rain. Some geese have been shot flying over, but won't come in. Whistlers just arriving; bags of three and four to a man have been shot. Partridges plenty, but wild-going into trees when started, and almost impossible to start quail twice the same day.

S. K., Jr.

RHODE ISLAND—Newport, Nov. 30.—Fine weather, no birds, no shooting, except a weary sportsman now and then makes a bag of two or three gray and white gulls; the small game birds all gone.

PENNSYLVANIA.—The Philadelphia *North American* of Monday says: Our exchanges from the central and western part of the State furnish a striking evidence of the folly of those who journey to Colorado and Minnesota for hunting, and a flat contradiction to all who suppose that abundant pig-iron, coal, factories and railways are incompatible with the joys of Gordon Cumming. The *Lock Haven Democrat* of the 23d, summarizing the success of sporting parties in nine towns within a short space of time, shows that the expeditions of one or more individuals killed one otter, two mink, four raccoons, fourteen bears, and fifty-seven deer. That is, perhaps, as good a bag as was made in the same period by as many individuals anywhere east of the Mississippi, and its edges were ornamented by partridges, squirrel, and other small game, which is as welcome to the purchaser as to the hunter.

Greenville, Nov. 25.—J. F. Nelson and M. Hargen Brooks, of this place, bagged a fine bag of quail and grouse at Orangeville, O., one day last week. The Shenango and Allegheny Valley Railroad, of which Mr. J. T. Blair is Supt., runs from this place to the oil regions. There is some fine bird and rabbit shooting along the line of the road. A party came from there last Saturday with fine bags of game.

M. H. B.

Petroleum Centre.—Ruffed grouse are far more plentiful than usual, and lie fairly to the dog, and a fair shot can get 8 to 10 a day: woodcock have all left; gray rabbits are very numerous; no quail, foxes *quantum suff*; an occasional deer or two, and pigeons by the million.

Blue Rock.

Drum's, Nov. 27.—On the 27th of November Samuel Hulb and George Hunter killed six ruffed grouse and four rabbits, I and Jacob Richards killed seven ruffed grouse and two rabbits. On the 21st I killed four pigeons out of six, out of a trap.

P.

Greenville, Nov. 30.—J. T. Nelson, H. E. Camp and W. Gouchee shot twelve pheasants, ten quail and five rabbits on Tuesday last, a short distance from this place.

M. H. B.

New Jersey.—Kinsey's Ashley House, Barnegat Inlet, Nov. 28.—Continual storms past week, very high tides and not much shooting, but plenty of fowl. Brant still continue to come on, and as soon as tides fall, that we may find places to hide in, expect some big bags.

B.

SOUTH CAROLINA.—Charleston, Nov. 30. There was some good shooting among the birds; several of our good shots brought in full bags of partridges and ducks. Two parties were out after deer, and both brought in a fine buck each. Wild turkey are very plentiful, and a friend told me that in a very few days he had brought in eleven, and had missed several shots. While out last week after deer the same party started a flock of over thirty full grown birds.

YENOTS.

GEORGIA.—Myrtle Grove, Bryan Co.—Our prospects for shooting are splendid this winter. I found five coveys of partridges yesterday in a twelve-acre field. Eleven rattlesnakes were killed about here last week. They are a drawback to shooting. There are lots of turkeys and deer in the woods.

FLORIDA.—Headwaters of St. Lucie River, Nov. 14.—Duck of various kinds are beginning to arrive in this section by millions, and in a short time the prairies between here and the headwaters of the St. Johns will be alive with them. I think this section of Florida would be well worthy of a visit by northern sportsmen this winter, as game of all kinds is much more plentiful than anywhere else in Florida that I have been. Deer, turkey and smaller game, such as partridges, snipe, etc., plentiful, with occasionally a bear or panther. Mr. Maxfield Brannon, living near here, two weeks ago killed a very large male panther.

A party of some twenty-five or thirty Seminole Indians passed through here about six weeks ago; they are now hunting near the headwaters of the San Sebastian River. I did not see them, but I learn from those who did that they report the existence of an immense snake in the swamps around Lake Okuchobu, which from their description must be a species of boa-constrictor. They said they would return this way in three months; when they do, I will learn from them the truth of the report, and write you particulars.

W. C. R.

ARKANSAS.—South Bend, Nov. 27.—Game is plentiful. Deer, turkey, bear and ducks are coming in in great numbers. Squirrels are more plenty than for some time back.

G. W. S. C.

MICHIGAN.—Detroit, Dec. 1.—E. H. Gillman has recovered his Chesapeake Bay duck dog, Pride of Chesapeake, which was stolen some time ago. A friend of mine returned from Frankfort, Mich., this morning. He says deer and bear are very plenty. Three brothers, named Broderick, returned to Frankfort, Nov. 27th, from a nine days' deer hunt, with twenty-seven. W. C. Colburn and F. J. Standish, of this city, have been up to St. Clair Flats for a few days sport. They had very fine sport, getting 300 ducks (100 canvas backs, 150 red-heads, 35 blue-bills, 5 pin-tails and 10 butter-balls), 5 wild geese, 2 swans, 25 quails and a wild turkey that weighed 18½ pounds. This bag is about the finest made in the vicinity during the season. This cannot be wondered at much as Mr. Colburn is an excellent shot, and is one of our most thorough and gentlemanly sportsmen.

RED RUFUS.

WISCONSIN.—La Crosse, Nov. 27.—Ducks have remained with us longer this fall than was ever known before. Parties go up to the Lake (an expansion of Black River) on the Miss. Bottom and come home laden with mallard, and they are too fat, if such a thing can be. Woodcock have been very scarce this fall, have not seen one. Chickens were plenty in season, hundreds of them can be seen in the corn fields adjoining the village, and are being trapped by the farmer boys and pot-hunters.

I. S. F.

KANSAS.—Atchison, Nov. 27.—The shooting this fall on quail is the best we have had for years; the country is alive with them. Duck and grouse shooting has been very poor; they appear to have missed us in their flight.

H. R. B.

—We have been surprised that before this our English friends have not been using glass balls for practice. We think it worth while to mention that an order has just been received by Captain Bogardus from England for 10,000 balls and 24 traps.

CAPTAIN BOGARDUS.—As may be seen in our advertising columns, Captain Bogardus proposes breaking 5,000 glass balls in 500 minutes, which is 100 balls every ten minutes, besides the misses. This event will take place at Gilmore's Garden on the 3d of January, commencing at 3 o'clock in the afternoon. In Philadelphia Captain Bogardus, at an exhibition given by him at Kiralfy's theatre, broke 300 glass balls in 2½ minutes, and with a pistol, springing his own trap, broke 17 out of 28 balls. Doubtless this wonderful trial of skill and endurance will draw a numerous attendance. Captain Bogardus will shoot at the Olympic Theatre next week, commencing on the 10th.

AN AVERAGE PUZZLE FOR MATHEMATICAL SPORTSMEN.—A boy who had been upon a shooting excursion found upon his return that he had expended exactly one hundred shells, and that his game amounted to exactly one hundred head. His bag consisted of black birds, squirrels and woodcock. In killing the first he had, with each shell, secured sixteen birds. Each squirrel had cost him one shell, and each wood-

cock ten. How many of each kind of game had he killed to thus bring the average to one shell to each head?

## OCCASIONAL.

[We have the answer to this problem. It is so instructive that the successful student will feel sufficiently rewarded with out expecting any prize.—Ed. F. & S.]

**NOT MUCH OF A SLAUGHTER AFTER ALL.**—Although he may not want to do it, your correspondent S, Nov. 22d, page 314, needs information relative to the "side hunt" by members of the Worcester Sportsmens Club. A score or more of gentlemen hold a meeting during the open season, unite upon a day when they will go shooting, agree that ruffed grouse (known in Boston and throughout this State as partridge) shall score 25 points, woodcock 20, snipe 20, quail 20, weasel 25, squirrel 15, hare 10; sides are chosen, fifteen men on each, thirty in all. The day arrives—one of autumn's best—the shooters go forth to duty; the evening's full count is 63 partridges, 17 hares, 8 woodcock, 6 quails, 3 squirrels, 1 snipe, 1 weasel—averaging, per man, 2 1-10 partridges, 17-30 hare, 4-15 woodcock, 1-15 quail, 1-10 squirrel, 1-30 each snipe and weasel, a total of 1145 points for one side, 970 to the other. What slaughter! what slaughter!! even if all had been killed in Massachusetts, which they were not. The game was dressed, nicely cooked and eaten, long before it got "high" or any of its partakers. To me, Mr. Editor, this seems altogether a case of more fuss than feathers. K.

Worcester, Mass., Nov. 26, 1877.

**THREE BLACK CROWS OUTGENERAL THE AMERICAN EAGLE.**—Our Barneget correspondent sends us the following interesting report (handed to him by Mr. Frank Green, of the Signal Service) of an encounter between an American eagle and three crows at Barneget Inlet:

At 12:30 p. m., Nov. 28, 1877, I watched, through a powerful telescope, a large eagle on the beach eating a fish. Around him, hopping demurely, were three crows, who would pick up small pieces of the fish. The eagle seemed not to notice them much; but finally, wearied of their attentions, he seized his fish in his talons and flew off some 100 yards. The crows immediately rejoined him, and two of them took position close together some four feet in front of him. The third crow, a small, "devil-may-care" fellow, went to the rear, reached cautiously forward and plucked his tail. The eagle, surprised, jumped and turned sharply to the rear, when one of the two in front dashed boldly forward, seized the fish and flew off in triumph, followed by his companions. The eagle, after looking around foolishly for a few moments, flew off to forage for another fish.

**A SHARP GAME BIRD.**—Mr. George C. Harding writes to the Indianapolis Herald what he knows about the mallard. We vaguely surmise that none of those birds graced the game bag when the writer returned from his last hunt:

Among the millions of ducks in this region (Illinois) are found many varieties—the mallard, the pin-tail, the bluebill, the spoonbill, the teal, the canvas-back, the red head, with occasionally the great black duck—but the mallard predominates. Much shooting had made all of them exceeding sharp, and even the little butter-ball, which in our own waters is comparatively tame and the moon. As the result of much study and experience in the game birds of America, it is my deliberate opinion that the mallard is the sharpest and most vigilant of all. Talk about the eagle's eye! Its gaze is a mere blink to the scrutiny with which a circling mallard reconnoiters the topography of the country before alighting. Around and around he goes, at an elevation carefully calculated to keep him out of range of the best English breech-loader, his long neck turned here and there and everywhere, and his piercing eyes noting everything. If a bunch of willows has been misplaced—if a suspicious lump of humped-up brown is discovered among the reeds—he don't alight. What a less observing bird would take for a harmless domestic animal, or a stump, or a log, he immediately recognizes as a man. He is a civil engineer, is your mallard, and can calculate distances to a nicety. It is only by an occasional indiscretion, or a bit of dare-deviltry, that he comes within range of the hunter's gun, except at his feeding places. The mallard is a great gormandizer, and at the inexorable demand of his stomach he takes risks which with a full stomach he would consider suicidal. But even then he is prudent. His feeding places are usually impassable marshes, where even the high rubber boots of the hunter are no protection.

**A GREAT SHOOTING COUNTRY.**—The London World tells of a *batue* in Bohemia. It says: "Bohemia, after all, is a country to live in. In less than eight days a shooting party on Prince von Schwarzenberg's estate have brought down 4,000 hares, 100 roebuck, 850 deer of other kind, 48 boars, 250 pheasants and 1,600 partridges. Only fancy, four dozen boars! What terrible pig-sticking!"

## SPORT IN CLINTON COUNTY, PENN.

OUR party consisted of Messrs. Adam Carothers, of Linden, Pa.; W. McVicker, Ray Smith and John Bub, of Williamsport; Mr. Sullivan, of Philadelphia, and myself. We met at the hospitable mansion of Mr. Carothers on Oct. 20, where we were greeted with the news that bears had come down from the mountains the night previous, and that two had been seen about a quarter of a mile from the house, causing quite an excitement among the few residents of that part of the country. We at once shouldered our Winchester and sallied forth in quest of bears, which were presently discovered regaling themselves up a tree, unconcernedly munching the tender nut. Their festive entertainment was, however, suddenly interrupted and ended, and amidst a general babel of dogs, shots, halloos and growls, we brought our game safe and dead to *terra firma*. Inspection proved them to be two cubs, weighing from seventy-five to eighty pounds each, and in prime condition. The mother, as subsequently ascertained, was killed the day previous, about five miles from Linden, on the P. and E. R. R. The skin of the larger cub I brought on to be tanned. This little episode increased our desire for additional adventure.

Bright and early Monday we started for the mountains, taking a wagon and plenty of provender. We arrived at our destination about 1 p. m., having ridden a distance of thirty-five miles over pretty rough roads, about 8,000 feet above the level of the Susquehanna in the counties of Lycoming and Clinton. We found the country very thinly settled; the next house beyond ours was fourteen miles distant. The people were very kind and obliging; gave us all the best points about stands, etc., known to themselves, and, I must say, we had a delightful time. We remained ten days; the first part we had very bad luck, all the deer seeming to run to the splash dam about seven miles away, and were there killed and cut up before we arrived. This being my

first trip after deer I was fearful of getting the "buck fever," but to my credit be it said I did not experience the least nervousness, when a large doe was chased opposite to me by a fine dog owned by Mr. Carothers. I checked her with a blast and took deliberate aim, sending a ball completely through her heart—a splendid shot the old hands said. My friends congratulated me by seizing my hands and feet and bringing the seat of my trousers in sudden contact with a large pine tree. This I was informed was the custom practiced on the party killing his first deer. We killed six deer, which with the two bears made quite a fine show. Let me advise any one going on a similar hunt to take a pair of "shoe packs" instead of boots or shoes, as I found them to be the only things fit to wear on such tramps. They give plenty of room for the feet to move in, being flat with wide soles. No blisters or chafing I will always use them except for swamps. T. E. HARRISON.

—Glass ball shooting is fast gaining ground in England. We have just been shown an order from Messrs. Williams & Powell, of Liverpool, for thirty Huber's traps and several thousand of Paine's patent feather-filled balls. This is the second large order sent by this party to Mr. Ira A. Paine.

**PIN-FIRE GUNS.**—We publish an interesting defence of pin-fire guns. We must, however, give it to be our opinion that for pin-fire guns centre-fires have been properly substituted. The trouble about pin-fire guns and cartridges, our correspondent seems perfectly aware of. A pin-fire gun is more complicated, and there is greater chance for escape of gas. The cartridges are harder to load, take up more room in packing, are more readily exploded, and public opinion among sportsmen for these reasons is against them. We may be said to be fairly familiar with pin-fire guns, having used one in France as early as 1850, an excellent pin-fire gun of Le Fauchoux's make. It was an admirable arm, and good for the time, but we have done better since with later inventions. As to the second portion of our able correspondent's letter, we beg to remark that omissions of the names of States, in hunting reports, are accidental:

BATON ROUGE, La., Nov. 21, 1877.

## EDITOR FOREST AND STREAM:

Sir—In your interesting paper there has lately appeared several derogatory remarks on pin-fire shot-guns. As the question of the comparative merits of sporting guns is one which is interesting to all sportsmen I wish to write a few lines about the subject. To commence with—not from any egotism, but to show that I know something about what I'm writing—I will say that I have used pin-fire guns when breech-loading shot-guns were first introduced to any extent in this country, eleven years ago, and that I have used many guns, English, French, American and Belgian, not only breech-loaders but muzzle-loaders. I claim for the pin-fire positive action breech-loader:

1. A simplicity in its make and a durability not found in the ordinary fashionable centre-fire gun. The pin-fire positive action gun has no more springs than the muzzle-loader that is, its only springs are those in its locks, while the "modern" centre-fire gun, snap-action, has springs for its firing pins (generally) and springs to lock the barrels. Any mechanic will tell you that springs are an element of weakness in a piece of machinery. Break or disable your locking spring and where is your fashionable gun?
2. The pin-fire gun requires no additional machinery to extract the shell, as in centre-fire guns. They are pulled out by the hand. If, as often has happened [start not, young sportsmen, with your new patented snap-action, rebounding locks, pistol-grip and other humberg new-invention, fashionable gun. Such things do happen, though you may be too new in shooting to have seen them], the extractor slips by the head of the shell a great deal of trouble ensues which is not found in the pin-fire gun. The additional machinery is a sign of weakness in the centre-fire.

3. You can always tell at a glance whether the pin-fire is loaded or not, which you can't do without opening the barrels in most centre-fires. This is a great advantage. Every season numerous accidents happen from people not knowing whether their guns are loaded or not.
4. In the pin-fire gun the hammers stand up above the barrel, like in a muzzle-loader, instead of being low down and below the barrels as in most centre-fires, thus giving a better and quicker aim to the sportsmen as they guide the eye in taking aim.

It has been objected against the pin-fire that—

1. The cartridges are hard, or rather soon will be hard to get.
2. That gas escapes sometimes by the pin.
3. That they (the cartridges) are harder to pack and to carry than the centre-fire.
4. That the pin-fire is old fashioned.

I will refute these objections.

1. The French use nearly universally the pin-fire. And France is the country where the breech-loading shot-gun, in its modern form, was first adopted. Over ninety-five per cent. of French guns are pin-fire. As long as there is a sportsman left in France, or there is a game-bird left there to shoot, pin-fire guns and cartridges will be used. And this holds good also of Spain, Portugal and the Latin nations of Europe generally. I do not, Mr. Editor, speak from hearsay, but from having been in those countries and seen guns used there. I am also credibly informed that the majority of guns used in Germany and the North of Europe are also pin-fire. The French use pin-fire not only for their shot-guns but for their rifles and revolvers. It has been my fortune to have owned many revolving pistols, and the best I ever shot or saw for accuracy, surpassing our famous Colt, our improved Smith & Wesson, and the English Trauber & Adams, was a French metallic pin-fire revolver. It is said pin-fire cartridges are harder to reload. I will grant this in what metallic cartridges are used. But in what relates to shot-guns I refer to paper cartridges as I have found them, even when but once used, much more satisfactory (if a little dearer) than metal ones.

2. The old muzzle-loader most of us veterans believe to be fully as good a gun, as far as shooting goes (and some of us even think a harder shooter), than the breech-loader. Yet there was much more escape of gas at the nipples than there is with a pin-fire cartridge. The advantage of a breech-loader is in safety and general handiness, not in its shooting powers.

3. I have never found any difficulty in this respect. By placing them alternately heads up and heads down they can be as closely packed as the centre-fire. And I know they are as safe, from years' experience with both.

4. "They are old fashioned." Ah, Mr. Editor, in this matter, as in many more important, this is the great, the most damnable charge that can be brought in this present age of (pretended) progress and improvement. The people of to-day look for nothing but new fangled things, forgetting that change is not necessarily improvement. In their mad career after what is new they have abandoned the fine sense of honor, the integrity, the *gentilhomme* of their fathers. And it is mostly the people of this country that are to blame in this matter. But let me remind them that even their boasted "Great Republic" is only an experiment, that has been tried before and will probably be buried in the ashes of the past; when "old fashioned," but true, substantial govern-

ments will be in existence when the "Best government the sun ever shone on" will be dead and gone. But I'm afraid I'm getting into the province of politics in which "our paper" has nothing to do. So I'll stick to the guns. It would be folly to suppose that pin-fire guns will ever be adopted in this country. The rage for new fangled things has swept them away. But I cannot see a good thing—if it is old—abused without raising my feeble voice in its defence.

To refer to something else. In No. 12 of the present volume there is a letter signed D. H. S. requesting some changes in the paper in regard to "Letters from sportsmen." I also have a suggestion to offer. I do this all the more freely as I have subscribed to your paper from the start; before that to the *Rod and Gun*, and before it commenced to the *Spirit of the Times*. So you see I'm an old subscriber to sporting papers. My suggestion is this: that you publish at least the name of the State (if not that of the place) from which your letters and communications are sent. In a large country like the United States where there are all kinds of game, from those of the sub-arctic to those of the *quasi* tropical, and where various and different kinds of hunting are in use, it is not only interesting, but absolutely necessary to know from what State the letter is sent. Much the more so as two great sections of the country, viz: the Northeast and the South and Southwest are so different in feeling, in thought, in ways of looking at things, in belief, customs and manners that it becomes imperative for a clear understanding to know where the articles are written from. I make this remark only from a wish for the complete success of the paper, as it is the paper, so far, that most devotes its columns to the interests of the lovers of field sports.

BONNIE BLUE FLAG.

## DUCKING ON THE ST. CLAIR FLATS

TORONTO, Nov. 24, 1877.

## EDITOR FOREST AND STREAM AND ROD AND GUN:

I have just returned from my annual fall holidays, which I have spent in the same place for the past seven years—viz., the St. Clair Flats—and I thought you would like to hear a little about the doings of the various gentlemen who were at the same place this fall. A year ago I was fortunate enough to have had a share in the St. Clair Flats Shooting Company offered to me, and when I took everything into consideration, I came to the conclusion to take possession of that same share, and my experience this fall has led me to the conclusion that I did a very wise thing. The company control the shooting over 20,000 acres of marsh, and were very careful in seeing that there was no spring shooting done upon their preserve. The company have had a very fine club house erected especially for the members.

The shooting this year has been better than any previous year since I have been going up there, showing thereby that when the preservation of the marsh is properly carried out, it affords the members most excellent sport. Especially is this so in regard to the big ducks, as the following incident will prove: Last year Mr. Geo. Wain, our one-handed champion boat builder, killed and brought into the club house 147 big ducks. This year, on the 25th of October, he killed 177 big ducks, consisting of mallards, black and a few pin-tails. On Nov. 6th he had another very good day, killing 123, all big ones. Other members of the club succeeded in getting the following bags, which, although not so large, are considered a good day's sport—45, 54, 55, 62, 58, 53, 51, 41, 33, besides any number of bags under 30 and over 20. The members never leave the club house until 8 a. m., and generally stop shooting about 5 p. m., sometimes earlier, just according to the distance they are away from the house.

For some unaccountable reason, the traps, blue bills and other river ducks are not so plentiful as in former seasons—at least not so in the preserve. I might, in conclusion, add that we employ no punters, and that the above bags were all made by the members personally.

T. G. C.

ORDAR RAPIDS, Iowa, Nov. 30, 1877.

## EDITOR FOREST AND STREAM AND ROD AND GUN:

In your issue of 23d inst., W. L. S. Lynn inquires for a "good single barrel breech-loader." He can procure just what he wants at Nichols & Lefever, Syracuse, N. Y. I know whereof I write. W.

## PIGEON MATCHES.

MAINE—Fozcroft, Nov. 29.—A glass ball match; the following is the score:

|                   |   |   |   |   |   |   |   |   |   |    |

\* Divided third.

\* Fell dead out of bounds.

Referee—Chas Dexter. Time of shooting—One hour and forty-five minutes.

## SPLIT BAMBOO RODS.

To our customers and the public:—In reply to the damaging reports which have been circulated respecting the quality of our split bamboo rods, by "dealers" who are unable to compete with us at our reduced prices, we have issued a circular which we shall be pleased to mail to any address, proving the falsity of their assertions.

CONROY, BISSETT & MALLESON,  
Manufacturers, 65 Fulton Street, N. Y.

## Sea and River Fishing.

### FISH IN SEASON IN DECEMBER.

|  |   |
|--|---|
| Slack Bass, <i>Micropterus salmoides</i> ..... | Yellow Perch, <i>Perca flavescens</i> ..... |
| <i>M. nigricans</i> .....                      | Sea Bass, <i>Selenops ocellatus</i> .....   |
| Pike or Pickerel, <i>Esox lucius</i> .....     | White Perch, <i>Morone americana</i> .....  |

FISH IN MARKET.—The tempestuous weather of the last week having made fishing difficult, market supplies are scarce and prices rule very high: Striped bass, 25 cents; large, 20; smelts, 25; bluefish, 15; salmon frozen, 35; mackerel, 15 to 25; Southern shad, \$1 50 each; white perch, 15 cents; Spanish mackerel, 30; green turtle, 13; terrapin, \$10 to \$36 a dozen; halibut, 20 cents; haddock, 8; codfish, 8; black fish, 15; flounders, 12; sea bass, 20; cels, 13; sturgeon, 10; sheephead, 25; scallops, per gallon, \$1 50; soft clams, per 100, 30 to 60 cents; whitefish, 15; pickerel, 15; salmon trout, 30; hard crabs, per 100, \$3.

MOVEMENTS OF THE FISHING FLEET.—The sch. Live Yankee, of this port, the last of the Bay of St. Lawrence mackereling fleet, sailed from Port Mulgrave on Friday of last week with a fare of 145 blbs. mackerel. The number of United States vessels in the bay this season has been 140, of which 86, or over 61 per cent, hailed from Gloucester. Portland had 10 vessels in the bay, Boothbay 9, Newburyport 7, and no other port over 4. The fishery proved an unprofitable one, the total catch of the fleet being 20,500 blbs. sea packed, of which 14,250 were taken by Gloucester vessels and 6,250 by vessels from other ports. Average catch 137 blbs. sea-packed, or 109 packed.

This is the season at which the Bank fleet is at its minimum, and the Georges fishery draws to a close. The number of Bank arrivals reported the past week has been 10, bringing 33,000 lbs. halibut, and 275,000 lbs. codfish. Number of Georges arrivals reported, 10; catch, 160,000 lbs codfish, and 1,000 lbs. halibut.—*Cape Ann Advertiser, Dec. 1.*

HOW TO PRESERVE FISH.—It often happens that amateur fishermen in this country catch a great deal more fish than they need for present use. Such may be glad to know the following easy method of preserving it recommended by a high scientific authority, M. d'Amelis: "The flesh, raw or boiled, and cut in slices (if the promptest results are desired), is placed in a bath formed of ordinary water and citric acid, in quantity sufficient to make it strongly acid. After two or three hours the piece is removed and subjected to moderate artificial heat or left in the open air till dry (the former takes about one hour, the latter five or six). The fish can now be kept for years in any place. To restore its flexibility, all that is needed is to keep it three or four days in fresh water. Entire fish may be preserved in this way after removal of the intestines." Adirondack fish dried this summer have proved delicious.

PENNSYLVANIA, *Leroyville, Nov. 26.*—The picturesque Mountain Lake is situated in the town of Burlington, Bradford Co., Pa., some ten miles from the county seat Towanda. It is nearly round, and with an area of one hundred acres. The water is clear and deep, and well-stocked with pike, yellow perch and sunfish. It has a broken border of cleared land and woods, and on its western bank is a large plot from which the small brush has been cleared away, leaving the larger trees, which form a grove where many a picnic is held each year. At several places boats are furnished, all very tastily painted and provided with all the necessities which add to the comfort of the fisherman. ANGLER.

## National Pastimes.

KNICKERBOCKER ATHLETIC ASSOCIATION.—The inaugural meeting of this new club was held at the American Institute Building last Monday evening. The sports were witnessed by about five hundred spectators. The walk is oblong, perfectly level and one-eighth of a mile around. How the young athletes acquitted themselves may be seen from the subjoined summary:

Eleven events were on the programme which had eighty-eight entries. Trial heats of a dash of seventy-five yards opened the sports. The final heat brought F. Henshaw, Harlem Athletic Club; G. McNichol, Scottish-American Club; and J. B. Elliott, of Greenpoint, to the scratch. Elliott landed the winner in rare good shape by two yards in 8 1/2 seconds. Among the winners of the trial heats was M. McPaul, of the Fanwood Athletic Club, who is a deaf-mute. It was his first public race, and he ran very creditably. The champion amateur pedestriar, T. H. Armstrong, Harlem Athletic Club, won the one mile walk in 7m 32s, beating, in his old time style, T. J. Mort, of the same club, and G. Buckley, Scottish-American Club. The latter finished second, but was disqualified. Twelve started in the open dash of one-quarter of a mile. A. B. Pierson, Waverly Athletic Club, Newark, won the final heat and secured first prize in 1m 38s. G. McNichol, Scottish-American Club, was announced as the best man in the running broad jump a 17ft 3 1/2in, though the decision was questioned by the friends of W. T. Livingston, Harlem Athletic Club, who reached 17ft 2in on the ground of an error in measurement. W. Hayes jumped 15ft 9 1/2in. In the three mile walk T. H. Armstrong again proved the winner. He beat T. Bulkeley and J. J. McLeod easily. Armstrong's time was: First mile, 7m 29 1/2s; two miles, 15m 55 1/2s; three miles, 24m 32 1/2s. J. B. Hanna, with 5ft 1in, was awarded first prize in the running high jump. J. Christian, Scottish-American Club, had no difficulty in winning the one mile run from H. O. Rommel, Triton Boat Club, in 5m 23 1/2s, and A. W. Adams, Scottish-American, put the shot 34ft 11 1/2in, just 2ft 7 1/2in further than McNulty, who obtained second prize. W. F. Myers, Orion Rowing and Athletic Association, captured the hurdle race, 120 yards, ten flights, the final heat being in 13 1/2s. Frank M. Clinch secured the club quarter mile in 1m 6 1/2s, and the half mile dash fell to W. J. McNulty, Union College, Schenectady, N. Y., in 2m 26s.

SCOTTISH AMERICAN ATHLETIC CLUB.—The third annual handicap games were held at the club grounds, No. 339 W. 54th Street, Dec. 1. The entries and winners were as follows:

Two hundred and twenty yard run, trial heats, first in each heat to run in the final heat. First heat C. Stewart won in 34s. the second heat was run alone by Mr. J. Knox in 36s, the third by H. H. Moritz in 34 1/2s, and the fourth, between Messrs. Fabrigou and E. Arnold, was won by the latter in 28 1/2s. One mile walk was won by G. A. Lundin, 2m start, in 8m 12s. In the running high jump J. B. Hanna, won, 5ft 1in. This gentleman, who was allowed 3 inches by Mr. Knox, was therefore the winner. Putting the shot was won by Hann a with handicap of 11ft. The half mile run.—Messrs. Arnold, Fabrigou and Hanna took part. Hanna gave the first mentioned 60 yards and the second 30 yards start. Arnold won easily in 2m 19 1/2s. There were three entries in vaulting with the pole, M. E. More, J. B. Hanna and J. Knox. More won by 4in. He cleared the bar when 7ft 4in from the ground. The 440 yard run, trial heats, first and second in each heat to run in final heat. In the first heat Knox won; the time was 65s. The second heat was between Messrs. Stewart, Moritz and Arnold, who won. Time, 50 1/2s. He had ten yards start of Stewart and five of Moritz.

The next feature was the final heat of the 220 yard run between Messrs. Arnold, Moritz and Knox. The men reached the string in this order, Mr. Arnold's time being 27s.

The three mile walk was won by J. J. McLeod, O Connor was second, J. L. Newberry third and T. Buckley fourth. The winner's time was 27m 7s. Connor's was 36s behind.

Then came the final heat of the 440 yards run between Messrs. Arnold, Moritz, Knox and Fabrigou. Mr. Arnold won in 50 1/2s; Moritz was second and Knox third. The games closed with the "lug of war," ten men on each team.

For Forest and Stream and Rod and Gun.

## AMONG THE MOUNTAINS IN SOUTHERN CALIFORNIA.

I DOUBT if any State in the Union presents a more attractive field for the hunter or sportsman than California. Since its completion the Texas Pacific R. R. proceeds the entire length of the State to the Colorado River, making its way through the valleys at the foot of the Sierra Nevada and Sierra Madras, and thus presenting to the hunter 500 miles of magnificent ground unsurpassed for accessibility, extent and variety of game. In the mountains may be found the grizzly, cinnamon and black bear, deer and the California lion—which, by the way, is a notorious coward. The deer and antelope migrate to the lower levels during the winter months. Here are also seen the mountain quail, a lordly bird, which is as white-meated as a chicken, and attains a large size. On the plains are numberless quail and hares, and on the lagoons and rivers, in the winter, may be found immense quantities of wild geese, canvas-back and mallard ducks with the more common varieties. Approaching in great flocks during the months of October and November for their winter's sojourn, they remain until spring, infesting the rivers and grain fields of the upper and lower Santa Anna valleys, offering rare sport.

These mild, sunny, winter days find me occupying, as a centre from which to make excursions, a charming little town in the upper valley. To the north, twenty miles distant—but apparently but five in this pure clear air—lofty Cocamunga, rising abruptly from the plain, uplifts 11,000 feet of serrated cliffs and canyons. The approach is from the eastern slope, where the canyon pass, forming a gate through the Sierra Madras at this point, allows a comparatively easy access to its otherwise inaccessible heights. In its woody canyons are all the varieties of our mountain game.

A few years ago one had the surety of a fine basketful of trout on many of the streams, but of late the fishing is not as satisfactory. On the San Bernardino range, however, which makes its way Southward from the Cajon Pass, there are several streams, at the head waters of which, if you are good at climbing, can be had fine fishing. The springs are icy cold, thus giving the trout an excellent fineness and flavor. But the true paradise of the camper—the Mecca of the sportsman—is San Jacinto, which reposes in its rugged outlines

forty miles to the South. Its characteristics are a series of densely wooded mountain valleys on a plateau 5,000 feet in altitude. High above these springs the crested peak of Tock-witch (Devil), 4,000 feet high, the mysterious land of the clouds. Leaving horses behind, a difficult trail leads you upward to the gateway between the peaks, through which you pass into the Tockwitch Valley. This has been invested with a sort of superstitious interest by the dwellers of this mountain land. There are rumors of an extinct crater, a lost ledge of solid gold, a wild man of the mountains, and I know not what else. This belief is heightened by an occasional dull, heavy booming which is heard on the clearest days. This has since been explained by scientific parties as being reverberations of thunder along the Colorado River. But whatever else this valley may contain there are numerous gleus and small valleys wooded with the pine and mountain oak, watered with icy cold springs, with an abundance of green grass. Here the deer are reported to migrate in droves during the dry, parched summer of the lower plains.

We had been in the lower mountain valleys for several days, enjoying very good sport among the squirrels and mountain quails, with an occasional shot at a deer, but owing to the rapid settlement of these valleys of late by lumbermen, with two sawmills also in operation, they had evidently chosen remoter covers. This was likewise apparently the case with bears, although one Thomas, a wealthy stock owner, had recently succeeded in poisoning a 2,200-lbs. grizzly in this vicinity, and the tracks of another had been discovered a few days previous which measured nine inches by fourteen inches.

We were thus in a fair way of continuing our diet on squirrel and the mountain quail—which, by the way, is a noble bird, and deserving of further mention—when a friend providently brought in a haunch of a yearling calf in a fine condition, which he had shot from a noble herd of deer the day before. This decided us for an extended hunt, and a few days later found us, devoid of all superfluous articles, toiling our way over the divide into this valley of mystery. A day of reconnoitering followed, resulting in the selection of a fine camping place on the eastern slope of the highest peak, which towered above us, giving promise of magnificent views. Night soon fell about us, the cool, thin air necessitating a roaring fire, about which we gathered with pipes and stories until, tired with our long tramp, one by one we sank into oblivion. The next morning, just as the old gray sentinel above us was catching the first rays of the sun, while the valleys were yet in shadow, and C., engaged in replenishing the fire, was admonishing us to up and make ready for the day's sport, a distant, whiplike crack of the rifle made known to us that one of our ambitious Nimrods was absent on the chase thus early. Some time elapsed, during which the quail were taking on a beautiful brown and the coffee was steaming furiously, when H. burst in upon us, puffing with excitement and the thin air, informing us that he had come upon a drove of fine deer in a ravine hard by, which being shot at made off up a long, narrow valley, which had given indications the day before of being a good cover, as large patches of grass on its side showed existence of springs. Our breakfast was soon dispatched and the plans for the day's campaign completed.

C. and myself making a long detour, struck the upper end of the valley, where we separated in the thick *manzanita* bush, each taking a side of the ravine. After beating about for some time, losing my companion in the meantime, and hearing an occasional rifle-crack, I climbed the ridge, discovering on the other side a beautiful little valley running parallel with the one I had left. Slowly descending, I had nearly reached the bottom, where a small stream made its way, when there came a succession of rifle-shots but a short distance below. Surmising that this came from H.'s Winchester, I quickly got into cover, and had waited but a short time when there was a quick, nervous rustling through the bushes, and out sprang a buck, quickly followed by several does hardly fifty yards distant.

Rising quickly, I took a steady aim at a fine-looking animal in the centre of the drove, and, firing, had the satisfaction of seeing her jump high in the air and fall with a few brief struggles, while the others immediately made off up the ridge and disappeared. H. and myself soon reached the rendezvous with our game, where, comparing notes, we found the result of the day's sport to be three fine deer. Twenty-one had been seen during the day.

An ascent of the peak was decided on as the programme for the morrow, and owing to its apparently volcanic origin, it looked a somewhat dubious task. Devoid of trees, it rose a battlement of granite cliffs and precipitous slopes of huge boulders, which early dawn found our party engaged in scaling. Several hours of exceedingly hard climbing followed, and occasionally finding ourselves debarr'd from further progress by insurmountable difficulties, a movement to the rear was necessary in order to find a new trail. Finally, all difficulties overcome, we stood, a panting crowd, on the topmost ridge, 9,000 feet in mid-air, feasting our eyes on the full magnificence of the scene, occasional glimpses of which we had caught as we drew near the top. The San Geronio Pass lay below, a vast chasm between ourselves and Mt. San Bernardino and its consort, the old "Gray Back," with an altitude of over 12,000 feet, looked the very home of glaciers and snow, its round smooth back showing bleak and bare. Out through the Pass to the eastward, the Colorado desert stretched in interminable desolation, a vast sea like ruin.

We turn to a more agreeable scene. Reposing between the Sierra Madras, which form a huge protecting wall on the north, and the hazy, picturesque coast range on the south, the Santa Anna Valley presents a scene of loveliness. Over the coast range, apparently leaving the base of Mt. St. Jago, appears the Pacific, ninety miles distant. With a good glass, vessels can plainly be discerned through the dry, electric atmosphere. As we were to break camp that day, our time was limited. Reluctantly turning away from this panorama, a few hours later found us at our rendezvous, packed and heavily laden with our spoils, starting out with an eight-miles tramp confronting us ere we reached our lower camp.

But all things come to an end, and finally the welcome sight of T.'s cabin, dwarfed by the lofty shadowy pines which overhung it, and seeming almost Lilliputian in size, met our view. We made this our headquarters for several days, piloted by T., the veteran hunter, on various excursions, until the time arrived for our departure. As we rode along through the winding valleys, under immense pines, oaks and cedars, over a clean carpet of grass and ferns, the latter just turning and rivaling our New England autumn leaves in their flaming tints, deeply did we regret our departure from this grand old mountain park. A ride of forty miles through the beautiful valleys of San Jacinto and Kaweah and we entered Riverside just as the sun was sinking behind Mt. St. Jago and Temescal, hazy and blue in the West.

# NICHOLS & LEFEBVER, MAKERS OF FINE GUNS

CATALOGUES SENT ON APPLICATION.

SYRACUSE, N. Y.

## ACME CLUB SKATE.

The only reliable Self-Fastening Skate ever invented. Can be instantly and firmly attached to any boot. Requires no heel plates, at ap's, nor key. Price per pair \$5. Nickel Plate \$6. Sent by Mail, post-paid on receipt of price, or by Express C. O. D. Send stamp for illustrated price-list of Skates, Revolvers, Novelties and other Sportsmen's Goods. Trade supplied by  
Mention FOREST AND STREAM.

ELISH & SIMPSON, 132 Nassau street, N. Y.

## W. W. Greener's Patent Wedge Fast, Hammerless Breech-Loader.

THE GUN OF THE FUTURE.

It has already made its mark in Great Britain. The self-cocking is effected by the raising of the breech ends of the barrels for loading, and opens smoothly and without requiring much force to open the gun and cock the locks. There is a safety bolt at the side which answers for half cock. The mechanism of this action is exceedingly strong and simple, and is better suited for hard work than any other gun in use.

W. W. GREENER winner of the great London Gun Trials of 1876 and 1877, beating 121 guns by all the best makers of London, Birmingham, Edinburgh and Dublin.

These guns are warranted to kill game at 100 yards. Read W. W. GREENER'S book on Choke-Bore Guns and How to Load, published by Messrs. Cassell, Petter & Galpin, New York.

Address,

ST. MARY'S WORKS, Birmingham and 68 Haymarket, London.

## Sportsmen, Attention!

## Keep Your Feet Dry.

The only premium awarded by the Centennial Commission, Philadelphia, 1876, for Alligator Waterproof Boots and Shoes.

Goods sent to all parts of the U. S., C. O. D.

Catalogues containing full instructions for self-measurement sent free on application.

503 Broadway, New York.

## NEW YORK SHOOTING COAT.

A stylish, handsome Coat. First-class in every particular. Pleasant to wear, durable, and in the end the cheapest.

MADE OF BROWN VELVETEEN.

Pockets and lining made to take out, so that it may be worn for early fall and winter shooting. (Horace Smith, Esq., says: "It is my idea of a shooting coat. I have worn them for several years, and would have none other.") Price for Coat, \$35; Vest, \$6.50. Also the best brown cutaway pants at \$10 per pair. I make only the one grade, as the cheapest goods do not turn brains and will not give satisfaction.

Also, in addition to the above, I am making a Waterproof Canvas Suit, cut same style as the Velveteen; goods, not stiff and hard, but soft and pleasant to wear; guaranteed to turn water. Sportsmen who have seen it say it is the best yet. Coat, \$5.50. For full suit, \$14.00. I also make the sleeveless Coat, Vest with sleeves if desired. Rules for measurement and samples sent upon application.

F. L. SHELDON, Rahway, N. J.

## SHOOTING SUIT.

Manufactured only by

**W. SIMMONS & SON,**

BOSTON.

Each article—coat, trousers, vest and hat—have the name and manufacturer's address stamped upon it, and no suit is genuine without it bears this imprint.

The suit can be sent, securely packed, by mail to any part of the United States or Canada on receipt of \$1.25 above the price of the suit.

We make no discount except to the trade. We make but one quality, and that is the VERY BEST. The price of the suit complete is \$13.

The suit consists of coat, trousers, vest, and choice of either cap with havelock, or hat.

The material is of the best quality of duck, waterproofed by a patent process. The color is that known as "dead grass shade."

The seams and pocket corners are riveted, and nothing is neglected to make the whole suit complete in every way.

## OUR PATENT DECOYS

have entirely superseded the old-fashioned cumbersome, wooden decoys. The birds are hollow, and six of them occupy about the space of one wooden decoy. The Duck Decoys of all kinds are \$12 per dozen: geese, \$8 each; yellow leg, \$1.25 per dozen; black breast plover, \$3.75 per dozen; red breast plover, \$3.75 per dozen; golden plover, \$3.75 per dozen; turnstone, chicken plover, etc., \$3.75 per dozen; sandpipers, \$3.00 per dozen. We are now making standing geese for field shooting.

## THE HUNTER'S TENT

made of tan-colored duck; light, easily transported. Size, 7 ft. by 8 ft. Price, \$10 complete, made on the umbrella principle, folding into a neat roll 3 feet long.

The judges' report at Philadelphia says were commended for excellence in every part. Very novel and practicable; adapted to all out-of-door purposes where lawn, beach, hunters and camp tents are used; quick folding; all sides strongly fortified; enables them to stand against wind and rain. Rev. F. B. Savage, of Albany, N. Y., who camps out in Florida in winter, and the Adirondacks in summer, writes this about the tents:

ALBANY, July 31, 1877.

SIR:—I have just returned from a three-weeks' camping expedition in the Adirondacks, and have had the three tents bought of you put to the severest tests of exposure both as to wind and storm, and I do most unhesitatingly say they are the most complete thing of the kind I ever used.

1st. They are easily put up or taken down.  
2d. They are perfectly waterproof.  
3d. They are a good height, and all the room I available.

Our party asked for no better. They were admired by all who saw them, and one party insisted on buying one of ours that was to spare. Rev. Dr. Duryea, of Brooklyn, and the Rev. Dr. Irwin, of Troy, both endorse what I say about your tent. With kind regards, yours truly,  
F. B. SAVAGE.

Tan-Colored Leather Pliable  
Waterproof Suits.

In Shooting Coats, Jackets, Breeches, Vests and Hats at following prices: Coats, \$22; Breeches, \$15; Jackets, \$18; Vests, \$12. These form the most elegant shooting equipment known. They are indestructible.

A recent notice in the FOREST AND STREAM from a correspondent, says:

Whenever a sportsman, or even one who does not claim the distinction, finds a really good and useful article, it is no more than fair that he should let others have the benefit of his knowledge. For this reason we would call attention to the Tan-colored Leather Shooting or Fishing Suits, made by G. W. SIMMONS & SON, of Boston, Mass., the manufacturers of the famous "Boston Shooting Suit."

I saw these goods advertised in your paper, and wrote to the parties for samples. I found the material as soft and pliable as a piece of kid. I tested it by soaking in water twelve hours, and found it as nearly waterproof as one could desire, and after drying was happily surprised to find it had not stiffened in the least. I have since then received a full suit—coat, vest and breeches—ordered by letter from measure taken by myself.

The goods are splendidly made, well lined with fannel; in fact I do not see how they can be improved.

My friends are unanimous in their verdict that G. W. Simmons & Son's leather goods cannot be excelled in quality or beaten in price.

For every kind of sportsmen's goods address

**G. W. SIMMONS & SON,**  
Oak Hall, Boston, Mass.

## Sportsmen's Goods.

## Attention, Sportsmen!

Each leader adapted to 10 and 12 gauge metal or paper shells of any length, each shell being accurately charged and wadded complete in one operation. Amount of charge readily adjusted. Highly endorsed by sportsmen and the press. Having perfected arrangements for manufacturing in large lots, we have reduced the price to \$2. Manufactured only by CAMP & WISE, Stonington, Dane County, Wis. All orders for sample loaders must contain remittance. Dec 6 8m

## "THE OOLOGIST,"

A MONTHLY JOURNAL DEVOTED EXCLUSIVELY TO BIRDS AND BIRDS' EGGS.

This magazine, the favorite of amateur ornithologists, is now in its third volume. It is replete with all that is new or recent in Ornithology and Oology, and publishes important papers on the rarest of our birds and eggs. It is just the periodical for those making collections of birds and eggs for scientific examination, as its columns are constantly furnishing descriptions of the eggs of new and rare species. Terms—Forty cents a year, in advance. Specimen copies and prospectuses only on receipt of stamp. Address,

S. L. WILLARD & CO.,  
Oneida St., Utica, N. Y.

## Camp Life in Florida.

By CHARLES HALLOCK,

AUTHOR OF THE FISHING TOURIST.

Published by Forest and Stream Publishing Co.,

No. 111 FULTON STREET, NEW YORK.

And for sale by all booksellers. Sent by mail, postage prepaid, on receipt of price (\$1.50) at office of publication.

## Fur, Fin &amp; Feather

CONTAINS THE  
GAME LAWS of all the States and the  
Canadian Provinces and a List of  
Hunting and Fishing Grounds,  
Besides, a Vast Fund of  
VALUABLE INFORMATION FOR ALL  
WHO EITHER SHOOT OR FISH.

It tells you everything you want to know about Hunting and Fishing. Where to go, How to get there, What Kind of Game and Fish you will find, and What Kind of Shooting and Fishing Tackle to Use. Ammunition, Bait, &c., and is indispensable to all who use either Gun or Rod; it is in fact, a complete HUNTING AND FISHING DIRECTORY, and no matter how much or how little recreation you take in the woods or along the streams, you will find *Fur, Fin, and Feather* worth many times its cost to you.

Each number consists of 176 to 192 large octavo pages, and in addition to the foregoing contains numerous interesting Sketches of Camp Life and Sporting Adventure that renders the work entertaining and instructive reading for every household. Not an objectionable word appears in its pages. *Fur, Fin, and Feather* is published every two months at \$3 a year; single copies, 50 cents, can be had of all News Agents, Gun Stores, Fishing Tackle Dealers, &c., or mailed, postpaid, on receipt of price. Can be had at this office.

Specimen copies, containing all the Game Laws as now in force, 25 cents, can be had only of  
CHAS. SUDAM, Publisher,  
149 Chambers Street, N. Y.

## Sportsmen's Routes.

## TO SPORTSMEN:

## THE PENNSYLVANIA R.R. CO.

Respectfully invite attention to the  
**Superior Facilities**

afforded by their lines for reaching most of the TROOPING PARKS and RACE COURSES in the Middle States. These lines being CONTINUOUS FROM ALL IMPORTANT PORTS, avoid the difficulties and dangers of reshipment, while the excellent cars which run over the smooth steel tracks enable STOCK TO BE TRANSPORTED without failure or injury.

The lines of  
Pennsylvania Railroad Company  
also reach the best localities for  
**GUNNING AND FISHING**

in Pennsylvania and New Jersey. EXCURSION TICKETS are sold at the offices of the Company in all the principal cities to KANE, RENOVIA, BEDFORD, CRESSON, RALSTON, MINNEQUA, and other well-known centers for

Trout Fishing, Wing Shooting, and Still Hunting.

Also,  
TUCKERTON, BEACH HAVEN, CAPE MAY, SQUAN, and points on the NEW JERSEY COAST, renowned for SALT WATER SPORT AFTER FIN AND FEATHER.

## Sportsmen's Routes.

## THE "FISHING LINE."

Brook Trout, Grayling and  
Black Bass Fisheries

OF NORTHERN MICHIGAN, VIA  
Grand Rapids and Indiana Railroad.

(MacKinnaw, Grand Rapids & Cincinnati Short Line.)  
Sportsmen who have cast a fly or trolled a spoon in the waters of the Grand Traverse Region will come again without solicitation. All other lovers of the Rod are invited to try these waters, wherein  
The fish named above, as also Muscalonge, Pike and Pickerel, abound.

In no other streams east of the Rocky Mountains is the famous American Grayling found in such numbers.

Brook Trout Season opens May 1st.  
Grayling Season opens June 1st.

The sportsman can readily send trophies of his skill to his friends or "Club" at home, as ice for packing fish can be had at many points.

Take your family with you. The scenery of the North Woods and lakes is very beautiful. The food is pure, dry, and bracing. The climate peculiarly beneficial to those suffering with hay fever and asthma.

The Hotel Accommodations, while plain, are, as a rule, good, far surpassing the average in countries new enough to afford the finest of fishing.

On and after June 1st Round Trip Excursion Tickets sold to Points in Grand Traverse Region, and attractive train facilities offered to tourists and sportsmen; also, on and after July 1st, MacKinnaw and Lake Superior Excursion Tickets.

Dogs, Guns, and Fishing Tackle Carried Free at owner's risk.

Grand Cuts for Fishing Parties and Families at low rates.

It is our aim to make sportsmen feel "at home" on this route. For Tourists' Guide, containing full information as to Hotels, Boats, Guides, &c., and accurate maps of the Fishing Grounds, send to FOREST AND STREAM office, or address

J. H. PAGE, G. P. & T. A., Grand Rapids, Mich.  
A. HOFFE, Eastern Passenger Agent,  
116 Market Street, Philadelphia.

C. J. STODDARD &amp; CO.,

Lock box 192, Washington, D. C.

IRA A. PAINE'S  
CHAMPION FILLED GLASS BALL.

PATENTED OCTOBER 23.

MAKE THE FEATHERS FLY WITHOUT KILLING THE BIRD--SOMETHING MUCH NEEDED.

The Bohemian Glass Works having made a specialty of the manufacture of Glass Balls for Trap Shooting for the past year, and having facilities for manufacturing cheaper and better than other establishments, have secured the services of that well-known sportsman, IRA A. PAINE, to take entire charge of the production of his new patent Feather Filled Ball, which we hold the exclusive right to make and sell.

We can give the sportsmen of America no better proof of the superiority of these balls than that V. & C. Scott & Sons, after examining every ball in the market, have ordered 3,000 to be sent to England. In no instance where it has been exhibited has it failed to take the place of all others.

Every ball is weighed and examined, then packed with the greatest care, in barrels of 300 and boxes of 500. Send for price list. Special inducements to the trade.

HEADQUARTERS BOHEMIAN GLASS WORKS, 214 Pearl Street, N. Y.

Bogardus' Patent Rough Glass Balls  
and Glass Ball Traps.

These Traps are the only ones that give satisfaction, as they are simple of construction, easily set, and not liable to get out of order, and they throw the ball in a manner that more closely resembles the flight of a bird than any other trap in the market. The Patent Rough Glass Balls are made of uniform weight and thickness, and have a corrugated surface that strengthens the ball for shipment to any part of the country, prevents the glancing of shot, and thereby insures the breaking of the ball when hit.

CAPTAIN BOGARDUS was the first to introduce the ROUGH BALL, and at a price far below the smooth ball at that time. Balls and Trap can be ordered through all Gun Dealers. Liberal discount to the Trade.

W. &amp; C. SCOTT &amp; SONS have ordered 10,000 balls and 24 traps to be sent to England.

HEADQUARTERS FOR BALLS, HAGGERTY BROS., 10 Platt Street.

Dec 6 ly

FOR TRAPS, GEO. E. HART &amp; CO., Newark, N. J.

## Match Against Time--Skill and Endurance.

GILMORE'S GARDEN, NEW YORK CITY, JANUARY 3, 1873.

CAPTAIN A. H. BOGARDUS, Champion Wing Shot of the World, has made a match to break 5,000 Glass Balls in 500 consecutive minutes, loading his own gun. Balls to be sprung from his patent traps. Shooting to commence at 3 o'clock P. M. Dec 6 ly

Price \$45. Re-boring and repairing breech-loading shot-guns done promptly and in the very best manner. Send for new price list to CHARLES GREEN, 3 West Main St., Rochester, N. Y. Aug 30 ly

THE GREEN GUN has the simplest and strongest snap-action made. The proportions and finish, the shooting qualities for penetration and pattern, are not excelled. Can bore to make any pattern ordered, from a cylinder to a full choke.

Muzzle-loaders altered to breech-loaders, with same action as new guns. Barrels bored to shoot close and strong.

## Sportsmen's Goods.

# FOREST AND STREAM ROD AND GUN

THE AMERICAN SPORTSMAN'S JOURNAL.

Terms, Four Dollars a Year.  
Ten Cents a Copy.

NEW YORK, THURSDAY, DECEMBER 13, 1877.

Volume 9.—No. 19.  
[No. 111 Fulton St., N. Y.]

For Forest and Stream and Rod and Gun.  
**AN UNKNOWN WRECK IN LABRADOR.**

HERE, on the lonely Labrador,  
Half buried in the shelly sands,  
Deserted on the idle shore,  
The wreck of some lost vessel stands.  
Its iron stanchions, ribs of oak  
And solid decks are rent and torn;  
Its sides are shatter'd by the stroke  
Of surges, seam'd and scarr'd and worn!  
Who shall the awful tale relate  
Of the dead crew, their names and fate?

Here in the elemental gloom,  
The hapless vessel met her doom;  
Helpless on Labrador's bleak coast,  
The rempest-beaten ship was tost.  
In vain, amid the grinding ice,  
Beneath the iceberg's precipice,  
By jagged reef and surken shoal  
Where white the frothy billows roll,  
In midnight gloom, in frantic gale,  
The mariners would spread the sail,  
But iron rocks and cruel wave  
Whelm'd them in unrecorded grave!

The brooding midnight hung its cloud  
Of gloom above them like a shroud;  
Only some evanescent gleam  
Fell haply from some pale moonbeam;  
No sun to pour its royal blaze,  
No star to glitter with its rays,  
To pierce the thick fogs and the haze,  
That ever, like a sable pall,  
Athwart the dreary ocean fall.

The next morn came. 'Thro' falling sleet  
An Indian comes with wandering feet,  
Beholds agast the fatal wreck,  
The splinter'd mast, the broken deck,  
And stretched along the beach outspread,  
The drifting corpses of the dead!

Year after year its dust will strow  
About them on that desert shore;  
Year after year, the ebb and flow  
Of tides shall o'er their relics pour,  
But none may know the hapless tale  
Of those who perish'd in that gale.

ISAAC McLELLAN.

For Forest and Stream and Rod and Gun.

## Catchings from the East Coast of Florida.

BY THOMAS SEDGWICK STEELE.

(Continued.)

TITUSVILLE, on Indian River, contains one church and seven houses, and to the long wharf, which extended out into the water some distance, were moored a number of sailing craft. In addition to the regular business of the saw-mill, located here, beautiful walking-sticks of crab-tree, mangrove and other woods, are turned for the curiosity shops which abound at all the ports on the St. John's River. Colonel Titus, the celebrated, from whom the town takes its name, will be long remembered "For ways that are dark," as concerned in the past outrages of "bleeding Kansas." From that State he migrated to this far-off land, and was engaged by an English company to oversee the canning and shipping of turtles and oysters, for which this river is noted. Within a year he managed to break the company, but retired rich himself, and with his gains now luxuriates in ease and comfort. I was told he once was what is called "a handsome man"—tall, erect, and of fine carriage, so that even on Broadway people turned to look at him as he passed. But now he is very cross looking, with florid complexion, and heavy gray hair and beard, but the twinkle of his bright black eyes shows that a little of the old fire remains.

There is a small boarding-house at this place where sportsmen can be accommodated, and, by combining breakfast, dinner and supper, we contrived to get one first-class meal.

Turtling is very extensively engaged in on this river. The great green turtle is captured in nets a hundred feet long, sunk for three days at a depth of twelve to fourteen feet; but these nets are frequently damaged by sharks, saw-fish and others, and require constant watching. The turtles weigh from 800 to 600 pounds, and are caught from October to Janu-

ary. The flesh is worth six cents a pound on the river, and from twenty-eight to thirty-five cents in New York city, while a capital of one hundred and fifty dollars is sufficient to establish one in the business. The yearly profits are about six hundred dollars, which, in this part of the country, is considered a small fortune.

Our stay at Titusville was brief, and we soon set sail, but, having a head wind, were only able to make a run of five miles before the "shades of night were falling fast," which obliged us to run our little craft inland and arrange our camp for the night. We had barely anchored our boat, waded ashore with blankets, guns and provisions, before it was dark, there being, as is well known, little or no twilight in these latitudes.

A description of one night's camp will answer for the entire trip, as there was little variation from day to day, and we were so fortunate as not to be visited by rain, for Florida without the sun is doleful enough.

Being without a tent, we usually located our camp under the shade of a wide-spreading palm-tree, its great leaves being a protection from the dew, which is almost equal to a rain in this region. Then came the cutting of light-wood, mangrove, and other hard substances for camp fire; and for producing an appetite, or as a preventive of dyspepsia after a hearty meal, allow me to recommend to the reader the cutting of mangrove or iron-wood trees. On account of the luxuriant growth of vegetation, it was often difficult to gather enough *dry* stubble for fire, and our experiences in northern woods were of little service to us. After supper on hard-tack and salt pork, varied by an occasional duck, we sat about the fire preparing the skins of birds for additions to our cabinet, or wrote in our journal of the day's adventures. Then we gathered the graceful palmetto leaves for our beds, divesting the trunk of the same tree of its rough, shaggy bark (sometimes called "boots") with which to renew our fire during the night, and drawing our rubber blankets over us were soon lulled to sleep by the hooting of the owls in the distant forest.

Our time being limited, and desiring to penetrate as far south as possible, we took but a short nap at our first camp, and, the wind hauling around into the north, we arose at midnight and again set sail. Pushing out into the river we took our camp-fire for a beacon, and it was not lost from sight until after many points had been doubled. For miles during that dark night we coasted along the western shore of Merritt's Island, and my guide, hoping to make time pass quickly, and soothe me to sleep (as I lay stretched out on the bottom of the boat eking out my night's rest), told me cheerful stories of murders that had happened along this river when "might makes right," finishing his anecdotes by recounting one deed in which he was the principal actor. This last story, and the thought of my present situation, drove all sleep from my eyelids, and it would have been very thoughtful in my guide, to say the least, if he had only mentioned this little fact before starting.

Indian River is from two to four miles wide, but in some parts narrower. The width of the eastern shore or reef is one to two miles, and the roar of the surf outside can be distinctly heard. The fresh breeze had now increased almost to a gale, and it was with great difficulty we could keep our little craft from swamping as sea after sea dashed over us. Never was the sun so welcomed as, after the long hours of the night, it arose in all its glory on our arrival off the mouth of Banana River, which flows on the east side of Merritt's Island.

The scenery along the river was a little monotonous. We missed our northern hills and mountains, but occasionally we passed groves of palm trees from 30 to 40 feet in height, while in the tops of the cypress grew lovely bunches of mistletoe.

Reefs extend out from every point, their sharp edges, in some places, appearing above the surface of the water, so we had to be constantly on the watch, or our boats would suffer in consequence. This river abounds in immense oysters. These bivalves were from four to six inches in length, were fair eating, but needed cultivation—the writer can produce some of the shells—but, alas, not the oysters.

A number of hermits, tired of the world's busy life, have resorted to this region, and with game and fish on every hand, find no difficulty in obtaining a living, and are never annoyed by a daily paper or the changes of fashion.

But we cannot recount the incidents of each day as they passed, suffice it to say, that every moment was occupied in some new enjoyment. We frequently landed for a tramp back

in the woods, after strange birds, curious bulbs and parasites. We found three distinct varieties of air plants, and on the beach odd shells and sea-beans. Of course we had to endure the annoyance of mosquitoes, fleas, wood-ticks, sand-flea, no-me-secs-ums and the like, but as they didn't all attack us at once, we were happy.

One day we stopped at a place called "Barker's Bluff" to refill our cask with fresh water, where we found an old log cabin, and were very politely waited on by a woman with a child in her arms and a pipe in her mouth, to the latter of which, she was giving the greater amount of attention.

Sometimes the wind was ahead during the day, or failed us altogether, and having a fine moon the last of the trip, we sailed all night long, each taking his turn managing the boat while the other slept. Our enjoyment was greatly increased by the thought that our dear friends at home were huddling around the fire, hourly watching the thermometer to see whether the mercury was going five, ten or twenty degrees below zero, while with us it was over eighty degrees above, in the shade.

We had the pleasure of examining that peculiar little lizard called a chameleon, and verifying the old stories of its fickleness. It would change from green to brown as we placed it on the leaves or the earth, almost as quickly as men now change their politics.

No true lover of nature and nature's God can for a moment sit down under the inspiring effect of these tropical forests, and examine their luxuriant vegetation and fauna, without being full sympathy with the poor Indian who felt that there was a spirit in everything. For some time we watched the motions of this chameleon, as it moved before, with its dainty-like manners, drawing itself into all kinds of contortions, dilating and contracting its sides like an india-rubber ball, and wondered if its serpentine tail was as useful as it was ornamental.

In the last few years M. Paul Bert has, through his researches, thrown great light on these curious changes of color, and the mechanism by which they appear to be accomplished. But it would be out of place here to give a detailed account of all the methods by which M. Bert has arrived at his conclusions, as we did not commence these "Etchings" with the view of enlightening our readers on the profound subject of natural history. Suffice it to say, that by a series of careful experiments he has discovered that these changes of color seem to be entirely under the control of the nervous system, and that the chameleon can no more help their taking place than a toad can help twitching its leg when pinched. By acting in various ways upon the spinal marrow and the brain, the operator can send the color to or withdraw it from any part of the body he pleases. Indeed, a previous observer was able to cause a change of color in a piece of the skin of the animal by acting upon it with electricity; and M. Bert has proved that even in the absence of the brain the usual changes can be produced by exciting the animal in any way, thus showing that they are due to that class of nervous action which physiologists name reflex, and of which sneezing is a good example. M. Bert has made some interesting experiments on the animal while under the influence of anesthetics and during sleep. It was formerly known that in the latter case, and also after death, the chameleon assumed a yellowish color, which, under the influence of light, became more or less dark. M. Bert has found that exactly the same effects are produced during anaesthesia as during natural sleep, and that light influences not only dead and sleeping chameleons, but that it modifies in a very curious fashion the coloration of the animal when wide awake. The same result is produced when the light is transmitted through glass of a deep blue color, but ceases completely when red or yellow glass is used. To render these results more decisive, Mr. Bert contrived to throw the light of a powerful lamp upon a sleeping chameleon, taking care to keep in the shade a part of the animal's back, by means of a perforated screen. The result was curious: the head, the neck, the legs, the abdomen, and the tail became of a very dark green; while the back appeared with a light brown saddle of irregular outline, with two brown spots corresponding to the holes in the screen. Again, by placing another animal, quite awake, in full sunlight, but with the forepart of its body behind a piece of red glass, and the hind-part underneath blue glass, M. Bert divided the body into two distinct parts—one of a clear green with a few reddish spots, and the other of a dark green with very prominent spots. From his researches as a whole,

M. Bert concludes: 1. The colors and the various tints which chameleons assume are due to changes in the position of the colored corpuscles, which sometimes, by sinking underneath the skin, form an opaque back-ground underneath the carulescent layer of Pouchet; sometimes, by spreading themselves out in superficial ramification, leave to the skin its yellow color, or make it appear green and black. 2. The movements of the color-bags or chromoblasts are regulated by two groups of nerves, one of which causes them to rise from below to the surface, while the other produces the opposite effect. But we have digressed very materially from the practical part of our trip, and we must leave our chameleon to his capricious reveries and take a pull at the oar of our slow sailing craft.

An incident occurred to my guide while anchored off "Barker's Bluff" a few months before, which came near putting an end to a favorite dog. This canine had been making the night melodious with his bark, which attracted the ever watchful ears of an alligator, who swam to the boat and climbed aboard, when the guide, awakening from his slumbers, raised the temperature of the air to such a degree, that Mr. Alligator beat a hasty retreat. Alligators are particularly appreciative of dogs, and many a sportsman has been bereft of his setter while retrieving water fowl, an instance having occurred at Enterprise a few days before our arrival.

Days passed, and at last we sailed through a narrow channel only half a mile wide, called the "Hole in the Wall," and soon came in sight of Fort Capron, which lies on the west bank of the river. Suddenly we were visited by a tropical wind storm which carried overboard our foremast, but lowering our mainsail immediately we ran into the dock at the fort under bare poles, while a number of its inhabitants stood watching our maneuvers with anxious eyes.

Fort Capron, on Indian River, one hundred and twenty miles from New Smyrna, was established by the United States government in the Seminole war of 1835. All that remains of the original fort is a brick chimney and the old parade grounds. From here due west to Tampa Bay, was a line of forts which had for their object the subjugation of the Indians. A gentleman by the name of Payne has now erected, near the site of the old fort, five wooden houses, which are thatched with leaves of the palm tree, often used in this part of the country for that purpose. Judge Payne is the oldest settler, and came to this country in 1849, during the second outbreak of the Indians. He is sixty-six years of age, tall, slender, long gray beard, with an iron constitution, and says he expects to live to be at "par." He is a man of intelligence, well informed on all subjects, has a fine library, and a more social, genial companion cannot be found in the country. He has accommodations at his house for at least twenty persons, and is happy to welcome all who come. Since leaving New Smyrna, it had not been our good fortune to meet with so satisfactory quarters, and we were agreeably surprised. Judge P. has three sons, one of them deputy collector of the port, who also watches Indian River inlet opposite, for smugglers, and during the past war it was a favorite passage for blockade runners.

The thermometer was 82 degrees in the shade on landing, and afterward arose to 88 degrees, and we were told that in the summer the mercury seldom rose above 90 degrees, but they were obliged to endure nine months of such heat.

Fresh tomatoes, lettuce, radishes, peas, to say nothing of guava and orange jelly (all raised on the place) were served us, quite a contrast to hard-tack and salt pork; while the neat rooms and snow-white linen were a decided change from sleeping in the open air, on beds of palmetto leaves, although not so romantic.

While on our way to the Rangely Lakes, Maine, trouting during the season of 1874, we made a pleasant traveling acquaintance by the name of Colonel Von B. who was going down into the provinces, salmon fishing. We bade each other good-bye at one of the stations, never expecting to meet again. There was but one boarder at Judge Payne's, and that individual was our former traveling companion, Colonel Von B.

In addition to the cabbage palm so plenty along the river, Judge Payne has on his grounds a number of date palms, limes, century plants, and we noticed an oleander tree, over thirteen feet high, and covered with fragrant blossoms.

The last of the Seminole tribe are located about sixty miles from here on the Kissimmee River, and borders of Lake Okeechobee. Their chief's name is Tus-keenugee, and they number about three hundred, including forty warriors. Ten days before our arrival an altercation had occurred, during which one of the settlers had assaulted the chief with a knife, and a council was called in which it was decided to wipe out the pale faces. Fort Capron was made ready for the siege, the windows and doors barricaded, and loop holes for rifles were cut in the walls, but upon further consideration on the part of the Indians, the war cloud blew over.

The fishing is excellent, pompano, sheepshead, sea bass, weakfish, turbot, jew and angel fish are caught in any quantity within a stone's throw of the fort, and when one has a bite he little knows what species will be landed. Deer, wild turkey and quail are abundant, while panthers, bears and wild cats are occasionally to be had, and Judge Payne's sons are always ready to lend their assistance to the sportsman in procuring them. Cattle and swine seem to run wild, and the latter, which are as black as coal, with a high ridge of bristles along their backs, and tusks six inches in length, are quite a formidable opponent. The cattle feed on grass in the shallow water of the river, where in droves they are frequently to be seen, but they are nevertheless very poor, and you have no desire to call for beef steak but once in Florida, for india-rubber is tender in comparison.

It was from this point that the successful Lake Okeechobee expedition, sent out by the FOREST AND STREAM, entered the everglades. This lake is distant about fifty miles to the southwest, and is the largest in Florida. Boats were conveyed on wheels, and the lake navigated for the first time by white men.

We secured fine specimens of the water turkey, or snake bird, and the snow white ibis, the latter of which measured four feet from tip to tip. Also the wood ibis (*Zantapus locustator*) and a pair of cardinal grosbeaks (*Loxia cardinalis*) which we packed with our other curiosities.

We were prevented from long tramps back in the woods on account of the extreme heat, which was very oppressive, and this in the middle of February.

To the south on the river about two miles, lies Fort Pierce, once a great trading post for the Indians, but they have now

changed their patronage to Tampa Bay, on the west coast. From here to Jupiter Inlet it is thirty-eight miles, and this brings us below latitude 27 degrees north. After passing the Halaphtiokee River the west bank is very high, but the east correspondingly low. Here is to be found the rubber tree, satin-wood, guava, mango, sea-grape, crab-wood, and the cocoanut, in addition to the cabbage and date palm. One of those curiosities of Florida, an Indian mound, has been found here, and from it no less than forty skeletons of Indians have been taken, besides implements of hunting and fishing.

On an island just inside the river is Jupiter Inlet lighthouse, one hundred and fifty feet high, and here also is located one of the five life-saving signal stations on the east coast of Florida. This house contains a French mechanical flash light, and requires the care of three men. Until recently many a poor mariner's life was saved by a rope attached to a ramrod which was fired from an old musket across the ill-fated ship, but the musket has lately been superseded by the regulation mortar.

On our return north from Fort Capron to Titusville, our "chance acquaintance," Colonel Von B., supplied us from his own stores (brought from New York), bacon, canned tomatoes, peas, soups, pickles and jellies, while Judge Payne added fresh tomatoes, limes, oranges and lemons—they were "friends in need and indeed."

Just before making a landing for camp, a large black bear crossed our bows, but on account of the darkness and want of dogs we were unable to pursue his majesty with any hope of success.

(To be Continued.)

## Fish Culture.

IOWA.—The report of the Fish Commissioner, Mr. B. F. Shaw, shows the distribution of fish in the State during the years 1876 and 1877, which was as follows:

| 1876.                                    |           |
|--|-----------|
| Native fish distributed.....             | 1,574,200 |
| Salmon and lake trout.....               | 533,000   |
| Shad.....                                | 100,000   |
| White fish.....                          | 125,000   |
| Eels.....                                | 100,000   |
| Penobscot Salmon.....                    | 50,000    |
| Land locked ".....                       | 5,000     |
| Native fish dist. from ear.....          | 319,600   |
| 1877.                                    |           |
| Lake trout.....                          | 303,500   |
| Native fish.....                         | 10,000    |
| Brook trout.....                         | 51,000    |
| Shad.....                                | 150,000   |
| California Salmon.....                   | 25,000    |
| Land locked ".....                       | 10,000    |
| California Salmon at hatching house..... | 100,000   |
| Other fish.....                          | 10,000    |
| Lake trout eggs " " ".....               | 1,750,000 |
|  | 5,315,700 |

WISCONSIN LAKE TROUT AND WHITEFISH.—Under the energetic and able management of Mr. H. W. Welsher, Superintendent of the hatching house at Milwaukee reports 4,000,000 lake trout and 15,000,000 whitefish spawn on hand at present. This is pushing things, and, barring accidents, Mr. Welsher has good hopes of turning out more fry from his hatching than have ever been turned out from any other single house in the history of fish culture.

SALMON IN VIRGINIA.—We visited the hatching-house near the river on Wednesday, and Mr. H. B. Nicholas furnished us with the following information: The commissioners sent 100,000 salmon eggs, which were received here October 13, and placed in the troughs on that and the following day. On the 18th they commenced hatching, and in ten days the troughs were full of small salmon, about 90,000 eggs being hatched out. On the 28th day of the present month the little sacs disappeared and feeding commenced. The little fellows are doing well, and will soon be ready for distribution. About 40,000 will be placed in the North and South rivers, and the balance Colonel McDonald will distribute according to his judgment in other streams of the State. The hatching-house was not at all injured by the flood.—*Lexington (Va.) Gazette and Citizen.*

FISH FROM THE SANDWICH ISLANDS.—Some time ago the Chairman of the Fish Commission sent to the Sandwich Islands about 30,000 salmon and trout eggs, consigned to A. W. Bush of the firm of Friel & Bush. The salmon eggs were placed in a pond at Ewa. A Honolulu paper received by the last steamer chronicles the successful hatching of the eggs, the percentage of loss being very small. It also adds: "The trout ova, previously sent by Mr. Redding, was also successfully hatched, and the young strangers have been placed in the stream of Waipahu, where they appear to be thriving. With the salmon, which, as is well known, is a deep-water fish, returning annually to its spawning place, it is proposed—if the experiment turns out a success—to stock our principal island rivers." In return for these fish our Commission received about 100 of the aha, the choice fish of the Sandwich Islands, and a dozen mullet. More of the latter will soon be received in exchange for eggs sent by the Commission. These fish have all been placed in the water at Bridgeport, Solano county, where they may find salt water, brackish water and fresh, to each of which they are partial at different seasons. Specimens of the aha were sent on to Professor Baird of the United States Fish Commission, who submitted them for scientific consideration to Prof. Theodore Gill, the head of the ichthyological department of the Smithsonian Institute. The latter reports in brief: "The aha is found described in the books *Chanos Cypridella*, Valenciennes. The English name is milk fish, on account of the sweetness of the flesh. But little is known as regards its habits. It is said to attain a large size, being sometimes as much as three and a half feet in length. Letters to the Fish Commission from the Sandwich Islands say that the fish under favorable conditions reaches a weight of six or seven pounds. They will prove a valuable addition to our food fishes, but afford no sport to the angler, as they never take the hook.—*San Francisco Chronicle, Nov. 29.*

—At the Aquarium some 5,000 eggs of the brook trout come from Covey in Franklin County, Pennsylvania, all being hatched out by means of the Ferguson jar for Mr. Perry Belmont. Mr. Belmont purposes stocking his streams in Long Island with the young fish.

—The hatching of the California salmon in the Aquarium has been quite successful. Of a large quantity produced, not one per cent. have died. The fish are now large enough to be hand-fed. One of the great uses of the Aquarium would be to stock gentlemen's premises with young fish precisely in this way.

## Natural History.

### THE MARINE CARNIVORA.

NOT many days ago I heard a gentleman of very intelligent appearance, while watching the feeding of the seals on fish in the Zoological Garden of Philadelphia, quote to his companion the philosophical fishermen in Pericles: "Master, I marvel how the fishes live in the sea." "Why, as men do a-land; the great ones eat up the little ones."

Now, I do not say that this particular gentleman did not know any better—perhaps he did, and if so I beg his pardon for taking him as the example of a class, but the incident is very suggestive of the ignorance prevailing among most visitors to zoological gardens, with respect to what they go there to see.

Probably the larger proportion of those who do not make more or less of a study of the forms of animal life which surround them, look on the seal as a fish, and an equally large proportion of those remaining, while they have an idea that it is not really a fish, take it to be a sort of whale—which in turn they are not quite sure of—or, as I have been asked, "What is the difference between a seal and a porpoise?" Now, for the benefit of such of these as may occasionally turn for information to the pages of FOREST AND STREAM I propose to tell them what a seal is. The seals are a sub-group of the same order (*Carnivora*) to which the lion, dog, wolf, bear, skunk, etc., all belong. What fish-like appearance pertains to them is owing to the power which nature everywhere manifests of adapting her organic forms to the mode of life under which they have been produced. Their resemblance to the whale, however, may perhaps be accounted for on grounds of relationship, closer than that which all forms doubtless bear toward each other; the discovery of *Zeuglodon* and other fossil forms indicating the previous existence of a group intermediate between seals and cetaceans. The group of seals has been termed *Pinnipedia* or fin-footed as opposed to the land carnivores, constituting the *Fissipedia* or split-footed.

All the Marine carnivora were originally included by Linnaeus in one genus, *Phoca*. Buffon, however, somewhere later, recognized two natural groups into which all the forms fell by reason of a very obvious character—the absence or presence of an external ear. The French naturalist, Peron, in 1810, constituted these groups into two genera, to which he gave the names of *Phoca* and *Otaria*. Brooke, some years later, arranged them into three families, according to the classification which is still adopted: the Eared Seals, the Earless Seals and the Walruses, now known respectively by the names of *Otariidae*, *Phocidae* and *Trichechidae*.

The various modifications of structure to be found among the seals offer, perhaps, the best instance existing of the adaptation of form to necessities—the rounded outline of the body together with the close pressed hair; directed uniformly backward, affording the least possible resistance to the yielding medium in which they habitually live, while the powerful development of the extremities in many species enables them to move on land with much greater ease than is known in any other marine animal, and the tough, leathery skin which covers both hands and feet, serves the purpose of the webbed foot of the duck, when in the water, and answers by its toughness to protect them from injury against the rocks when transformed into means of terrestrial progression. The nostrils are mere slits in the extremity of the nose, and can be firmly closed at will by the animal to exclude the water, while the structure of the lungs and the enormous quantity of blood contained in their arteries enables them to remain for a considerable length of time without a fresh supply of air—it has been stated that the seal can remain from a half to three-quarters of an hour under water. I have myself timed one for twenty-five minutes, although the average duration of their immersion is much less—probably not over five or six minutes. The ear in the *Otariidae* is so tightly rolled as to prevent the entrance of water, and in the *Phocidae*, in which the ear consists externally of a mere orifice into which the tip of the little finger might be inserted, there is a valve with which the opening can be completely closed. The eye, too, has a covering like the nictitating membrane of the eye of a bird, which can be drawn over it at will, protecting its delicate apparatus from contact with foreign substances, while its transparency does not admit of any interference with the powers of sight. The brain of the seal is very large and many species give evidence of an intelligence which is susceptible of much training. It was a popular opinion among the ancients that the seal possessed the faculty of recognizing the sound of music, and that they were perceptibly affected by its influence.

This belief has been handed down to the present day, and was adverted to by Mr. R. Brown, in a paper on the Seals of Greenland, published a few years ago in the Proceedings of the Zoological Society of London, in which he states that he has frequently seen seals raise their heads and listen intently to the sea songs of the sailors as they dragged their boats over the ice floes. It is hard to doubt the conclusions of so trained and accurate an observer, but I confess that experiments on the seals in the Philadelphia Garden have rendered me somewhat skeptical on this point.

The seal being an animal of a considerable grade of intelligence, pays much attention, in an inquisitive sort of a way, to whatever is going on around it; and I have so far failed to convince myself that the animal, unless "possessing" a specially

musical education, makes any marked distinction between a sound of musical character and any other noise which may attract its attention.

The male eared seal is of large size and very robust build, and in general attains a bulk much exceeding that of the female. In some genera, as *Eumetopias* and *Otaria*, he is further distinguished by a heavy growth of hair forming a sort of short mane on the neck and shoulders, from which has been given to these species the name of Sea Lion. The character by which these seals may be most readily distinguished is the presence of a visible external ear; this is never more than an inch and a half long, is rolled tightly in the form of a cone, and stands out from the head, though directed backward.

The hair is of two kinds, one longish coat of stiff hairs, generally of some shade from light yellowish brown to a shade almost black, and another coat of soft, short hair, closely laid along the skin around the bases of the longer ones. In some genera this fur is thin and scanty, while in others it is very thick and plentiful, giving rise by its qualities to the distinctive names of Hair Seals and Fur Seals. The nose and extremities are usually bare, and the upper lip has a moustache of long, stiff, grayish white hairs.

The fore and hind limbs are enclosed within the mass of body almost to the wrist and ankle joints. The hands and feet are covered with an extremely tough, leathery skin, which almost defies cutting. On the hands each finger bears a small aborted nail, beyond which the skin is prolonged for several inches, on the foot this prolongation is slit, forming a sort of flapper to each toe; the big and little toe have no nails, or very small ones, while the three middle toes have them well developed almost into claws. All the *Otaridae* are able to move with much freedom on land—the extremities being sufficiently strong to bear the weight of the animal raised on all fours like an ordinary quadruped. Its advance is then made by an alternate raising of the head, throwing forward the fore part of the body, and then by curving the spine upward bringing the hinder extremities forward under the body, at the same time spreading them out laterally. By a repetition of this movement they advance at a considerable rate of speed by a gait somewhat ungracefully resembling the canter of a horse. A most astonishing instance of the agility with which these creatures move on land recently came under my notice. A male hair seal about five and a half feet long was brought to the Garden and placed in a pond surrounded with an iron wire fence about three feet high. In another pond a few yards distant were three more males of the same species, with whom he was anxious to fight.

Some time during the first night after he was put in the pond he was discovered by the watchman fast in a turnstile exit gate, at the lower end of the grounds, about three hundred yards from his proper domicile. He was put back, but repeated his feat so frequently that it was necessary to raise the height of the fence until he was broken of the habit.

The mode of getting over the fence was precisely such as would be adopted by a man of active habits. The body was raised until the forelimbs could be rested on the top bar, and then by a violent spring from the tail the body was thrown, just as the man would vault, over the fence, landing without harm on the other side.

The pace of the animal, when hurried, was quite rapid; indeed, a keeper who was sent to coax it back with a fish speedily found that the seal could make about as good time as he could and he was obliged to drop the bait and look out for himself. Both this male and the smaller female in the same tank climb up the perpendicular wall when the water is let off—a height of about six feet, broken only by several small projecting stones—they also drop from a considerable height either on the rocks or into the water without injury, their tough skins and a thick layer of fat immediately beneath serving to protect them.

The *Otaridae* are all polygamous; the harem of a large and powerful bull, usually containing from ten to twenty females. The period of gestation, as nearly as has been ascertained, is about eleven months, varying probably a little in different species. The young are born about June; generally only one, though occasionally twins being produced.

From time immemorial disputes have been current among naturalists as to the number of true species into which the seals should be divided. Numbers of species were established on no better evidence than a single specimen, which in many cases was afterward shown to be but a special state or stage of growth of some other form; and it was also proved that the skull, which has been one of the leading features in the classification of the *Otaridae*, was subject to a vast amount of variation in different individuals of the same species. So the species were gradually reduced to about fifteen in number, and, later still, Prof. J. A. Allen, in a valuable paper on the *Otaridae*, published in the Proceedings of the Essex Institute for 1866, reduced the whole number to less than ten well-marked species, belonging to five genera. These are found on both sides of the Pacific Ocean, from the Arctic to the Antarctic regions, one species only ranging up the Atlantic coast of South America as far as Brazil.

The geographical distribution of these animals, so far as it has been ascertained, is very striking, there being one genus of fur seals toward each pole, and one genus of sea lions intermingling slightly with these, and extending southward from the north, and northward from the south, occupying the space intermediate between the fur seals and the fifth genus, containing two species very closely allied to each other, and occupying respectively the north and south waters of the

equatorial zone, the genera being thus evenly balanced in the two hemispheres.

It is believed that the habits of the different members of these groups differ to a very slight degree. It will therefore be amply sufficient to take one of the best known as typical of them all.

That one which has been most carefully studied is the Fur Seal of the North (*Callorhinus ursinus*), known among the early voyagers and naturalists as Steller's Sea Bear. The fully grown male of Alaska and the Pribilof Islands, where are located the most extensive "rookeries"—as the breeding places of the seals are technically termed—grows to a length of six or seven feet, and a weight of five to six hundred pounds, the females in most cases weighing not more than a fourth or fifth as much. In appearance this seal does not differ much from others of his family, but that which constitutes him *par excellence* the prince of seals, is the thickness of his soft undercoat of fur, lying beneath the longer hairs, which are all that is visible externally. This it is that furnishes the sealskin of commerce, and causes annually so great a slaughter of its unfortunate natural owners. It will not be without interest to give some details of the social economy of this seal, as its habits may be taken as illustrative of those of all the eared seals. It is well known that almost all the members of this species pass eight or nine months of the year far out to sea, spread over the whole North Pacific, coming to the shore only at the time and for purposes connected with breeding. They, then, for a time, become land animals.

The "rookeries" are generally selected along the shores of an island, or in some cases the mainland itself, and are resorted to each year successively. The Pribilof group of islands, about lat. 57 deg N., in the Sea of Kamtschatka, is the favorite spot on the American coast of the North Pacific.

The seals make their first appearance in May, when the snow and ice is well melted, the most eager and vigorous of the bulls coming first to see that things are all right, and to select their favorite station, not too far from the water. For among them he who comes first is first served, and fares the best all through the season, provided he is physically able to protect his choice and hold it against all comers. Through the month of May and into June the males continue to arrive, each one as fast as he comes taking up his station on the beach waiting for the arrival of the female part of the community. These do not generally come in from the open sea until summer has well set in, from the middle to the last of June. No sooner do they appear than the work of selection begins on the part of the bulls, and the females are coaxed, bitten, driven and thrashed to the few square yards of rock which have been pre-empted by their lord and master. Some of the larger bulls succeed in getting as many as twenty cows under their charge, and many and bloody are the battles that must be fought to keep covetous outsiders from stealing them away. Mr. Henry M. Elliott, in his report to the Government on the Territory of Alaska, has a very interesting chapter on the seal fisheries. Of the battles waged by the bulls at this season, he writes as follows:

"Some of these bulls show wonderful strength and courage. I have marked one veteran who was among the first to take up his position, and that one on the water line, when at least fifty or sixty desperate battles were fought victoriously by him with nearly as many different seals who coveted his position, and when the fighting season was over (after the cows have mostly all hauled up), I saw him covered with scars and gashes, raw and bloody, an eye gouged out, but lording it bravely over his harem of fifteen or twenty cows, all huddled together on the same spot he had first chosen."

Very soon after the landing of the females the young are produced, and this period is shortly followed by the beginning of the season of rutting. This being over early in August, the bulls begin to return to the water, having been absent from it for at least two months, wholly without food, having been engaged unremittingly either in attentions to their seraglio or in furious fights for their protection. They are consequently much weakened and emaciated, and at once go out in search of food, whence they do not return much before the whole colony breaks up for the season. The cows are left in almost undisturbed possession of the beach to nurse their young, and instruct them in the art of swimming, in which it is necessary for them to become proficient before the time of leaving. The young at birth are somewhat over a foot long, and rarely weigh more than seven or eight pounds, but by the end of September they have grown to a considerable size, and are able to go with the main body on their winter cruise.

The seals which are legitimately killed at the fisheries consist mostly of those bulls comprising a half, or perhaps two-thirds of the whole male population, who have been prevented by the larger and stronger ones from visiting the breeding-grounds. These "bachelors," as they are called, are therefore compelled to herd by themselves at a point apart from the rest. They are then surrounded and driven inland without difficulty, a distance in some cases of five or six miles, to the slaughtering-grounds, where they are readily dispatched by a blow on the head. The skins are packed in salt, baled and shipped to the manufactory, where they are put through a variety of processes in the course of preparation. The skins are shaved down to the proper thickness; the long hairs are carded out by hand, the skins are rendered pliable by working with grease, and after careful drying they are ready for the delicate finishing touch of dyeing. In this process a large number of coats have to be applied by hand and with a brush before they are in proper condition. It is not surprising, considering the difficulty of preparation and the remoteness of

the points at which the skins are obtainable, that their market value should be considerable.

Mr. Elliott estimates that the enormous number of 180,000 seals may be annually killed at the Pribilof Islands without danger of depleting the original stock. This will be more readily apparent if I may be allowed to add a few figures from his report, previously referred to. After a careful computation of the area of the breeding grounds, and then assuming a certain space to be required for each seal, with which the whole space is densely packed, he arrives at the conclusion that approximately 4,700,000 seals are present at these "rookeries" during the breeding season.

This species, being much affected by the slightest degree of heat, is never found far to the South—their favorite home, as before stated, being the Sea of Kamtschatka.

The Southern fur seal (*Arctocephalus falklandicus*) closely allied in structure, and not differing appreciably in habits, occupies the corresponding latitudes in the Southern Hemisphere, being found in enormous numbers at the South Shetland and Falkland Islands.

Another well-known eared seal is the sea-lion of the North Pacific (*Eumetopias stelleri*). Many readers will remember seeing in the government building at the Centennial Exposition the stuffed skin of an enormous male of this species which in life must have weighed not far from twenty-five hundred pounds.

The Northern Sea Lion has all the characteristic marks of the *Otaridae*, but may be distinguished from all but *Otaria* by the enormous size of the male and the coarseness of its hair, which grows about the lower neck and shoulders to a length of several inches, giving to these parts the appearance of being developed even beyond the bulk usually attained in all these seals. These animals are found all along the Pacific coast from Middle California northward even as far as the breeding grounds of the fur seal in Alaska, and in lesser numbers exist on the northeastern shores of Asia. They are very numerous about the Bay of San Francisco—the celebrated colony on Seal Rock in that harbor belonging to this species.

The bull sea-lion is a savage and dangerous animal when enraged, and encounters have frequently resulted disastrously to an attacking party.

Capt. J. H. Vincent of San Francisco, who has been largely engaged in killing these animals for the oil which they yield, gave, recently, to the writer a description of a sea-lion hunt which took place during the past summer, in which one of his men was seized by a large bull, and so dreadfully mangled that he very shortly died. I have in my possession the skull of a large male killed by this party at the Farallone Islands, which measures 14 inches in extreme length, from the base to the extremity of the pre-maxilla, and 7.4 inches in width between zygomatics. The canine teeth in this skull were enormously developed, one which is before me now measuring 1.6 inches in length from edge of socket to tip, and 2.9 inches in circumference at base where it issues from the alveolus.

By way of contrasting the size of the male and female of these animals, I give also the corresponding measurements taken from the skull of a fully adult and unusually large female of the same species—extreme length of skull 11.8 inches; width between zygomatics 6.8; length of canines 1.1; circumference of canines 1.6 inches.

The whole appearance of the two skulls is very suggestive of the vast difference in physical development between the sexes; in the males the ridges for the attachment of the muscles having an enormous development, while in the female they are barely noticeable—this being in perfect accord with the mass of evidence which has been adduced by Mr. Darwin and others in support of the law that the sexual characters are developed to the greatest degree in those species which are most polygamous in habit. This is nowhere better shown than in those seals which come under this head, in which the males of some species, besides other differences, outweigh the female sometimes in the proportion of 5 or 6 to 1, and in one of which species (*Callorhinus ursinus*), perhaps the most polygamous of all, an old bull has been seen guarding a household of forty-five cows. The dentition of *Eumetopias* consists of ten molars, two canines and six incisors in the upper, and the same, with one less pair of incisors, in the lower jaw. The last or hinder pair of molars above, being separated by a space of about three-quarters of an inch from the next pair. The molars are sharply-pointed and are well fitted for tearing the fish which forms the diet of the animal. The outer pair of incisors much resemble the canines, but are somewhat smaller.

The sea lion of the South Pacific (*Otaria jubata*) was long considered as identical with the above, but the possession of six molars instead of five in the upper jaw, has been considered fully warrant its generic separation.

The sea lions differ little in their ways of life from the fur seals.

The main points of difference between Gillespie's Hair Seal (*Zalophus gillespi*) and *Eumetopias*, its near neighbor on the coast of California, are its smaller size, the absence of the so-called mane, and in some minor osteological characters; otherwise there is much resemblance between them; and this species too is often known by the name of sea lion. A number of them have been kept both at the Central Park Menagerie and the Philadelphia Zoological Garden, where they have always proved universal favorites; their graceful appearance, the rich brown color of their coats as they shoot dripping from the water on to the rocky edge of their pond, and the lig-

ring-like rapidly with which they dash through the water to seize the fish thrown to them by their keeper, all combine to make them among the most attractive of the inhabitants of the garden. They live wholly on fish, a nearly grown male consuming about fifteen pounds a day. Fish up to the size of five or six pounds will be swallowed whole at a gulp. When one of greater size is given to them, it is curious to see it seized in the jaws and flapped violently from side to side on the surface of the water or against a rock until it is broken into pieces small enough to be swallowed. The bones of the fish are readily digested and removed when the digestive apparatus is in working order. The writer, however, some time since, in dissecting a seal which had been sick and had not eaten for some days before its death, found in its stomach a double handful of herring bones apparently uninjured.

This species appears to be more docile in disposition than the sea lion. Much, however, depends upon the individual, occasionally the males being savage and disposed to bite without any provocation.

The proportions of the skull in this species are somewhat narrower and lighter than in *Eumetopias*; the muzzle is more abruptly truncated in front and the sagittal crest is much higher, giving to the head a more rounded outline.

The dentition is the same, but the molars are all closely approximated, the spaces between the two hind pairs in the upper jaw being wanting.

The corresponding species of the southern seas (*Zalophus lobatus*) differs little from its northern congener—more in geographical distribution than in any thing else. It is mainly confined to the Australasian seas, *Zalophus*, as well as *Eumetopias* and *Otaria*, is found on both sides of the Pacific, north along the Japanese Islands and to the south in New Zealand and Australia, thus completing the analogy of the distribution of these seals in the opposing hemispheres.

The second group, *Phocidae*, is much more generally distributed over the waters of the globe than are the last; from the icy oceans of the circumpolar regions well down into the temperate zones they are common. They are much more plentiful, however, in the colder parts, and are found to the southward only during the winter.

They present at once obvious points of difference from the eared seals. Their structure, however, as their habits of life, is but a modification of the same plan.

The members of this large group touch both extremes of size known among the seals but with the exception of the enormous sea elephant—largest of all creatures inhabiting the water, except the whale, they are of medium or small size. It is not difficult to recognize the members of this family, the absence of the short, pointed ear of the *Otaridae*, which in them is replaced by an almost circular orifice capable of being closed at will, would serve at once to mark them even without other points of difference.

The fore extremities are placed further forward, and the neck thus appearing shorter, makes them look more rounded on the breast outline. The rear extremities are permanently attached in the line of the axis of the body, and not being articulated in such a manner as to admit of lateral extension to any degree, they are useless as supports to the weight of the body on land and serve little more than the purpose of the tail of the fish. It will thus be seen that the seals proper are much more strictly confined to the sea than their more quadrupedal cousins—in fact, they do little on land but drag themselves beyond the water's edge, where they lie and and bask in the sun until the rising tide floats them off again. With a few exceptions, they are monogamous; the young are born on shore, generally in some cave or cleft of rock not far from the water. Like the eared seals they are very gregarious and are seen by all Arctic voyagers in large numbers on the ice floes of that region. To the inhabitant of those inhospitable parts the value of the seal is altogether beyond computation. It furnishes him with oil for his light, blubber for his food, skins for his clothing, sinews for his cord and his thread, and bone for a vast number of his other necessities. The meat is very black and rank, and is said to be utterly unbearable to any palate but that of an Esquimaux. In Greenland, where a closer proximity to civilization has supplied some of the wants elsewhere ministered to by the seal, one of the ends to which the product of the animal is most generally applied is—as under our higher cultivation—the adornment and embellishment of women; that which we here admire as seal skin sashes, so becoming to their fair wearers, is equally admired and valued by the Greenlanders when made up by the mistress of his kyak and his hut into the shape of a pair of breeches to add to the attractions of her own fair person.

There are a large number of seals in this family, differing in size and color but in little else. The dental formula is generally—molars, 5-5 5-5; canines, 1-1 1-1; incisors, 3-2 3-2.

The Spotted or Common Seal (*Phoca vitulina*) is well known to most visitors to menageries or zoological gardens, and may be taken as a typical seal of this family. This species is more generally distributed than any of the others, being spread over all the seas bordering the northern part of Europe and America, ranging to the Channel Islands and the coast of France in the former and in the latter to Maine, and occasionally to Massachusetts.

The most striking member of this group is, however, the Elephant Seal or Sea Elephant (*Macrorhinus proboscideus*). This enormous animal, reaching, in the male, a length of from twenty-five to thirty feet and a circumference of as much as eighteen, ranges, according to Peron, who, in his *Voyages de Decouvertes aux Terres Australes*, has given a circumstantial account of this species under the name of

*phoque a trompe*, between the 35th and 55th degrees of south latitude, over almost all the islands of the Pacific from the Falklands and the Cape of Good Hope to Kerguelen's Land. This seal is characterized by some very marked peculiarities. The nose of the adult male, when at rest, presents nothing strikingly apart from that which the nose of a large seal should; but when he becomes excited in any way, from rage or hunger, or from the more tender emotion aroused at stated periods by the presence of the other sex, this feature swells and becomes elongated and extended into a sort of proboscis some eight or ten inches long, and bearing much the relation to the face that the trunk of the elephant does. This peculiarity has given rise to both the common and scientific designation of the animal. The female is smaller than the male, and is destitute of this remarkable appendage. They are polygamous and much resemble in habit the fur seal and sea lion. The young are produced on land, and when first born are about four or five feet long. By the end of the fourth year they have reached their extreme length, and subsequently devote their surplus physical energy to getting fat.

They make annual migrations northward in winter, and back toward the higher degrees of latitude as warm weather advances. They are limited in power of progression out of water—in this respect resembling the rest of the *Phocidae*. They vary from the typical dentition of the true seals, having four incisors instead of six in the upper jaw and only two in the lower.

The third and last family of the aquatic carnivores, the *Trichechidae*, contains but one member, the well known Walrus or Morse (*Trichechus rosmarus*). The enormous tusks which form so conspicuous a feature in the physiognomy of this species, result from the extreme development of the canine teeth in the upper jaw. These reach a length of eighteen or twenty inches, and are known to be sometimes present in the female.

Even if, contrary to the old belief, a few of this sex had not been seen with tusks, it would not be probable that they existed only in the male as sexual characters, for so far as is known the bulls are monogamous and have little use for such terrible weapons of defence.

The great weight of these tusks has given a decided character to the bones of the skull, the fore part of which has been built up into a strong convex mass of bone capable of bearing so great a strain.

The largest males are thirteen or fourteen feet long, and weigh perhaps two thousand pounds; the female is not much smaller. Although they inhabit the coldest regions toward the Poles, the hair is very scanty, what little there is being of a brownish color; the enormous masses of blubber which accumulate beneath the skin serve, without doubt, in place of an outer coat to keep them warm. Notwithstanding the bareness of their skin, they are much infested with parasites which cause them great uneasiness. Mr. R. Brown states that he has seen an old bull lying stretched out on the ice and covered with a flock of small birds, which were industriously engaged in picking off his tormentors, the old giant occasionally manifesting his huge enjoyment of the proceedings. For a long time there was a dispute in existence regarding the nature of the food of the walrus. It has now been well settled that it is purely carnivorous, consisting of blubber, fish and crustaceans. Mr. Bartlett, of the London Zoological Garden, further expresses his belief that the animal would take kindly to carrion, and thinks that in the animal economy of the Arctic seas it may perhaps play the part of hyæna.

The Walrus herds together in large flocks throughout the polar regions of Europe, Asia and America, remaining in the neighborhood of ice, and on our continent rarely going farther south than the Gulf of St. Lawrence and Behring's Straits. They lie out on the ice floes in the higher latitudes, where the young are born, about the month of June. They are clumsy and unwieldy both in the water and on land; on the ice they assist themselves partly by looking their tusks on some projection or crevice, and dragging their bulky bodies along.

They are very fearless, and will fight desperately in defence of one of their number if injured. Dr. Kane describes a battle which took place between a boat crew of his men and a herd of walrus, one of which they had wounded, in which the men barely escaped destruction.

Their economic value is not great, all of their products being more coarse than those obtained from other seals, and they are used by the Esquimaux only in those latitudes where little else can be procured, their range extending farther to the north than that of any other species of the marine carnivora.

A. E. BROWN.

—The *Sunbury Gazette* disclaims the misnaming of the grouse, erroneously imputed to it in a recent paragraph, and very justly trusts "that FOREST and STREAM will reverse its opinion as to 'the nonsense in the *Sunbury* paragraph,'" which, of course, we do!

—Four Laplanders and seven reindeer, brought from Kantokino, have arrived in London. The Laplanders, with their dogs, an Arctic fox, two sledges, a tent, a variety of dresses, and two of the reindeer, are located at the Westminster Aquarium. These four Laps are the first that have ever visited England. They are two men and two women, are cousins, and their ages from 19 to 21. They go through certain performances, such as catching the reindeer and harnessing it to a sledge, tent-building, thread-making and singing, to illustrate the simple kind of life they lead.

## NOTES ON ALBINOES.

BY J. H. SAGE.

PORTLAND, CONN.

Sept. 8. This afternoon I was fortunate enough to shoot a field sparrow, *Spizella pusilla*, in albinotic plumage, having the two middle tail feathers pure white, remainder of plumage normal. The bird was by the road side in company with a dozen of the same species. Soon after in a pasture lot I came upon a flock of perhaps 400 robins, (*Turdus migratorius*) one of which had a white tail feather, the contrast being very striking as the bird took flight. When looking in a chestnut tree for the robin, killed a male blue bird, *Sialia sialis*, having a portion of the back and sides of the neck and breast mottled with white.

Sept. 10. Received a pure albino red-winged blackbird, *Agelaius phoeniceus*, killed here to-day by Lucius Alger; the breast has a yellowish tinge and the lesser wing coverts show a tinge of scarlet. This afternoon saw a robin with several of the wing feathers white.

Sept. 21. This morning killed a partial albino field sparrow, *Spizella pusilla*, having two tail feathers, and a primary in each wing white.

Sept. 23. Saw a robin, *T. migratorius*, with the back and some of the wing feathers white; unfortunately the seedmen was not secured.

Oct. 9. While shooting to-day within the limits of this town, Mr. W. W. Coe killed two beautiful specimens of the yellow rail, *Porzana noveboracensis*. These birds are very rare, and are difficult to force from the ground without the aid of a good dog.

Oct. 20. Two young of the red squirrel, *Sciurus hudsonius*, pure white were taken to-day; they are nearly full grown, and have dark eyes. Dr. Wm. Wood, of East Windsor Hill, Conn., informs me that it is not uncommon for the young of the red squirrel to be white and turn red afterward. He has had them undergo the complete change when kept in a cage.

[The above extracts from Mr. Sage's note-book will be of interest to all collectors. This seems to be a good year for albinos, although we have heard of no one so fortunate as our correspondent. Mr. A. B. Covert writes us from Michigan that he has taken four albinos this fall, among them *Sitta carolinensis* and *Cyanura cristata*, and we have heard of others who have done almost equally well. One only capture in this line as yet, has been a robin, all white except the head, which is pale slate color.—Ed.]

DOMESTICATED WILD TURKEYS.—We saw at the Hoffman House, Broadway, on Monday night, a box of wild turkeys awaiting shipment by express to the parties to whom they were consigned. Although of wild stock they were in reality tame, having been domesticated by Chas. H. Reed, the proprietor of the Hoffman House, at his farm in Far Rockaway. They were beautiful birds of the real bronzetype, male and female, the gobblers having the lustre of plumage and the long patriarchal beard characteristic of the species. These birds come from stock procured in Minnesota, and are vouched for as being of the true type of wild turkey (*Meleagris gallopavo*). Mr. Reed has had very fair success in domesticating wild turkeys as well as ruffed grouse, quail and other fowl, his proclivities in this direction being well known among fanciers. He has recently sent four of these birds to Lord Stanley, in England. We do not at present recall to mind any other person so extensively engaged in propagating wild turkeys, excepting the Hon. J. D. Caton, of Ottawa, Ill., who has raised several hundred, some particulars of whose experiments and successes have already been published in this paper. By the way, Mr. Reed, who is a very active member of the Blooming Grove Park Association, has pledged himself to construct a drive around the whole circuit of Lake Giles, the beautiful body of water in the Park, near which the club-house of the association stands. The drive when completed will be nearly three miles long, the beauty and enjoyment of which will be enhanced throughout by the undulating surface of the land, with glimpses of prominent points, and the constant variety of scenery afforded as the drive approaches the lake or leads through the woods.

JUDGE EVERTS' MIGRATORY QUAIL HEARD FROM AGAIN.—We have received from a correspondent at Skutumpah Haven, Pa., information of a bevy of quail found by him thirty miles west of Harrisburg, and which from the description we infer to be a part of the migratory quail found in Vermont by Judge Everts. From our scanty information, not having ourselves seen the Messina bird, we are not confident of the identity, but have forwarded our correspondent's letter to Judge Everts.

We sincerely hope the birds may prove to be a part of the lot in question, as we especially desire evidence that the birds have not flown out to sea and been drowned, but that a portion still remain in the country.

AN INTERESTING QUESTION—Lakeville, Conn., Nov. 26.—I wish to ask through your columns if any of my brother sportsmen have noticed the same disparity in sex of ruffed grouse killed by them that I have? Last season, out of about 100 birds killed by myself and friends, but three were hens. This year, out of forty-one birds killed during a trip to Berkshire Co., Mass., three were hens; and of over a hundred killed since the opening of the season in this State but four hens were found in the lot. The majority of the birds have been old cocks, with a ruff as "big as a man's hand," and I have noticed several specimens in which the ruff was a golden bronze, merely tipped with black on the ends of the feathers. I should like to know if any one else has noticed so great a disproportion.

Have had bad luck with wild rice. Sowed a bushel, came up nicely, and muskrats ate it off close to the roots.

Yours truly,

W. H. WILLIAMS.

[Certainly this is a most interesting question, and if further investigation should prove it to be a fact that but few female grouse are killed, it would seem to account very well for the comparative abundance of the ruffed grouse in some localities where they are "hunted almost to death." The habits of the ruffed grouse are such as to insure an abundance of the birds as long as the hens are left unharmed, for there will always be males enough left over to accomplish fatherly duties for a

much greater number of females. We hope that other correspondents will give some attention to this matter, and will let us know the results of their inquiries.—Ed.]

**MORE BIRDS' NESTS IN EXTRAORDINARY PLACES.**—*St. John, N. B., Nov. 30.*—Under this head I beg to give you an account of two cases that came under my notice.

In the spring of 1859, a pair of robins took possession of one of the pigeon holes (i. e., a receptacle for papers, way-bills, etc.) of the guard's brake van on the Essendine and Stamford Railway, Rutland, England. Industrious the happy pair worked during the time that the van was at Essendine (for this van ran to and returned from Stamford three times a day, a distance of twenty-eight miles) until the nest was completed. The female laid five eggs, and incubation commenced. She was carried to and from Stamford some ten or twelve times; but this happy state of things was suddenly brought to an end by an ignorant Nottingham drummer trying to secure the little bird by putting his hat over the nest. Mrs. Robin could not brook this intrusion—the nest was forsaken.

Case 2. A pair of blue tits chose for their nesting-place a small cavity that had been caused by a little washing away of ballast under one of the rails of the Great Northern Railway, the depth of the cavity from the under side of rail being about five inches. The nest was completed, the young tits hatched and flew, they having had, in addition to the care of their mother, the careful guardianship of Weston, one of the brakemen. There were about twenty-five trains a day clattering over the rail.

If Mr. Frank Buckland would like to add the above cases to his category of extraordinary birds' nests, there are persons living in Stamford and Essendine who, I am sure, will corroborate the above.

Yours obediently,

TANTRAMAR.

**HABITS OF THE WHITE FISH.**—The following letter from Mr. Fred. Mather, who recently went to Germany and Prussia with fish from this country, will be read with interest by fish culturists:

BERLIN, NOV. 8, 1877.

My attention has just been called by Prof. Peters of the Museum of Natural History, of this city, to the fact that a newly discovered species of *Coregonus* (*C. generosus*) from Lake Constance, has, during the breeding season only, an elevation of the centre of each scale, presenting, when the back of the fish is held toward the person, an appearance of a series of ridges or stripes resembling the lateral line. Having never observed this, nor heard of it in America, I hasten to write that our fish culturists may, if not too late, observe if our own *C. albus* presents this remarkable change during the breeding season, and report for the benefit of natural history.

FRED. MATHER.

**ARRIVALS AT THE PHILADELPHIA ZOOLOGICAL GARDENS FOR WEEK ENDING TUESDAY, NOV. 27, 1877.**—Two opossums (*Didelphys virginiana*), presented; one Yemen sheep, born in garden.

For Week Ending Tuesday, Dec. 4, 1877.—One opossum (*Didelphys virginiana*), presented; one brown capuchin (*Cebus fustulatus*), purchased; three white rats (*Mus rattus var. albino*), presented; two guinea pigs (*Cavia caprera*), presented.

ARTHUR E. BROWN, Gen. Supt.

**RECENT ARRIVALS AT THE CINCINNATI ZOOLOGICAL GARDEN.**—Five English pheasants (*Phasianus colchicus*), purchased; one red-winged starling (*Agelaius phoeniceus*); twelve purple grackles (*Quercus vesicolor*), captured in garden; one weeper capuchin (*Cebus capucinus*); three rhesus monkeys (*Macacus erythraeus*); two pig-tailed monkeys (*Macacus nemestrinus*); seven Macaque monkeys (*Macacus cynomolgus*); two bonnet monkeys (*Macacus radiatus*), purchased; one diamond rattlesnake (*Crotalus adamanteus*), presented by Frank J. Thompson; two lions (*Felis leo*), born in garden; one woodcock (*Philohela minor*), presented by Master Frank Hitzler, city; one coot (*Tringa americana*), presented by C. Drury, city; one loon (*Columbyus torquatus*), presented by Eureka Stove Polish Company, Wooster, Ohio; one badger (*Taxidea americana*), presented by Mr. John Kyle, city.

FRANK J. THOMPSON, Acting Supt.

## SPLIT BAMBOO RODS.

To our customers and the public:—In reply to the damaging reports which have been circulated respecting the quality of our split bamboo rods, by "dealers" who are unable to compete with us at our reduced prices, we have issued a circular which we shall be pleased to mail to any address, proving the falsity of their assertions.

CONROY, BISSETT & MALLESON,  
Manufacturers, 65 Fulton Street, N. Y.

## Woodland, Farm and Garden.

THIS DEPARTMENT IS EDITED BY W. J. DAVIDSON, SEC. N. Y. HORTICULTURAL SOCIETY.

### MUSHROOMS AS FOOD.

11 PEMBERTON SQUARE, Boston, Mass.

EDITOR FOREST AND STREAM:

A medical gentleman of this city (a subscriber to your journal) has called my attention to the issue of Nov. 15, containing a communication on the above-mentioned topic. I am a professed fungus eater, using various species of toad-stools for food daily. I gather them fresh in summer, and dry my superfluous stock for winter use. This study has been a hobby for some years, and I am under obligations (often to total strangers) for specimens, for interesting items, as well as for information on cases of poisoning. The object of this letter is to commend your editorial comment on Mr. Garlick's "rule," which is safe for the student but dangerous for the public. Let me give a few reasons: 1. Most people do not know the taste of esculent fungus. They may therefore be struck by a novel—attracting them momentarily—flavor, the indulgence in which experiment will cost them life itself.

2. The lines of distinction between some varieties of fungi are so closely drawn that an amateur may easily cook three mushrooms, believing them identical. He "gobbles" (to quote Mr. Garlick) one to his delight. He swallows the third to his destruction. The fairy-ring Champignon (*Agaricus arvensis*) is very common, easily recognized, and of

rare excellence. But I have never received them gathered by friends without detecting specimens of totally different species. Yet these persons had been warned by me of the distinguishing marks of the esculent and the doubtful fungus.

3. The consequences of a mistake are so fatal that no one should presume to eat mushrooms unless they are willing to devote time enough to the study to insure perfect safety. I have in mind a case where three persons died a painful death, and, by the statement of the only survivor of the fatal meal, not more than two tablespoonfuls of the stew were eaten at the table. No antidote to fungus poison has ever been discovered.

4. Mr. Charles James Sprague (a Boston mycologist of rare attainments) assures me that he never allows any fungi eaten in his house (excepting the common mushroom), as he believes intermediate forms exist among Agarics which no expert can identify. Certainly there is no rule or test by which hurtful fungi can be divided either on paper or in practice from those that are useful for food.

While giving these cautions I also express the opinion that there is no excuse for the current ignorance on the subject, except in the fact that all mycologists pursue the useless phantom of identifying microscopic fungi; that the majority of toad-stools are just as safe esculents as the common mushroom. Further, I have tested, on my own stomach, perhaps a hundred varieties, some of which have been long considered poisons, and have never been deceived. Your readers can find Mr. Garlick's "rule" explained by me in the *Popular Science Monthly* for May, 1877. I hope it will be generally followed by those who may study and classify fungi, and thus new varieties introduced to the knowledge of the public, with their characters as properly vouched for as that of the *Agaricus campestris*. It would be a favor to me to know the particulars of the case of poisoning quoted by you, if any of your readers can give them.

JULIUS A. PALMER, JR.

## THE NEW YORK HORTICULTURAL SOCIETY.

**L**AST week we gave a memorandum of the officers of this society elected for the ensuing year. We would now call attention to a few facts embodied in the reports of the officers presented at their last monthly meeting. Holding a charter dated March, 1822, through lack of interest in horticultural matters, and probably scarcity of money, the society held its last exhibition in 1857, until two years ago an effort was made, principally by those in the trade, to resuscitate the society, and with what success, let these reports testify. The monthly meetings have been interesting and well attended. The three exhibitions given at Gilmore's Garden in May, June and September, of this year, not only proved the best ever held in New York, but by the large attendance and the great interest manifested in the various exhibits, showed that the combined efforts of the nursery men and florists were appreciated. According to the report of the executive committee, the amount paid for premiums and necessary expenses was \$4,223, leaving a balance in the treasury of \$400, which, considering that their income is altogether derived from the dues of members and the receipts of the exhibitions, is ample testimony to the careful and economical manner in which the affairs of the society have been conducted. Too much praise cannot be given to those gentlemen who exhibited such splendid groups of plants and cut flowers, while the florists of New York and Brooklyn vied with each other in sending such beautiful and elaborate designs in flowers, as made their table (more especially to the ladies) the centre of attraction and admiration. At the September exhibition the show of fruits and vegetables was the best ever placed before the public of New York, and we doubt not that the coming season will see still greater efforts put forth by the members and exhibitors to gratify the public taste still further in every respect, apart from the great moral influence which these exhibitions undoubtedly exert on the community at large. As the membership is only \$5 per year, for which a full equivalent is given in admission to the exhibitions alone, we would fully endorse this society in every way, and trust our readers will assist it by every means in their power, so as to give it a firm standing in our midst. The secretary, W. J. Davidson, Box 191, Brooklyn, N. Y., or any member of the society, will gladly receive applications for membership, or give any further particulars in their power.

—We have just received from Mr. Charles Krick, 1,101 Broadway, Brooklyn, a bunch of flowers of his new *Bouvardia elegans*, var. *Rosaline*. It is of a beautiful clear pink color, and the trusses of bloom are as large, while the individual flowers are larger than the type. We consider it a great acquisition to our stock of florists' flowers.

**NATIONAL TROTTERING ASSOCIATION.**—The annual meeting of the General Board of Appeals of the National Trotting Association adjourned on the 6th of Dec. after a laborious session of three days. Among the concluding proceedings was the election of Edwin Thorne, of Millbrook, N. Y., to be First Vice-President of the Association, in place of Hon. C. W. Hutchinson, of Utica, N. Y., resigned. Mr. Thorne was also appointed as Chairman of the Atlantic District Board.

**NOTICE TO SPORTSMEN.**—Having received so many communications asking us for information in regard to our six-section bamboo trout, black bass, grise and salmon rods, we have prepared a circular on the subject, which we shall take pleasure in forwarding to any address. We keep on hand all grades, the prices of which range from \$15 to \$150. We put our stamp only on the best, in order to protect our customers and our reputation, for we are unwilling to sell a poor rod with a false enamel (made by burning and staining to imitate the genuine article) without letting our customers know just what they are getting.

P. O. Box 1,294.—(Adv.) ABBEY & IMBRIE, 38 Malden Lane.

**A SERIAL HUNTING STORY.**—"Book, Bear and Buffalo; Or, Hunting from Lakes to Ocean," is the title of a serial hunting story by the well-known "Mnemosyne," which will be commenced in the Christmas number of the *Chicago Field*. Subscription, \$4 a year; \$3 for six months; \$1 for three months. Single copies, 10 cents. Address: Marsh & Co., Proprietors *Chicago Field*, 119 East Madison street, Chicago, Ill.

## The Kennel.

**TO CORRESPONDENTS.**—Those desiring us to prescribe for their dogs will please take note of and describe the following points in each animal:

1. Age. 2. Food and medicine given. 3. Appearance of the eye; of the coat; of the tongue and lips. 4. Any changes in the appearance of the body, as bloating, drawing in of the flanks, etc. 5. Breathing, the number of respirations per minute, and whether labored or not. 6. Condition of the bowels and secretions of the kidneys, color, etc. 7. Appetite; regular, variable, etc. 8. Temperature of the body as indicated by the bulb of the thermometer when placed between the body and the foreleg. 9. Give position of kennel and surroundings, outlook, contiguity to other buildings, and the uses of the latter. Also give any peculiarities of temperament, movements, etc., that may be noticed, signs of suffering, etc.

**THE SAINT LOUIS BENCH SHOW.**—Our Western friends are actively exerting themselves to make their St. Louis Bench Show one of the great canine events of the coming year. We understand that Mr. Frank Kavanagh, a leading member of the Carleton Club of England, will act as one of the judges. Mr. Kavanagh's thorough acquaintance with dogs was manifested at the bench show of the Westminster Club. The time for giving the show is well selected, and we are informed that breeders and owners of choice animals all over the country are anxious to take part in the exhibition. One feature of the show will be a display of guns and rifles, sent there by the leading manufacturers in the United States. In addition to the regular awards, a number of special prizes have been presented. Mr. T. A. Durgan, the silversmith, offers silver plate worth \$50. Messrs. Mermod, Jaccard & Co., the jewellers, have presented silver worth \$100. One member of the association gives silver cups valued at \$75. Messrs. Burrell, Comstock & Co., send a complete set of furniture. The Goodyear Rubber Co. give an entire rubber outfit. The St. Louis Book & News Co. present a complete set of current sporting literature, including *Hallock's Sporting Gazetteer*. A man with a good dog can win a dozen shirts—not for the dog, but for himself. Apparently there is a dog excitement at St. Louis, and the business has but fairly commenced.

It is very possible that the railroad and express companies will take half fares for the two and four legged visitors to and from St. Louis, for it happens that Mr. E. Hayden, so well known as the manager of the American Express Co., is president of the St. Louis Bench Show. The board of managers are already in communication with many English gentlemen owning fine breeds of animals, inviting them to St. Louis, and inducements are held out for them to bring on with them their choicest dogs. What is particularly wanted is a good collection of Skyes, Dandie Dinmonts and terriers. We would advise some of our Philadelphia friends to bring to the St. Louis Bench Show some of their pretty brutes. There is possibly a demand for good English setters in St. Louis, and we should think that dogs of approved race and well broken would find eager purchasers. Some two or three good stud dogs are badly wanted in Missouri. Perhaps it would be well if Mr. Llewellyn would think it worth his while to come in person with some of his choice animals. We have more than once heard that the sale of good dogs in St. Louis, and in the West generally would be an easy task. Mr. Smith, of Strathroy, would find it to his advantage to be present at St. Louis, as the well known reputation of his breed of dogs would assure him numerous sales. We repeat the names of the officers and board of managers, to whom all inquiries should be made. President, E. Hayden; Vice-Pres't, J. A. Wherry; Secretary, Jno. W. Munson; Treasurer, H. S. Brown. Board of managers—Messrs. E. C. Sterling, C. J. Clark and W. L. Scott.

**ST. LOUIS BENCH SHOW.**—M. Von Culin, of Delaware City, informs us that he will go to the St. Louis Show with a private car, and can take a few other dogs than his own, which will have the advantages of proper care en route.

**ECHO AT THE PHILADELPHIA DOG SHOW.**—We publish with pleasure the following communication from Mr. Colket in regard to his dog Echo. Though objecting to his size, we think a handsome built dog, with a finer head, we never saw. The only trouble would be, we are afraid, to feed him, if he eats in proportion to his size. As Echo is phenomenal in stature, we mentioned him as such. Nevertheless we do not fancy large dogs. As a type of the big pointer we would mention the Brack breed, which comes from Germany. Some years ago some of this strain were to be seen in New Jersey. Oversized animals for the field we do not incline to.

PHILADELPHIA, Dec. 8, 1877.

In your notice of the Philadelphia Dog Show you class Echo as among the Brobdingnagian brutes, who, if not fast, are close and steady plodders. I find there is a prejudice against large dogs, but have yet to find that Echo's size is against him in any way. Have hunted him with some very fast dogs, but he always found the most birds in a day's shooting. For nose and staunchness he has no superior, and while he is not a very fast dog, is faster than the average, and no plodder. Was sired by Wardlaw Reed's Sam, who won first prize at Nottingham, Birmingham and at the Crystal Palace, 1869, '70 and '71, and was said by Ldstone to be the largest and most beautiful setter in England.

Respectfully yours,

WM. W. COLKET.

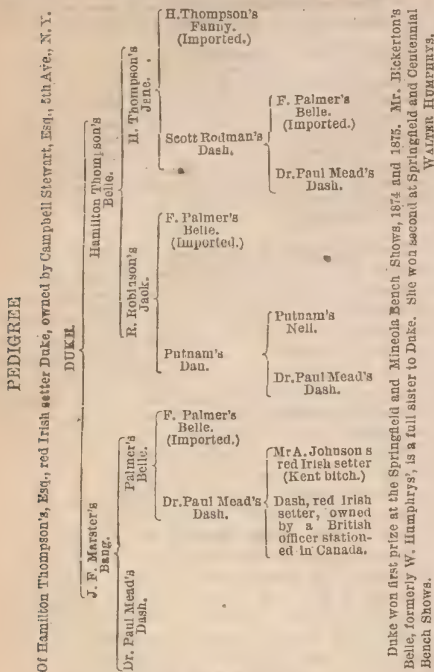

**LUMP ON THE SHOULDER.**—Mr. A. D. Boas kindly informs us of some cures made by him for dogs having lumps on their shoulders. Mr. Boas uses common black lubricating oil bathing and frictioning the lump with the oil.

—In our mention last week we should have said Mr. E. A. Spooner's Zos instead of Joe, as printed.

**DUKE'S PEDIGREE.**—*Mr. Editor:* Inasmuch as several gentlemen are at fault with regard to the pedigree of Thompson's "Duke," owing to certain inaccuracies in the pedigree as given in Mr. Burgess' American Kennel Book, I respectfully request you to print the following, which I vouch for as a true pedigree, having the original in my possession.

W. HUMPHREYS.

—Mr. Bickerton has sent his blood red Irish setter bitch, "Belle," formerly the property of W. Humphreys', to Dr. Jarvis, Esq., champion red Irish setter "Elcho."

—Mr. M. P. McKoon, of Franklin, Delaware County, N. Y., well known for his choice breed of cocker spaniels, has recently purchased, in order to improve yet more his already good stock, the well known "Mollie." "Mollie," who is a dark liver and white cocker, has the following distinguished lineage: Whelped, Oct. 14, 1875. "Mollie" is out of "Topsy," by "Dash," "Topsy" was imported via steamer Idaho, Sept., 1874. "Topsy" is out of "Flora," by "Wallace." "Wallace" is by "Rap" (well known in England as the champion Scarborough dog). "Flora" is by "Guess," the champion at the great Horton Show, June, 1875. "Dash" is by Crossland's "Duke" out of "Dora." "Duke" is by Findley's "Dart," imported May, 1869. "Dora" was imported by Corney in 1866.

**CURE FOR PILES.**—Harry McKenzie, of Boston, wishes us to state that he has tried all sorts of pile remedies without permanent benefit, with the exception of Leonard's Pile Ointment, which he maintains is infallible and permanent, and valuable alike for men and dogs. He disclaims any incenarary motive in recommending this ointment, not being even acquainted with the manufacturer. From the tone of our correspondent's letter we judge that he is wholly disinterested, and any service that may accrue from his efforts to benefit the suffering will no doubt be appreciated.

**THE WESTMINSTER KENNEL CLUB.**—The annual meeting of the Westminster Kennel Club was held on Friday evening last. The following officers were elected: President, Gen. Alexander S. Webb; Vice-President, C. De Bois Wagstaff; Secretary and Treasurer, Dr. William S. Webb; Board of Directors—Col. Legrand B. Cannon; Gen. Alexander S. Webb, C. De Bois Wagstaff, William M. Tileston, H. Walter Webb, William F. Morgan, Dr. W. S. Webb, George De Forest Grant, Frederick Barnard; Managers of the Bench Show—William M. Tileston, Dr. William S. Webb, C. De Bois Wagstaff, H. Walter Webb, George De Forest Grant. The next exhibition of dogs, held under the auspices of this club, will take place on the 16th and 19th of May, 1878, at Gilmore's Garden.

**THAT UGLY DOG.**—The dog which bore off the handsome goblet at the Nashville Exposition, offered as a special premium for the ugliest dog, has quite a remarkable history. He has been the guard at the jail for seven years, and during that time has not been outside the yard walls but three times, this being the longest time he was ever out. Though a remarkably ugly-looking dog, he is a thoroughbred, and one of the best watch dogs to be found anywhere. His master, Ambrose E. Camp, our worthy jailer, is proud and fond of him. He returned to his old quarters after the show, and the jail is safe. —*Louisville Poultry Journal.*

**CARING FOR A GOOD DOG.**—*Millerstown, Butler Co., Pa., Dec. 8, 1877.*—This place being on the oil belt, game is hunted very close; but by going away a few miles very good bags can be made. Three of us started out this morning, and by one o'clock had bagged thirteen quail, one partridge and one rabbit, when, unfortunately, one of the dogs was accidentally shot by one of the party. We then made a sling of a coat, and two of the party brought the dog home, a distance of five miles, while your humble servant carried three guns.

Truly yours,

J. A. W.

**CHARLESTON DOG SHOW.**—A bench show of dogs was held at Charleston, S. C., Dec. 10, 11 and 12. Among other notable dogs present were Gov. Hampton's Irish setters.

—T. Denmead, Jr., of Baltimore, claims the name of Spencer for his black and tan Gordon setter puppy, 6 mos. old, by Grand Duke II, prize winner at Baltimore Dog Show, out of Lucy. Lucy is by Mr. B. W. Jenkins, of this city; old dog Hero, out of same owner's Alice, both imported.

**FINE IMPORTED DOG FOR SALE.**—Last fall, when we were shooting around Brainerd, Minnesota, we had the good fortune to fall in with Capt. C. Messiter, an English sportsman, well known in America; who was going to Fargo, or farther West in quest of sharp-tail grouse. Now, on his return home to England, he proposes to dispose of his dogs, which accompanied him over his Western field. An advertisement of the same appearing in our last issue, Mr. Messiter writes to us personally:

I would not part with them had I any further use for them. One of them is own brother to a dog which has won several times at the Crystal Palace Show and elsewhere, and the other is also very well bred and capital in the field. They will back one another any distance and range well; have very good noses and seek dead, though they will not retrieve.

**THOMPSON'S "DUKE."**—We publish herewith the full pedigree of Hamilton Thompson's "Duke," at the request of a correspondent:

Duke—Red, born 1872, Hamilton Thompson, Jersey City. Prize winnings: First at Mineola, 1874, and first at Springfield, 1875:

| Thompson's Belle.      |                 |               | Bang.                    |                   |  |
|------------------------|-----------------|---------------|--------------------------|-------------------|--|
| Jane, Robinson's Jack. |                 |               | Belle, Paul Mead's Dash. |                   |  |
| Fanny Rodman's Dash.   | Gubner's Belle. | Putnam's Dan. | Palmer's Belle.          | Paul Mead's Dash. |  |

**LOST.**—A setter dog, liver colored and white, answering to the name of Don, was lost by Judge Gildersleeve, on Wednesday morning on the corner of Broadway and Chambers street. Any information regarding him will be thankfully received, and a suitable reward given on his return to owner at Court House, 32 Chambers St., or 23 W. Forty-eighth St., N. Y. H. A. GILDERSLEEVE.

## Game Bag and Gun.

### GAME NOW IN SEASON.

|   |  |
|---|--|
| Moose, <i>Alces melchis.</i>                        | Pinnated grouse or prairie chicken                 |
| Caribou, <i>Tarandus rangifer.</i>                  | <i>Cupidonia cupido.</i>                           |
| Elk or wapiti, <i>Cervus canadensis.</i>            | Ruffed grouse or pheasant, <i>Bonasa umbellus.</i> |
| Red or Virginia deer, <i>Capreolus virginianus.</i> | Quail or partridge, <i>Ortyx virginianus.</i>      |
| Squirrels, red, black and gray.                     | Woodcock, <i>Philohela minor.</i>                  |
| Hares, brown and gray.                              |  |
| Wild turkey, <i>Meleagris gallopavo.</i>            |  |

"Bay birds" generally, including various species of plover, sand piper, snipe, curlew, oyster-catcher, snipe, phalaropes, avocets etc., coming under the group *Limacola*, or Shore Birds.

**MASSACHUSETTS—Wareham, Dec. 4.**—Mr. Willard Lewis, of Rockland, built last summer a gunner's lodge on Bolens Point, eastern shore of Sampson's Lake, South Cove, some seven miles from this village. Having covered the structure with evergreen boughs, he took up his abode there with his wife. The success of the pair has been unparalleled in this country. Last Friday, the lord of the manor shot 30 wild geese; one day this week he secured 14, and the total of his bags is up among the hundreds.

One day last week Mr. Philander Bumpus, who lives on the shores of this lake, secured 6. In fact, there are a score or more shootists around this lake, who daily get a crack at the voyagers from Belle Isle, who are winding their way southward. This lake seems to be a chosen haven of rest for the poor goose; and this season, above all others, has proved to be the last resting-place of hundreds of the tribe, to the glorification of the pleasure seeker.

**Salem, Dec. 7.**—Sporting matters are running quiet in our section just at present. One thing let me say: I did not shoot the quail spoken of by "Staunch." I own the bird, and saw it shot, but Mr. R. K. Patch, of Hamilton, is the man who did take it, and to him belongs the honor.

**NEW YORK—Atlantideville, Dec. 8.**—Broadbills are here by thousands; ducking was never better. A favorite house for sportsmen here is that of B. F. Squires, who furnishes board for \$1.50 per day, and battery decoys, man and boat \$5 per day.

**South Bay, Long Island.**—Water fowl shooting on the South Bay, Long Island, was never better. The birds are present in large numbers, embracing brant, broadbill, sheldrake and numerous other representatives of the goose and duck tribe.

**Constantia, Dec. 8.**—A correspondent of the Central Square News says: "Sportsmen, both on the lake and in the woods, are having their hands full this season. The immense flocks of ducks now in the lake give the hunter an opportunity to show his prowess in being a good shot. From early dawn till dark the ducks are kept moving. Partridge shooting still continues good."

**Baldwinsville, Dec. 9.**—On Monday a gray eagle was shot, measuring 7 feet 6 inches across the wings; from tail to beak, 3 feet, and weighs fourteen pounds.

**Blomingsburg, Dec. 8.**—Still making fine bags of game. Partridges plenty; self and Miller last week killed 32 in three days' shooting, and one woodcock weighing nine ounces, a fine one. Shot a black snake on Dec. 4, and have had snow on the ground. Who ever heard of snakes at this time of the year?

**New Jersey—Harrison, Dec. 6.**—Cannot the game laws be made of some use? It seems they don't amount to anything. In the first place, game is allowed to be sold too long after the close season; thirty days after the close season is long enough to sell what game has been shot. By giving too long time it encourages the killing of game after the season. In Forrestburg and Sandbury, in Sullivan Co., N. Y., the pot-hunters have snared and trapped the partridges in large numbers. In Sandbury you can't find a partridge. H. E. R.

**PENNSYLVANIA—Haver, Dec. 6.**—The country around here formerly abounded in game of all the varieties usually

found in the Middle States, and bags of fifty and sixty quail per day were often made by two sportsmen in the years preceding the war, and in fact up to the winter of 1864, which winter proved particularly disastrous to quail. Still fresh in the mind of the writer is the result of one day's hunt, when 102 quail, besides several cotton tails, were emptied upon the bar of the Central Hotel, killed by Harry Kurtz and his friend P., of Baltimore; but, *tempora mutantur*, and now it is considered a good day's work to kill ten to twelve per day. I succeeded in bagging four quails and one rabbit on Thanksgiving Day, and nine quail on Saturday following, tramping over several townships, and missing only two birds in both days. The season ends December 15, and steps are already being taken by the sportsmen here to procure as many quail as possible to keep until the winter is over. Brush.

**Clearfield, Dec. 5.**—The local editor of the *Raftsmen's Journal*, with a party of friends, have been deer hunting on the mountains. Sam Bell, of West Clearfield, killed a fine doe last week. The *Journal* says: "Of late there has been a very extensive pigeon roost in the northern part of Clarion county, near Newmarville. But owing to the continual shooting by the sportsmen the birds are exceedingly shy, though quite a number have been killed. Is it a mere coincidence that eight years ago and sixteen years ago there were similar roosts in the same neighborhood?"

**Warrington, Dec. 8.**—Turkeys, partridges and hares—thanks to statute law—have been exceptionally plentiful this season. One gentleman (Mr. J. K. M.), who delights in the dog and gun, in fifteen days bagged 242 partridges. In one day he killed 44 partridges, 1 pheasant and 3 hares. We presume he heads the list of amateurs.

**Greenville, Dec. 10.**—The Greenville shooting party, who are deer hunting in Osceola county, Mich., write to the *Argus* that they have killed fourteen deer. They break camp to-day.

**VIRGINIA—Leeburg, Dec. 5.**—During last four or five days four gunners have averaged about 16 quail apiece each day out. One gentleman killed 4 pheasants (grouse) in about an hour and a half near town. Weather warm and rainy.

T. W.

**SOUTH CAROLINA—Charleston, Dec. 8.**—Both deer and turkey have been received in large quantities here this week, especially deer; some sixty odd having been received by private parties and at our public market. The last cold snap has being had along the coast, and on the rice plantation over one hundred pair were brought in by last Pee Dee steamer.

YENOTS.

**FLORIDA—De Soto Grove, Banana River, Nov. 27.**—Deer plenty; ducks in any quantity, but are little hunted on this side as there are more or less deer here at all times of the year.

MOORE.

**MISSISSIPPI—Corinth, Dec. 8.**—I fear that there are very few quails, though I wrote you early in the season that they were seemingly plentiful. Subsequent observation has convinced me that I was then mistaken.

GUYON.

**TEXAS—Galveston, Nov. 30.**—Ducks and geese are plentiful. The coast of Texas presents just now the best ducking grounds to be found.

**WISCONSIN—Menasha, Dec. 3.**—Fall shooting not as good as usual; ducks and wild fowl scarce; the deer are in great plenty about 30 miles north of us.

S. L. H.

**OUR REGISTER.**—S. B. Dodge, Esq., of New York, sails this week for Florida, and will make his headquarters at Chrysal River. Mr. Dodge will be absent some four months, and would be glad to have the company of some gentlemen. As it is a country abounding with game Mr. Dodge expects plenty of fishing and shooting.

**THAT PUZZLE.**—Well, sportsmen are strong in mathematics. That fact is conclusively proved by the letters which come pouring in in response to the problem published last week. And not only do our correspondents send correct replies, but, like Oliver Twist, they call for more. The boy's game consisted of five woodcock, which cost him fifty shells, forty-eight blackbirds which cost him three shells, and forty-seven squirrels which cost him forty-seven shells; total, one hundred birds for one hundred shells. Now, who can complain of the high price of woodcock in our market?

**CAPT. BOGARDUS AT THE OLYMPIC.**—For a debut without stage fright, this famous marksman made an excellent appearance on Monday night last at the Olympic Theatre. The Captain first had ten balls sprung in different directions, and broke every one. He then fired at eleven with a pistol, missing all but three, upon which the Captain remarked, "That he was not boss with the pistol, but was with the shot-gun." He then broke sixteen balls in one minute. On Tuesday last he broke thirty balls straight, making no misses.

## WHO IS R. WAKEFIELD?

MONTBEAL, CAN.

EDITOR FOREST AND STREAM AND ROD AND GUN:

The above question was asked by one of your correspondents at Whitehall, in your issue of October 4, and you gave a very correct reply. "R. Wakefield" is the trade mark I put on guns of English manufacture, and this, in conjunction with the Lion and Beaver and the monogram RHK between them, is registered at Stationer's Hall, London, England, and can only be used by myself.

Craving your polite indulgence, I now ask you to permit me, through your columns, to state by what motives I was actuated in adopting any name as a trade mark, which was not my own. I don't make guns; I profess to be the architect, but not the builder.

My guns are constructed after my own designs, and I employ builders, who will furnish the best work at the most reasonable price. Makers who are both the architects and builders of their guns, and who have deservedly earned an enviable reputation, may sometimes yield to the temptation of trading on their fame; and this either furnish an article of mediocre merits at a price beyond its real value, or a really good article at a fancy price.

My motives then are—1. Not to be identified with, or tied to, any maker; 2. To be entirely independent of fancy prices; 3. To secure the best work at the lowest figures; 4. To employ such builders as are best calculated to satisfactorily construct the various classes of guns suited to all the wants of my correspondents.

I hope your readers will have charity enough to refrain from saying that I must be some relative of the famous Captain Bragg, if I assert that I understand what a gun should be. I have handled a gun ever since I had strength sufficient to carry one, and I hardly like to confess how many years that is since. Thus, you will see, I do not labor to con-

## A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INDOCTRINATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY:

PUBLISHED BY

**Forest and Stream Publishing Company.**

—AT—

No. 111 (old No. 103) FULTON STREET, NEW YORK.  
[POST OFFICE BOX 2892.]

TERMS, FOUR DOLLARS A YEAR, STRICTLY IN ADVANCE.

Twenty-five per cent. off for Clubs of Three or more.

### Advertising Rates.

Inside pages, nonpareil type, 25 cents per line; outside page, 40 cents. Special rates for three, six and twelve months. Notices in editorial columns, 50 cents per line.

Advertisements should be sent in by Saturday of each week, if possible.

All transient advertisements must be accompanied with the money or they will not be inserted.

No advertisement or business notice of an immoral character will be received on any terms.

\* Any publisher inserting our prospectus as above one time, with brief editorial notice calling attention thereto, and sending marked copy to us, will receive the FOREST AND STREAM for one year.

NEW YORK, THURSDAY, DECEMBER 13, 1877.

## To Correspondents.

All communications whatever, intended for publication, must be accompanied with real name of the writer as a guaranty of good faith, and be addressed to the FOREST AND STREAM PUBLISHING COMPANY. Names will not be published if objection be made. No anonymous contributions will be regarded.

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions.

Nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for dereliction of the mail service if money remitted to us is lost. NO PERSON WHATSOEVER is authorized to collect money for us unless he can show authentic credentials from one of the undersigned. We have no Philadelphia agent.

Trade supplied by American News Company.

CHARLES HALLOCK, Editor.

T. C. BANKS, Business Manager. S. H. TURRILL, Chicago, Western Manager.

## TO GERMAN RIFLEMEN.

Desirous of increasing the interest among our numerous German friends in regard to rifle shooting, the FOREST AND STREAM AND ROD AND GUN will present to the best team of twelve—a team to be composed of active members of some shooting club—a gold medal, to be called "THE FOREST AND STREAM AND ROD AND GUN PRIZE MEDAL." The rules and regulations governing this match will be found in their appropriate place in our rifle columns. Entries may be made at the office of this journal on or before January 20, 1878.

As a great many of the leading riflemen of our N. R. A. of America are Germans, and as their school of arms was commenced under German auspices, we may venture to express the belief that the contest will be a spirited one, and likely to bring out the best shots in the country. The design for the gold medal is now in the artist's hands, and we will, as soon as practicable, have an engraving of the "FOREST AND STREAM AND ROD AND GUN MEDAL" produced in our columns. That spirited rivalry, which has lately existed between two famous clubs, may find in this medal a new source of friendly contest.

THE POST AND STATION SYSTEM OF FINLAND.—In a recent issue of FOREST AND STREAM we published an article from a prominent American resident at St. Petersburg, Russia, which introduced some reference to the post and station system of Finland, very generally correct in its statements, though not so fully so as to escape the attention of Mme. Selma Borg, the eminent lecturer and vocalist, who being a native of the country, has had the best opportunity to be well informed of the facts. We quote the subjoined extract from this lady's letter:

ACADEMY OF MUSIC, Philadelphia, Dec. 1, 1877.

Finland suffers under many heavy burdens, inevitable to a subjected country; among these the "Post and Station" system is one. Owing to the tardiness on the part of the Russian Government to keep its word and grant Finland its lawful representation by Diet, this system still exists, until the railroads now in operation, and others projected, shall partly do away with it, as the steamboat traffic already partly has done. Imagine the farmer obliged to pay a tax in form of regular provision of horses and men for the posts and for travelers. This pay is not worth mentioning, it is merely nominal; and thus these peasants sustain travel and the post for all who please to come and go at their expense. For that is what our post station system in Finland amounts to.

SELMA BORG.

## VACATION RAMBLES IN MICHIGAN, WISCONSIN AND MINNESOTA.—No. 7.

BY THE EDITOR.

DECEMBER 13, 1877.

GENTLEMEN: I have said several times that for travellers not pushed by stress of business, which vacation tourists are never presumed to be, the journey from Grand Rapids, Michigan, to Milwaukee, Wisconsin, is far more enjoyable by steamer than by rail. Jotting down incidentally in my last letter a few of the objects of interest to be seen in the forty miles' run by rail from Grand Rapids to Grand Haven, you will remember that I had placed myself and luggage on board the Transportation Company's huge steamer Amazon, and steamed out of port upon the broad waters of the lake. It was midnight and calm. All on board were in repose, except the watchers and the ponderous machinery. The motion of the great engine was almost noiseless; its pulsations and deep breathings came so regularly that it seemed asleep, but active, like some giant somnambulist with his functions in full but unconscious play. And all the passengers slept on securely without apprehended gale or fear of hidden shoals, and enjoyed their undisturbed rest until the morning twilight dawned. With its first gray, and afar out at sea, came little buntings, sparrows and warblers circling about the vessel, perching upon the rigging and hopping about the deck. Good luck to seamen do these feathered attendants always bring, and the woes of the Ancient Mariner certainly await the unhappy man who wantonly harms a filament of their innocent heads. So the sailors say. Presently the sky began to redden in the east, and the watery horizon grew lurid; and out of his bed of crimson and yellow, beside the limpid lake, Pœbus arose, and all the surrounding water was irradiated. All ruddy and aglow from his early bath, he set forth on his daily round, warming to his work like a lusty pedestrian, and making a straight push for Milwaukee, where he arrived at 9 A. M., beating the Amazon by an hour!

Long before we reached the port, the white walls of the beautiful city could be seen gleaming in the sun, one-half resting like Venice on the sea, the other apparently rising in terraces up to the crown of a cliff, where spires, domes and broken ranges of buildings gave charming effect by the variety and beauty of their outlines. As we near the shore, the vessel enters a belt of discolored water which the eye can follow into the embrace of two parallel piers, whose ends are guarded by twin lighthouses. This is the debouchure of the Wisconsin River, tinged and saturated with the dyes of hemlock, spruce and tamarack, that grow in the swamps and ridges of the "Big Woods," hundreds of miles inland, whither we are bound. Its coffee-colored path is as distinct from the clear green of the lakes as the milky way is from the blue of the heavens. If not a path of light, however, it is a path of abundant commerce and a royal road to wealth, leading right into the heart of the city like the great arterial channel which it is, whose pulsations are felt to the extremities of the continent. Great warehouses enclose the huge steamers as they lie at the wharves, stuffing them with cereals of all kinds with the merciless tenderness of assiduous nurses, until distended satiety creates glut in the market, and excess of production returns to plague imprudence. Milwaukee's purse is most always full. Like the beak of an octopus, it lies in its central portion, which is splendid with edifices of cream-colored brick and variegated stone, and empties itself into the spacious suburbs, where its retired millionaires and well-to-do merchants live sumptuously, but not ostentatiously, surrounded by shrubbery, flowers and embellishments, numerous, natural and artificial. The private residences of Milwaukee are certainly most attractive. They are chiefly found upon three or four avenues, the principal one bordering the lake, along which there is a superb drive over a macadamized road, with pleasant places of resort for visitors along the route. My friends of the rifle club drove me over as much of the city as my short visit would permit, and seemed to be pleased with the happiness I enjoyed. They were glad because I was glad, and I was glad that they were glad that I was glad. So we were all glad.

The members of the Milwaukee Rifle Club comprise some of the best sharpshooters in America, whose scores are already recorded. They are emulous rivals especially of the Rifle Club of Chicago with whom they have frequent trials of skill and interchanges of social courtesy. Their range is admirably adapted for practice and replete with comfort and convenience for contestants. There is also a pleasant park near the city for pigeon contests. I will say nothing in fulsome adulation of Milwaukee or her citizens, but I can say truthfully that she deserves her title of "Queen City of the West." I would have tarried longer within her hospitable and tree-embowered precincts, but my friends Pratt and Phillips of the West Wisconsin Railroad, were telegraphing me from the Chequamegon House at Ashland, to come up to Lake Superior before the trout season closed. So I bade adieu to valued friends, promising to return. That promise, however, lies tabled for next year.

Twenty years ago I spent a considerable time in the western portion of that section of Wisconsin which has since been penetrated by the West Wisconsin Railroad, which crosses the State from east to west near its middle line. Until last summer this was the frontier railroad; little but forest lay to the north of it. Through that forest clear streams of delightful coldness flowed, and it was no task to take trout out by the hundreds for each day's fishing. Neither was it an

isolated case to be interviewed by a bear while wading a stream with my rod. The brutes would come down to the water side to drink in the mid-day heat. Deer were most abundant, and old Starkweather, the hunter, whom I mentioned in my "Fishing Tourist" as having met while he had his cabin in Potter County, Pa., used to say that he believed there were two hundred bear and five hundred deer within a radius of five miles from his cabin on the "Menomene." That was a great country for pelts in those days. Starkweather moved out there because he was crowded out from Potter County; but now it is more settled and civilized around the Menomene than Potter County ever was. Perhaps it was curiosity to see what was to be found in the unbroken forests beyond and to the northward of so generous a region that induced the projectors of the Wisconsin Central Railroad to push their line into its territory. For many years a railroad had been in operation from Milwaukee to Stevens Point, a busy, thriving lumber *entrepot* on the very frontier of civilization. Along its route were many flourishing cities and towns, and the daily trains rumbled along the shore of pleasant Lake Winnebago with its many lacustrine villages, penetrating into the interior, and picking up business here and there at numerous way stations until, as we have said, they halted at Stevens Point, 165 miles northwest of Milwaukee. This was the *ultima thule*, as St. Louis was once; and here, just as there, trappers and Indians brought in their pelts, and outfitted again for the woods. Great drives of logs came down from the upper waters of the Wisconsin and the humble houses of the employees clustered around the many mills that whipped the logs into lumber with mechanical celerity. Lodging houses and grogeries were numerous, and the din of fiddling and double shuffles was heard in the pipe-beleaguered and smoke-stained rooms. Not altogether changed is Stevens Point of to-day, for it was only on the 1st of July, 1877, that passenger trains, with their motley complement of prospectors, homesteaders and sightseers, reconnoitered into the wilderness beyond. But Stevens Point is no longer the frontier. The frontier now lies on the romantic shores of Lake Superior, and a goodly line of settlements has sprung up all along the intermediate route. The railroad schedule indicates no less than twenty-four towns between the two termini, which are 186 miles apart, making the entire distance from Milwaukee to Ashland 351 miles. These twenty-four towns no doubt have a future. Some of them have no present.

Several are represented by a row of one and two-story frame buildings, which were grogeries in full swing when the road was being constructed, but are now deserted. There is not a germ of life or growth in them. Frequently, a lumber mill, with its surrounding cabins and store, has already formed the nucleus of a considerable community. There are a few clearings that promise to be goodly farms. Two or three towns already have populations of a couple of hundred or so. Comparatively speaking, much has been done; the resources that have been already developed are sufficient to invite the attention of immigrants, and give encouragement of a rapid future settlement. But the whole country is new, and therefore offers to the sportsman and tourist novelties of experience and sight-seeing that he will not find on older roads. Halting at most any given station along the route, it would not be difficult for a good woodsman to secure a bear or deer at short notice. There are many lakes and streams which afford good fishing. Beyond the town of Phillips the entire route is through a succession of swamps and forests of primitive growth. Piles of bark are encountered at intervals; huge logs recently cut have been hauled out to the roadside; pelts of coons, bears and wildcats are stretched upon the sides of the cabins; Indian hunters stand statue-like on the edge of the forest and peer at the train as it passes; an occasional hound or well-made pointer or setter indicates some interest in sport. But for the loss of voluminous notes and memoranda, I could specify many localities by name which invite the attention of the angler and gunner. Of birds there are pigeons and ruffed grouse in abundance. Butternut Creek, which connects two lakes filled with large pike and muscalonge, is a favorite resort for the guests at Ashland. It is fifty-four miles distant. One can go down in the morning of one day and return on the evening of the next, finding tolerable lodgings in a frame-house at the creek. As I passed through, a business car stood on a siding, which had been chartered by a Chicago party who were fishing in the lakes. This car afforded every convenience for camping. Between Butternut Creek and Ashland are some expensive iron bridges, and much labor has been expended upon the road-bed. In this region are many fine trout streams, as well as waters that abound in muscalonge, bass, pike and perch.

The attractions of Ashland and vicinity more than compensate for the tedium of what would otherwise seem a long and monotonous journey. It is a relief to emerge from the gloom and tangle of the sombre forests into the open fields and pleasant lines of houses that border the broad Chequamegon Bay. A modern omnibus takes the tired traveler from the station to an inviting hotel of modern construction, whose broad piazzas overlook the bay. Spacious rooms invite rest, and an abundant table is provided for the wayfarer. In the uncertain light of the fading day we can scarcely discern the surroundings, but we feel that they are pleasant; and so we retire for the night, with feelings that our anticipations are to be satisfied, and that the coming day will fulfill the promises that have been held out to us.

I leave for a subsequent letter some description of the sport that can be found at this new and really charming summer resort.

HALLOCK.

**AQUARIUM—THE MISSING LINK.**—The enterprising managers of the Aquarium have added a new attraction to their exhibition. They have secured the service of the Missing Link, whatever that may be. This Link is a huge stone semblance of a man, which comes from Colorado, not unlike in contour of head to some of the Egyptian figures. Without going into the exact measurements of the head, we may declare that the Link has a tail some five inches long. Sculptors who have examined this strange figure declare that the proportions are quite perfect, that is, as far as they (the sculptors) may have acquaintance with the prehistoric man. Darwinists are in ecstasies of delight at the positive and undisputable evidences of a tail. Some time or other, say a myriad of years before this figure was made, perhaps man enjoyed a much larger tail, with which he swung himself about from tree to tree. Of course individuals so blessed, when they were forced to sit down had to carry with them a little bench with a hole cut in it, so that all might be snug and comfortable. If the Niams-Niams are said to have elongations of the spine, why may not the present figure represent past development? It may be remembered that in an early volume of the *FOREST AND STREAM* the existence of a negro woman with such a caudal embellishment was stated, and the source from whence the information was derived could not be doubted. The only thing which we may be skeptical about in this figure, is whether it be the petrification of a human being. That is a conclusion which we see no reason to accept. That it may be the representation of a figure or deity fashioned by some race long past away is the more probable solution of this question.

## GAME PROTECTION.

—The New York Association for the Protection of Game and Fish inaugurated its winter series of monthly meetings last Monday evening at the residence of its President, Clinton Gilbert, Esq., No. 20 West 10th street. There was a fair average attendance, but the amount of business brought before the society was not great, considering the long interval since its previous regular meeting in April. The Secretary reported progress on suits brought by it against violators of the game laws. A letter from W. S. Blunt set forth that the unlawful shooting of game and song birds is being extensively practiced in the vicinity of Bay Ridge, L. I., the remedy for which is fully provided for in the statute. Mr. Everts' experiment in introducing migratory quail was reviewed and commended, and success wished to his undertaking.

**THE EXPORTATION OF QUAIL FROM NORTH CAROLINA.**—As many persons are sending to North Carolina for quail (partridges) we publish an act of the General Assembly of that State prohibiting the exportation of these birds:

**CHAPTER CXCV.**—Whereas, As observation and experience in other sections of our country have shown that the insect-destroying birds afford material protection to grain crops; and whereas, the exportation of quails or partridges from the tier of counties along our railroad lines is likely to exterminate that beautiful and useful species of birds, therefore,

**SECTION 1.** The General Assembly of North Carolina do enact. It shall be unlawful for any person or persons to export from the counties of Catawba, Rowan, Guilford, Alamance, Rockingham, Orange, Iredell, Davie, Gaston, Columbus, Davidson, Anson and Forsyth any quails or partridges, either dead or alive.

**Sec. 2.** Any person violating the provisions of this act shall be guilty of a misdemeanor, and upon conviction thereof before any Justice of the Peace, shall be fined not exceeding fifty dollars nor imprisoned more than thirty days for each offence.

**Sec. 3.** This act shall be in force from and after its ratification.

Ratified the 6th day of March A. D. 1877.

**UNLAWFUL SHIPMENT OF GAME TO ENGLAND.**—We invite the attention of our local clubs and also of those in the West to the subjoined communication of our correspondent E. H. The subject should receive investigation and prompt action:

I wish to call the attention of American sportsmen to the fact, which came under my personal observation, that thousands of prairie hens, and also a large number of American quails, were sold in the poultryers' shops in London and in other large towns in England this year during the months of February, March and April, and as late as the middle of May. The birds are sent monthly in barrels, are generally in prime condition, and retail at from two to three shillings each (fifty to seventy-five cents). It would be an easy task to find the shippers of the birds so that they could be made examples of. Let the Sportsmen's Clubs of the Western States keep a sharp lookout for the offenders. I trust that this warning may open the eyes of American sportsmen to this wholesale violation of the game laws of every State in the Union.

## FOR THE PROTECTION OF FISH IN THE PROXIMITY OF NEW YORK.

We publish the following circular, issued by the Excelsior and Walton Fishing Clubs:

To the People of Richmond County:

The time was when the anglers of New York and New Jersey came to your shores to fish, knowing that they would not be disappointed; but of late years they have spent their money among you and returned empty-handed. Without encouragement they will not come again. New York Bay and the Hudson River, Raritan Bay and the Raritan River, were formerly swarmed with fish. These rivers and bays, and the neighboring estuaries of the sea, are the running and spawning grounds of sea fish, from the diminutive porgy to the lordly salmon. Along the different lanes, and to the little brooks and cranies of the bottom of these waters, came all the edible fish familiar to us, each year, with the advent of spring, to increase and multiply, and to return the year following, young and old. Then, he who angled for pleasure, and he who angled for profit, and he who angled for his daily meal, each found rich return. All this may again be. About thirty years ago the first pound net ever used was set upon the

shores of Long Island. These nets have gradually increased in number, and the supply of fish has as steadily decreased, until now pounds are to be found everywhere, and the angler for sport and the angler for food each spends his time for naught. The Commissioners of Fisheries, in their reports to the Legislature, severely condemn the use of pounds. In their report for 1870 they state that *pound nets exhaust the waters in three years*; that they are generally owned by men of means, who know by experience that at the end of three years they can get no more fish in the locality that they have occupied; they thereupon sell their nets at a reduced price to poor fishermen, and are willing to accept a mortgage in part payment; but the nets are old and worn, the fishing is destroyed, and bankruptcy comes upon the deluded purchasers. They state that the Canadian Government has been compelled to prohibit the use of pounds on the northern shore of Lake Ontario. In their report, dated Feb. 1, 1875, they use the following language:

The destruction wrought by pound nets has been apparent wherever they have been introduced. By their use our larger lakes even have been depopulated of the myriads of fish which once inhabited them. \* \* \* Even the ocean itself cannot meet the ravages it (pound-net fishing) causes, and wherever pound-nets are established the inevitable consequences follow in but a few short seasons. In Canada, where special pains have been taken to restore the salmon fisheries, they have been utterly prohibited, and if we would save our fisheries we must follow this lead. \* \* \* The natural yield of wood- and waters in game and fish is a heritage of the whole people, and ought not to be appropriated by any set of individuals. \* \* \*

Machines invented to carry on a trade which is deleterious to the community are never sacred, and money so invested has no security except in the long suffering of a patient and sorely tried public. \* \* \* None (fish) escape but the very few who follow the exact centre of the channel. \* \* \* Enough are left to keep up the breed; the habits of spawning are directly interfered with, the fishing begins to deteriorate. It never lasts but a few years, and at the close leaves that entire section of water absolutely bare of fish, dependent upon accident or the laborious efforts of man for its possible restoration.

Again, in the same report, they say that fish have spots that they frequent, and when a locality is once stripped of fish it remains barren for a long time.

Hence the destructiveness of pounds. Where only a few fish are left their natural enemies prevail against them and destroy the last remnant.

Further on they say that a few men, not over thirty in number, threaten the fisheries of Great South Bay, on Long Island, by pounds; and that if the pound men are allowed their way a serious blow will be dealt to the interests of the counties of Queens and Suffolk; that each net will capture, on an average, nine tons of fish per month; that the nets are worked for six months, and nearly two millions of pounds of fish are thus taken in a season by thirty men.

Will you wait until the probable fate of Queens and Suffolk overtakes you? Will you wait until your exhausted waters are left upon your hands a barren possession. Or will you act now and save the estate which nature has given to you?

Weakfish form the staple for summer fishing. They will not bite at a hook until they have spawned. Immense numbers of them are caught every spring in the pounds while they are running past your shores and up the rivers to deposit their eggs. The sport of angling for them is becoming poorer each year. They will soon cease to be found here unless you protect them. The experience of other places will surely be your experience unless you act wisely, and apply the ounce of prevention before the necessity arises for the pound of doubtful cure. Barnegat Bay has suffered from the depredations of these nets, and Mr. Kinzey, of the Ashley House, under date of Oct. 31, 1877, writes:

I fully expect our bill, abolishing all nets of any description, to pass this winter; even owners of nets in the village of Barnegat are in favor of such a bill. They own yachts, also, and in summer make large money by taking out fishing parties. By agencies and the decrease of their business, their interest has been awakened.

In the spirit of intelligent self-interest this appeal is made to you. Your united voices are required for your protection. On behalf of Excelsior Fishing Club—President, Lawrence R. Kerr; Committee: Albert E. Cochran, Peter J. Hickey, John Lalor.

On behalf of Walton Fishing Club—President, David Banks; Committee: Charles Plum, Jr.; L. De G. Brooks. December 1, 1877.

**A FEW TIMELY HINTS.**—The following communication will receive special notice from our readers:

*Editor Forest and Stream*—I have just finished reading a letter in *Turf, Field and Farm*, in which the writer lays the blame of the scarcity of game on the sportsmen rather than want of game laws or lack of their enforcement, and defends the farmer in the practice of netting. We all, I presume, are rather near sighted in these matters, and apt to blame every one but ourselves. There is no question but that the more game there is killed, whether by trap or gun, the less will be left; and no doubt many so-called "sportsmen" make no limit to their killing, and are never satisfied no matter how large the bag, but kill for the sake of large numbers. I have met many such, particularly when angling. With us near New York, the greatest trouble I find is the fact that so many, while out shooting woodcock, kill both quail and grouse, so that the law-observing sportsmen find the berries all broken up when the time comes to shoot them. It is impossible to prevent it as long as we have the odious summer woodcock shooting. Nine out of ten sportsmen profess to think it no pleasure to shoot woodcock in hot summer weather, but do it because they are afraid some one else will kill them if they do not. I have had much experience in trying to enforce game laws both in New York and New Jersey, and believe the following plan would increase our stock of game, viz.: Do away with summer woodcock shooting, or, if absolutely necessary, have only two weeks of it in July. Then have no upland shooting until Oct. 1. Sportsmen would not take advantage of it to shoot quail that are too small. As it is, law or no law, poachers will shoot them when out for woodcock. If there was no ruffed grouse woodcock or shooting before Oct. 1, there would be no excuse for any one to be seen with dogs and gun, and the quail would be the gainers. There should also be a State Game and Fish Commissioner, who should have power to bring suits in any part of the State. He at least would have no fear of having his barns burned, etc., and would be a great check on the killing and transporting of game out of season.

Yours truly, W. HOLBERTOX, President Hackensack Association for the Protection of Game and Fish.

**THE LEAVITT SALE OF RARE BOOKS.**—We give a few of the prices of the most remarkable books sold by the Messrs. Leavitt last week: Belloni de Aquilinus, 1,538, \$11; Blome, Gentleman's Recreations, 1686, \$19; Oppian's Halieutics, 1732, \$5; Ronald's Flyfishing, \$7; Scrope, \$10.50; Walton and Cotton, \$5; Yarrell, \$5.

## The Rifle.

### MEETING OF THE N. R. A. DIRECTORS

A special meeting of the National Rifle Association was held on Nov. 10th, Judge N. P. Stanton, the President, in the chair. The board went into a Committee of the Whole, and Hon. D. W. Judd took the chair to complete the investigation of the charges against Gen. F. F. Millen for disobedience of the orders of the Superintendent of the range at Creedmoor. After testimony was heard the board went into executive session, when a resolution was adopted providing that as Gen. Millen had been guilty of "misconduct upon the range," and that as the misconduct had been likely to endanger the welfare and character of the association, his membership was forfeited.

The range committee did not vote.

The resolutions were as follows:

*Resolved*, That Gen. Millen has been guilty of misconduct upon the range of the Association.

*Resolved*, That the said misconduct being likely to endanger the welfare and character of the Association, the membership of said Gen. F. F. Millen in the Association is declared forfeited, as provided in Rule 7, Art. IX. of the By-Laws, which provides that,

"Any member whose conduct shall be pronounced by vote of the Board of Directors to have endangered, or be likely to endanger, the welfare, interest or character of the Association shall forfeit his membership."

The next task of the Directors was a far more agreeable one, as under the leadership of Gen. Shaler, the whole board proceeded to the Astor House, where, in a private parlor, an elegant piece of work in illumination and script showed the care which had been taken in preparing the engrossed resolutions to be presented to Gen'l Woodward in recognition of his services on behalf of the association. The work was of a much higher grade than the usual black-ink pen flourishes so familiar in engrossed resolutions. The conventional mode was not entirely dropped, but the merits of color and the advantages of a chaste treatment were recognized, and carried out in the beautifully framed work of art before them. As the Board and guests gathered in the little parlor, Gen'l Shaler did the graceful in the presentation lines, and said:

GEN'L. WOODWARD.—You will remember that shortly after you retired from the office of Vice-Pres., the Directors expressed a desire to convey to you in some appropriate manner their appreciation of your services to this Association from the date of its organization. In pursuance of that desire, they appointed a committee, which I have the honor to now represent, to draft and present to you suitable resolutions. The Committee could not hope to more than partially express in the resolutions the obligations which the riflemen of America, as well as your associate directors, were under to you for the aid you contributed in giving character and permanence to this favorite amusement, and we trust that your estimate of our personal esteem will not be measured by so imperfect a standard as these resolutions furnish—but such as they are, we present them to you with the hope that, while they fail to express our sentiments as fully as we might wish, you will receive them, and give them a place in your home where your family and friends may, in time to come, as well as the present, learn by them that your associates were not entirely unmindful of the services you rendered in permanently establishing rifle shooting in America. And if their perusal shall be the means, in the slightest degree, of encouraging others in the exercise of those noble qualities of honesty and uprightness which have been, and are, so conspicuous in your character; or if, in after years, you shall find in them a reminder of pleasant associations, then this testimonial shall not have been prepared in vain.

Mr. President and gentlemen, your committee now propose the health of Gen. John B. Woodward. May he long live to enjoy the respect, the esteem, and the love of friends no less than those which now surround him.

And then, when the champagne had duly trickled down all the throats present in honoring the toast, Gen. Woodward briefly responded, as follows:

GEN. SHALER AND GENTLEMEN.—You are too well acquainted with me to know that I shall be able to give expression to my feelings of gratification in having been esteemed worthy of being the recipient of this beautiful testimonial; and I esteem not less highly the pleasant words with which it has been accompanied.

I cannot fail to cherish this testimonial most deeply. I feel, however, that it comes to me too much undeserved. (No, no.) While I have been associated with the National Rifle Association from its beginning, it has always been in a very humble capacity. I shall look back—as some of you can—as having been one of the exemplars of rifle shooting in this country, and, I might say, in the world. The grounds at Creedmoor bear witness, in their arrangement, ornamentation and preparation, to the care and fidelity, the hard working zeal of Gen. Shaler and other members of your board. However, I can claim that, during the fall and spring meetings, I have striven to conduct them in such a way as to redound to the credit of the Association. I shall cherish the names inscribed upon the parchment because I have known you all so well. I can only say, in conclusion, that I cannot say what I ought to say in this connection.

The text of the testimonial read as follows:

Whereas, Major General John B. Woodward was one of the incorporators of the National Rifle Association, and has since the date of its organization been an active and valuable official therein, filling with honor and credit to himself, and with great benefit to the Association, the responsible offices of Treasurer, Vice-President, Chairman of the Finance and Range Committee, and Chief Executive Officer at important prize meetings; and

Whereas, in the discharge of the varied and arduous duties of the positions above named, and in his intercourse with the officers and members of the Association, Gen'l. Woodward has constantly exhibited the rare qualities of a zealous, competent and faithful official, combined with a courteous and gentlemanly demeanor toward all; and

Whereas, General Woodward has, by the energy and ability displayed in rendering his voluntary services, greatly en-

a rock, and he is always among the most reliable of riflemen. His brilliant scores have been brought about by hard work, combined with good judgment.  
Score at 800 yards, 143; 900 yards, 144; 1,000 yards, 184.  
Total, 421.

ISAAC LEROY ALLEN.

This gentleman is a New Yorker, and is now in his thirty-fifth year. In rifle shooting he now occupies a most distinguished position. In coolness, absence of flurry and readiness he has no equal. His build is slight, but he is well put together, and has clear blue eyes. Mr. Allen's position the recumbent one, with the butt of his rifle under his arm, his left hand grasping his barrel.  
Score at 800 yards, 141; 900 yards, 139; 1,000 yards, 139.  
Total, 419.

HERBERT S. JEWELL.

Mr. Jewell, like the majority of the team, is a New Yorker, and is to-day about thirty-three years of age. In height Mr. Jewell is some five feet six inches, weighs about 150 pounds, and has blue eyes, with light hair. Mr. Jewell is Major of the Second Division N. G. S. N. Y., being Inspector of Rifle Practice. Mr. Jewell's labors in rifle shooting have been long, and the position he has assumed among leading American riflemen is due to steady practice.  
Score at 800 yards, 143; 900 yards, 131; 1,000 yards, 145.  
Total, 419.

FRANK HYDE.

Mr. Hyde was born in Connecticut, and has a height of six feet four inches, weighs 220 pounds, and is about thirty-two years of age. Mr. Hyde was once engaged in journalism, and when the civil war broke out, enlisted in the fifth Wisconsin Volunteers. Mr. Hyde has had a good deal of practice, and is counted among our steadiest shots. Very cool and deliberate, misfortune has no effect upon him. Mr. Hyde's scores are invariably excellent, and he can always be relied upon for a high average at all distances.  
Score at 800 yards, 143; 900 yards, 138; 1,000 yards, 133.  
Total, 414.

W. H. JACKSON.

Mr. Jackson entered the service of the United States, April, 1861, as Lieutenant in the First Battalion of Infantry, which afterwards became the Thirtieth Regiment Massachusetts Volunteers. For personal bravery Lieutenant Jackson was promoted to a Captaincy. In December he took part in the engagements at Winchester and Sugar Mountain, at Rappahannock Station and Thoroughfare Gap. Mr. Jackson was discharged for disability in March, 1863, and returned to his profession of civil engineer, going to Colorado in 1864. Returning to Boston in 1863, he has ever since been engaged in engineering duties. Mr. Jackson first commenced rifle shooting in the spring of 1876, at 200 yards, off-hand. His long-range practice only dates from the spring of 1877. Mr. Jackson is six feet and one-half inch in height, and weighs some 115 pounds, has dark hair and dark eyes. His age is about forty-five. His physique is superb, and Mr. Jackson is among our steadiest riflemen.  
Score at 800 yards, 139; 900 yards, 135; 1,000 yards, 133.  
Total, 407.

WHERE WE DIFFER FROM COL. PEEL.

We beg to call attention to some oversights in Lieut.-Col. C. L. Peel's letter of the 8th October, which we copied from the *Volunteer Service Gazette*, and which letter appeared in our last issue. The gallant executive officer of the English N. R. A., we are pretty sure, makes several mistakes in this paragraph. Perhaps Colonel Peel was wrongly informed:

They (the Americans) load their cartridges on the ground, inserting the bullet, which has a lubricated paper wrapper, but no wad, very slightly (1-16th of an inch only) into the shell. Old shells are considered the best until they get out of shape. Some men prefer, for match purposes, those that have been used twice, others thrice; and some, I understand, use the same shell over and over again.

In the first place, as a rule, ninety-nine times in a hundred cartridges are not loaded on the ground. The bullet has not a lubricated paper wrapper, it is the barrel which is lubricated, and not the paper. Again, Col. Peel says there is "no wad." In the International match Messrs. Jewell, Blydenburgh, Allen, Bruce and Hyde all used wads, and always use them. Again, Colonel Peel says, "Old shells are considered the best until they get out of shape." The opinion of all the leading American riflemen is that new shells are the best. We have not just now the opportunity to find out how many of the team used old cartridges, as some of the gentlemen do not reside in New York; but we are quite positive that those using old shells were very much in the minority. We know that Messrs. Jewell and Blydenburgh used new shells. The best shooting with a Remington is supposed to be brought out with new shells. But a Sharp can use old shells. Mr. Allen did use old shells. The use of old shells is rather exceptional than general, where great accuracy, as at a match, is wanted.

We think it is Mr. Rigby who says that the American breech-loader is a kind of hybrid arm, loading at the muzzle. We suppose this statement has its origin in the fact that Mr. Webber did load in this way at the muzzle. The reason for this was because Mr. Webber had had no time to prepare his cartridges.

We advance these statements with no idea of finding the least fault with Colonel Peel's admirable letter, but so that we may throw all the possible light we can on the subject. If ever a new match takes place, which we sincerely trust may happen, we want our gallant adversaries to be fully informed

on every point. The question of *dirty powder*, very much commented upon by English experts, is truly stated. We do use, and purposely, a slow burning powder, which leaves its traces behind in the barrel. And why? Because it not only produces the best effects, but is cheap. It makes no matter of difference in our breech-loading system what kind of powder is used, because, with a great deal of practical good sense, our breech-loading rifle manufacturers make arms which can be easily and thoroughly cleaned. Absolutely accurate scientific rifle shooting, in which we excel, necessitates one system of loading with peculiar charges, while a military arm wants something else. Our breech-loading military arms, we can inform Colonel Peel, can be fired an indefinite number of times, and are made on the same principles as the Remington and Sharps; and they never clog. We do not entertain the idea that American target rifles have any lower trajectory than the Rigby or Metford, but we do believe that the improved Springfield rifle, such as are furnished to our regular army, has a *lower trajectory* than the arms used by the British Regulars. Certainly our ordnance officers think so, and have published statements to that effect, not in so many words, but in their reports on the various trajectories made by the different rifles used in foreign service.

Sea and River Fishing.

FISH IN SEASON IN DECEMBER.

Black Bass, *Micropertus salmoides*; Yellow Perch, *Perca flavescens*.  
*M. nigricans*; Sea Bass, *Sparus ocellatus*.  
Pike or Pickerel, *Esox lucius*. White Perch, *Morone americana*.

FISH IN MARKET.—Bass, large, 25 cents per pound; small, 20; smelts, 20; bluefish, 15; salmon, frozen, 30; mackerel, 30; shad, \$1.50 cents each; weakfish, 15 cents; Spanish mackerel, 30; green turtle, 20; terrapin, \$15 a dozen; frost-fish, 8 cents per pound; halibut, 18; haddock, 6; codfish, 6 to 8; blackfish, 12 to 15; flounders, 12; eels, 18; lobsters, 10; sheephead, 25; scallops, \$1.50 per gallon; soft clams, per 100, 30 to 60 cents; whitefish, 20; pickerel, 15; sunfish, 10; salmon trout, 18; hard crabs, per 100, \$3.00.

A few bluefish have been taken off the coast of North Carolina. They are the first captured this winter. Shad and a few sheephead are arriving by steamer from Savannah. Cod very plenty off Rockaway.

A FOUND NET.—That our readers may understand just what a pound net is, of which special complaint is made in another part of this issue, we republish the following description and illustration from the Winona (N. J.) *Advance*:

The line A represents a net of about six hundred feet in length, stretched across one of the channels. The dots along the line represent strong wooden stakes, driven firmly into the mud or sand, and upon which a net is supported and extending from the bottom of the channel to the surface of the water.

B represents a net surrounding a space of probably half an acre, firmly secured to stakes at the end of line A, the net being so arranged as to be drawn up something like a purse.

C represents the wings of the net, staked out so as to aid in conducting the fish into B.

At the junction of the lines A and C there is a small funnel-shaped opening through which the fish are conducted into the pound B, and when in there are unable to get out.

The fish in moving about follow the channels usually, this net being set across the channel so that when the fish are moving up with the flood-tide or down with the ebb they strike the net on line A, and naturally swimming along to find a place either to get around it or through it are conducted into the pound B.

This device for the depletion of waters of fish is kept for months in place and visited every day, sometimes twice a day

by the owners with a large boat, which is taken into pound B, the net "pursed up" and the fish scooped out. Immense quantities of fish are in this way prevented from reaching the streams emptying into the bay.

MOVEMENTS OF THE FISHING FLEET.—The arrivals the past week have been confined to seven vessels from the Banks, three from Georges, one from the Bay St. Lawrence, and two from off shore mackerelling trips. Total number of arrivals, 13. The receipts have been about 135,000 lbs. Bank halibut, 30,000 lbs. Georges cod, 145 bbls. Bay mackerel, and 85 bbls. Shore mackerel. The Bay fleet are all in, and there is but one more Shore mackerellman to arrive. There are four Bankers still absent on salt trips, and the fleet seeking halibut is small.—*Cape Ann Advertiser*, Dec. 7.

NEW YORK.—*South Brooklyn*, Dec. 4.—The Warrior Fishing Club made their annual fishing excursion to Fire Island to-day, and between the hours of 10 A. M. and 4 P. M. took 100 codfish, aggregating a weight of over 800 lbs.

TOWA.—*Anamosa*, Dec. 6.—We are informed that a man living near Storm Spring, some distance up the Wapsie, last week speared three California salmon averaging seven pounds each.—*The Eureka*.

—We have seen the split bamboo rods advertised by Mr. Holberton, in another column, and, as far as we can judge, they are all that they are represented to be.

MANUFACTURE OF FISH HOOKS.—How long ago fish hooks were made in and around Redditch, in England, no one knows, possibly contemporaneous with the manufacture of needles; certainly for the last two centuries. Redditch fish hooks have been famous, not only for ocean fishing, but for whipping streams for the dainty trout. Quite possibly Dame Berners or Izaak Walton used good Redditch fish hooks. The making of fish hooks has to be a very precise and particular business. After the best steel wire has been cut into lengths, the barb, or, as it is technically called, the beard, is cut with a chisel or a sharp tool under proper guides and guards to prevent it going too deep. Then the point is filed, the bend made (and there is no end of bends) and the shank is either marked, notched, flattened or looped. Then the hook is tempered, scoured and blued. Does this end the business? No, not by a great deal. Reader, did you ever strike a good sized fish, say a salmon, and feeling your line growing taut, twanging like a violin string, suddenly become aware of something limp and loose in your line? Then when you reel up, and the horrible fact becomes visible that your hook has broken in twain! were you profane on such an occasion? We trust not. Well, to guard against any such accidents, all reliable fish-hook makers test hooks, giving to each one a strain twice as powerful as it is supposed any hook can ever be put to. Just such hooks as we describe are manufactured at Redditch by Joseph Warren at the Eagle Mills; and Messrs. Abbey & Imbrie, 48 Maiden Lane, are the sole agents in the United States for the needles, and most particularly for the fish hooks.

CONDITIONS FOR BASS FISHING.—In a number of your paper dated Nov. 15, "Splasher" recommends sportsmen to give more of their experience in fishing, as to weather, bait, time, etc., and I think he expresses the wish of a large number of your readers who are lovers of the sport. In regard to shiners for bait, I prefer them during the month of October, but for September, I think helgramites the best, especially in fishing small streams, where you can fish the entire stream from the shore. I always prefer to catch my bait as near the fishing grounds as possible, as you are more apt to get the kind of bait the fish prefer. In regard to small *versus* large minnows, I had a like experience to that described by "Splasher."

It was about the 1st of September, the water was colored a little, but not muddy. My minnows, with the exception of three or four, were small, probably an inch long. My largest fish were taken with the small minnows. I used my large minnows first, but took only fish weighing probably a half pound, although I took some weighing four and a quarter pounds.

In your answers to correspondents, "Splasher" asks the best way to hook the living helgramite. My method is to put it on the ground with the head toward you, place a finger of the left hand on the cap of the neck, and with the right hand insert the point of the hook under the cap of neck from behind forward till the barb comes through next the head on the same side. If hooked carefully it does not injure the life of the bait.

Let us hear from other fishermen more about black bass, their habits, how to catch them, bait, etc. ENTHUSIAST.

WORMS FOR BAIT.—A correspondent sends us this memo randum of an enterprising worm seller: "In the summer of 1875, when at Lake Tahoe, a large expanse of water 6,000 feet above the sea, on the eastern slope of the Sierra Nevada Mountains, I observed at a small landing the following inscription on a sign board: 'Boats and fishing lines to hire; angle worms for sale at 25 cents per dozen.'"

THE LITERATURE OF ADVERTISEMENTS.—A gentleman, high in office in the U. S. Treasury Department at Washington, volunteers to say, casually, in a private letter to the editor:

By the way, your advertisements are a very interesting feature of the paper. I am certain that I read each one in each issue, not because I expect to buy everything or anything, but because it is a pleasure to know what articles and kinds of articles are made, and where, etc.

We make no especial reference to holiday goods, as most journals do; we simply invite a general examination of our columns. Any person desiring presents for wives, husbands, sons and daughters or mothers-in-law, will find as varied an assortment there as in any other journal whatsoever, and the goods are most invariably of a better quality than those advertised in miscellaneous sheets.

—'Tis the work

Of many a dark hour and of many a prayer  
To bring the heart back from an infant gone,  
sings a poet. Well? there would be less need of this effort if parents exercised more care in certain little matters. For example, by using B. T. Babitt's Toilet Soap they obviate the possibility of certain diseases that insidiously come in through the skin. The hygienic purity and excellence of this new toilet soap make it a most desirable thing for use.—*Ed.*

## Yachting and Boating.

### HIGH WATER FOR THE WEEK.

**VOYAGE OF THE PAPER CANOE.**—This is the title of a book by Mr. N. H. Bishop, whose contributions to this journal have made him known to our readers. The volume, soon to be published simultaneously by Lee & Shepard, Boston, and houses in London and Edinburgh, will be descriptive of Mr. Bishop's famous canoe cruise; and its value is to be enhanced by correct charts of the coast contour, especially prepared for Mr. Bishop by the U. S. Coast Survey Bureau. We shall welcome the book as an important contribution to its class.

**A BOAT FOR FLORIDA WATERS.**—*Editor Forest and Stream*.—Everything here hinges on the wind. What we want is a boat drawing very little water, will head well and not go sideways like a crab. Will "Nauticus" give us a plan for a flat-bottom boat, something on the "Sarpia" order, with two sails, length 21 or 22 feet and narrow, with plenty of flare to the sides; bottom to go on crossways without knees so as to be as light as possible? We have on Indian River a number of short "pumpkin seed" yachts, 14 and 16 feet long, and if it blows hard and much sea on they do nothing at all but pound when they have to beat. They will be all day going nowhere. When sailing before the wind they are so wrapped up in canvas that you want a yoke of cattle hitched to the tiller to steer them. Your boat articles take with all here, and I lend them out and they are read and re-read till they are read up. M.

Banana River, Fla., Nov. 28.

—J. H. Rushton, the manufacturer of the best light cedar boats in the country, is erecting a new building on Water street, near the stone blacksmith-shop, to accommodate the increasing demand of his business.—*Plaindealer*, Malone, N. Y.

**COLUMBIA YACHT CLUB.**—The Columbia Yacht Club held their annual meeting on Tuesday night last for the purpose of electing officers for the incoming year. The gentlemen chosen to fill the respective offices were the following: Commodore, J. S. Baker; Vice-Commodore, R. McWhinnie; Secretary, Charles H. Armstrong; Treasurer, Joseph A. Weaver; Measurer, George Heap; Steward, P. Hansen; J. R. Stinson, John Frick, Chairman; Peter Valentine, A. P. Worman, A. H. Rogers and A. T. Stephens; Finance Committee, John Frick, Chairman, A. H. Rogers and Lewis Frick, Jr.

**NEW YORK ATHLETIC CLUB.**—There will be a grand winter meeting of this club at Gilmore's Garden, on the evenings of Jan. 4 and 5. The running, walking and other contests are open to all amateurs. Entries close Dec. 27. For all particulars address the Secretary, A. H. Curtis, P. O. Box 8, 101, New York City.

**NIBLO'S—THE THREE GUARDSMEN.**—At Niblo's Garden Alexander Dumas' grand drama of the Three Guardsmen commenced on Monday last, and will be continued throughout the week. D'Artagnan, Athos, Aramis and Porthos have held their ground for many a year, and their numerous adventures, their quarrels and escapades have furnished untold amusement for almost a generation of play goers. The piece is admirably mounted; the performers play their parts with spirit, and for those fond of the romantic drama, and play with no end of action, we know of no place of amusement where an evening can be more pleasantly passed than at Niblo's Garden.

**BEH LIVING.**—*Editor Forest and Stream.*—Perhaps some of your numerous readers may have read Cooper's "Bee Hunter," and been interested in the mystery of bee tracking. If so, it may interest them to know that lining bees is practiced to some extent in the vicinity of Windsor, Conn., and that often the hunters are rewarded by securing a good many pounds of honey of a flavor surpassing that of domestic bees. A box with two compartments is prepared, with sliding door giving admission from one to the other. A hinged door opens from the outside in which the bee is made a captive. Now open the slide, and the first apartment being dark and the other lighted with a glass window, the bee quickly crawls through, and commences filling up from the honey placed in it. It takes him from two to three minutes to load up. Now open the door and up he goes into the air,

when circling round for a few minutes he arts off with the velocity of a bullet in the direction of his tree. Note the direction taken by the bee, and stand perfectly still timing in the meantime to see whether the distance be long or short to the bee tree. It takes him about the same time to deposit the honey as it did to receive it, and if he is not one more than six or eight minutes the distance to the tree is not great, for they fly with great velocity. On his return he, perhaps, brings one or two companions with him, and they go into the box. Now shut down the cover and start in the direction taken by the bee in his first flight, carrying the box with you in which the bees are engaged in loading up again. As soon as they are ready, halt, and open the door; instantly the bees rise, describing the same circles in the air, and then dart off again in a direct line for the tree. Go in any direction you choose, north, east, south or west the bee is never puzzled as to the right direction. His instinct is unerring, and no line can be drawn straighter than the bee flies. Now halt again till his return, when the same operation is repeated; the time of his flight and return grow shorter and shorter, and soon you are lead directly to the tree, where in the hollow trunk lies stored the luscious sweets. The tree found, with the aid of sulphur smoke you destroy the bees and take out the honey. Some fifty pounds were taken from a tree near here this fall, and last year a tree was found that yielded much more. I have only given the above in outline, but hope some one will give us the subject more in detail relative to the habits and haunts of wild bees in other sections of the country. BEE HUNTER.

Windsor, Conn.

**SLAUGHTERING CATTLE WITH DYNAMITE.**—The advantage claimed for the new method of slaughtering cattle with dynamite are the instantaneousness and certainty with which the result is accomplished. The old methods require a large amount of experience to be practiced with dexterity, and even then are not free from a certain degree of cruelty. The dynamite method is coming into favor in some of the European abattoirs, and experiments have been made demonstrating its possibility. The London Times has an account of recent trials in London:

To show the safety with which the explosive (Noble's dynamite) can be employed, small quantities were first burnt without any explosion. The charge with which the cattle were afterward killed consisted of about an ounce of a pinkish pasty substance, into which had been plunged a detonator on a fuse. The bullocks bought that morning in the market were led into Mr. Thomas Cross's slaughter-house, and tied up to posts there in the ordinary way. The operator, fondling them, passed across the forehead a fillet of string secured round the horns, and so arranged that mid-way between the horns and eyes, and thus in the centre of the forehead, the charge of dynamite was placed, which formed the central and only ornament of the fillet. Then the fuse was fired, and in two cases the bullock was killed at once by the explosion of the ounce of dynamite. A hole was made in the skull by the force of explosion, but the concussion was entirely local, and people standing close by felt nothing. They heard a loud report. The dynamite may be applied at leisure to the proper place, and the operator ought to be able to count on keeping it there. An objection to its use is in the report which it makes. The second bullock was obviously frightened by the noise of the explosion of the first charge. The three animals were killed in nine minutes at the expense of about 8d. In the Black Country, where dynamite is common as a blasting material for mines, it is said to be already in practical use in the slaughter-house.

**CATFISH WITH AN EAR FOR MUSIC.**—In another column the zeal's claim to a musical taste is called into question. However that may be, here is an unquestionable instance of piscatorial horror of discord, which a correspondent gives us:

"My father constructed a pond near our dwelling-house, and stocked it with fish, especially with catfish and sunfish. These in time, by kind treatment, became so tame that they would take food from our hands, and even jump out of the water a short distance to obtain it. This pond was surrounded by a gravel walk. During many happy hours my pole was employed in catching fish in the creeks, which were carried alive in a tin pan to this pond. On one occasion, having placed the tin pan on the gravel walk prior to the transmutation of the fish to the pond, I moved the pan a few inches, which movement was accompanied with a harsh, discordant sound, caused by the friction of the tin on the gravel, and also attended by a spasmodic motion on the part of the fish, which jumped out of the water in the pan and fell up on the ground. It was clearly demonstrated that the fish did not relish such discordant music, nor did they hesitate to testify their disapprobation of it. I immediately put the fish in the pan again, and subsequently repeated the same operation several times with the same result."

MESSRS. TIFFANY & CO.,  
UNION SQUARE, NEW YORK  
City, have made extensive preparations for the approaching  
HOLIDAYS.

Their Stock of Diamonds, Watches, Jewelry, Silverware, Bronzes, Pottery, Stationery and Fancy Articles, is the largest and most varied in this country, and includes novelties from abroad and choice goods of their own manufacture, not to be found elsewhere.

A special department has been organized for sending goods to persons at a distance from New York, and any one known to the house, or naming satisfactory references, can have careful selections sent for inspection.

They have lately published a little pamphlet containing a condensed account of each department, and lists of articles appropriate for presents, which they will send to any address on request.

## Piper Heidsieck AND PIPER "SEC."

For Sale Everywhere.

JOHN OSBORN, SON & CO.,

FUR-LINED CIRCULARS AND CLOAKS,  
FUR ROBES, MATS, COLLARS & GLOVES,  
ALL IN LARGE ASSORTMENTS AND AT  
LOW PRICES.

N. B.—Orders by mail or information desired will receive special and prompt attention. Dec 13 '95

The New AIR PISTOL shoots darts and slugs. Black chromed six darts, 50 slugs, \$1.75. Full Nickel Plate, \$2.50. Sent prepaid on receipt of price.  
GEO. M. JACOBS & CO.,  
Dec 13 121 Duane Street, N. Y.

## The Fibre Wad.

Having made recent improvements in cutting and indenting our wads, we can recommend them as being equal to the best imported felt wads.

They will not take fire nor blow to pieces, and will hold the charge securely in metallic shells.

Sample of No. 14 to No. 10 sent for.....25c  
Sample of No. 8 and 9 sent for.....30c

DELAWARE CARTRIDGE CO.,  
Wilmington, Del.

## For Sale.

A VERY fine made-to-order Scott, 10-bore, loader, pistol-grip; weight, 9 1/2 lbs., new; owner sells because he wants a lighter. Cost \$125 with case. Will sell low for cash. Address HENRY ALTEX, GRAND, Sixth street, North Seventh street, Brooklyn, E. D., N. Y.

## FLORIDA OUTFITS.

Send 10 cents for illustrated catalogue of SHOOTING, FISHING and CAMPING GOODS, with directions for camping, shooting and Bogardus' rules for glass ball shooting, etc.

TENTS, CAMP STOVES, PORTABLE RUBBER GOODS, JACK LAMPS, Etc.

Suits of all kinds, including velvet, eroy, leather, etc. Also a new style of duck soft and pliable.

Fox, Webley, Scott and other breech-loading guns and rifles. Ammunition of all kinds.

## SPLIT BAMBOO RODS.

I am able to offer to sportsmen a very superior article in split bamboo rods for fly and bass fishing and trolling. Call and examine them. Red warranted. With skeleton reel-hands, solid reel-bands, \$23, with tip case, extra tip bag.

These rods have been well tested, and equal, if not superior, to any in the market.

## FLORIDA OUTFITS A SPECIALTY.

A supplement to my illustrated catalogue ready this week, containing a number of new ideas for sportsmen, including price lists.

## SKATES.

No sportsman should be without "THE SPORTSMAN'S DIARY AND NOTE-BOOK." Blank slate for all kinds of shooting. Rules, etc., bound in leather—handy size for the pocket. Sent on receipt of 50 cents.

Send no money by mail; remit by draft or order.

W. HOLBERTON'S SPORTSMEN'S EMPORIUM,

P. O. Box 5, 109, 102 Nassau St., N. Y.

## SHONINGER ORGAN

PRONOUNCED UNANIMOUSLY AS THE

## Best Instruments.

Their comparative excellence is recognized by the Judges in their Report, from which the following is an extract:

"The B. SHONINGER ORGAN CO.'S exhibit the best instruments at a price rendering them possible to a large class of purchasers, having combination of Reeds and Bellows producing novel and pleasing effects, containing many distinctive improvements, and stand longer in dry or damp climates, and liable to get out of order, all the boards being made of three-ply, put together so it is impossible for them to either shrink, swell or split." THE ONLY ORGANS AWARDED THIS RANK.

This Medal and Award was granted after the most severe competition of the best makers, before one of the most competent juries ever assembled. New styles and prices just issued, which are in accordance with our rule, the BEST ORGAN is the least money.

We are prepared to appoint a few new Agents. Illustrated Catalogues mailed, postpaid, upon application to

503 Broadway, New York.

## NEW YORK SHOOTING COAT.

A stylish, handsome Coat. First-class in every particular. Pleasant to wear, durable, and in the the cheapest.

MADE OF BROWN VELVETEEN.

Pockets and lining made to take out, so that it may be worn for early fall and winter shooting. (Horace H. Bagg, says: "It is my idea of a shooting coat. I have worn them for several years, and would have none other.") Price for Coat, \$25; Vest, \$6.50. Also the best brown corduroy pants at \$10 per pair. Also the one grade, as the cheapest goods do not turn briars and will not give satisfaction.

Also, in addition to the above, I am making a Waterproof Canvas Suit, cut same style as the velvet; goods, not stiff and hard, but soft and pleasant to wear; guaranteed to turn water. Sportsmen have seen it say it is The Best Yet. Coat, \$6.50. For full suit, \$14.00. I also make the sleeveless Vest with sleeves if desired. Rules for measurement and samples sent upon application.

F. L. SHELDON, Rahway, N. J.

For Sale by Dealers in GUNS and SPORTSMEN'S SUPPLIES.
